Description

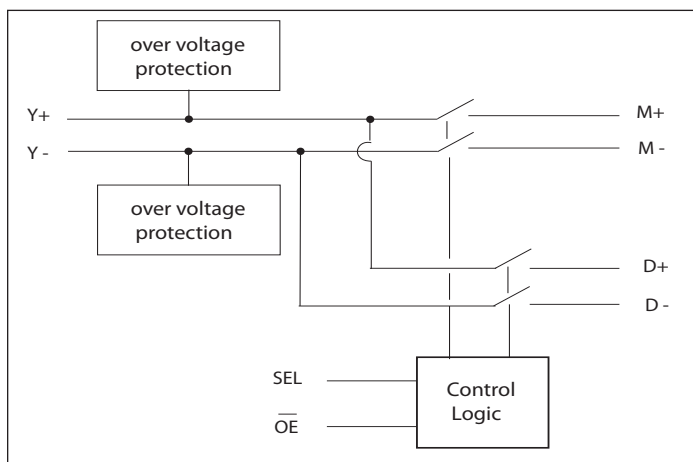

The DIODES™ PI3USB102E is a single differential channel 2:1 multiplexer/demultiplexer USB 2.0 Switch. Industry leading advantages include a propagation delay of 250ps, resulting from its low channel resistance and I/O capacitance. PI3USB102E is bidirectional and offers very little attenuation of high-speed signals. It is designed for low bit-to-bit skew, high channel-to-channel noise isolation and is compatible with various standards, such as High Speed USB 2.0 (480 Mb/s).

The PI3USB102E offers over voltage protection for the Y+/Y- pins as per the USB 2.0 specification. With the chip powered on or off if Y+/Y- pins are shorted to VBUS (5V +/- 5%), M+/M- and D+/D- outputs are clamped to provide voltage protection for downstream devices.

Application

- Routes signals for USB 2.0
- PC, Notebooks and Hand-held devices

I _{DD}	Power Supply Current	V _{DD} = 3.3V, \overline{OE} = GND, V _{SEL} = GND or V _{DD}		1	2	uA

Notes:

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- V_{DD} = 3.0 - 5.5V, T_A = 25°C ambient.
- Measured by the voltage drop between Y+/Y- and the lower of M+/M- and D+/D- at indicated current through the Switch.
- When the voltage at Y+/Y- is greater than V_{DD} + 0.2V, over-voltage protection limits the output voltage at M+/- and D+/- to protect connected devices from damage.

Notes:

- For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
- Typical values are at V_{DD} = 3.3V, T_A = 25°C ambient.
- This parameter is determined by device characterization but is not production tested.
- Time duration for output voltage higher than V_{OVP} when input is connected to 5V.
- Output voltage observed at M+/M- and D+/D- during over-voltage condition.
- Tested using a 750 kHz square wave with t_r = 75 ns and t_f = 75 ns.

Switching Characteristics

Parameters	Description	Test Conditions ⁽¹⁾	Min.	Typ.	Max.	Units	
t _{PD}	Propagation Delay ^(2,3)	See Test Circuit for Electrical Characteristics		0.25		ns	
t _{PZH} , t _{PZL}	Line Enable Time - SEL, \overline{OE} to D(+/-), M(+/-)		0.5		50		
t _{PHZ} , t _{PLZ}	Line Disable Time - SEL, \overline{OE} to D(+/-), M(+/-)		0.5		11.0		
t _{BBM}	Break Before Make Delay			9.0			ns
t _{SKb-b}	Output skew, bit-to-bit (opposite transition of the same output (t _{PHL} -t _{PLH}) ⁽²⁾)				8		20

Notes:

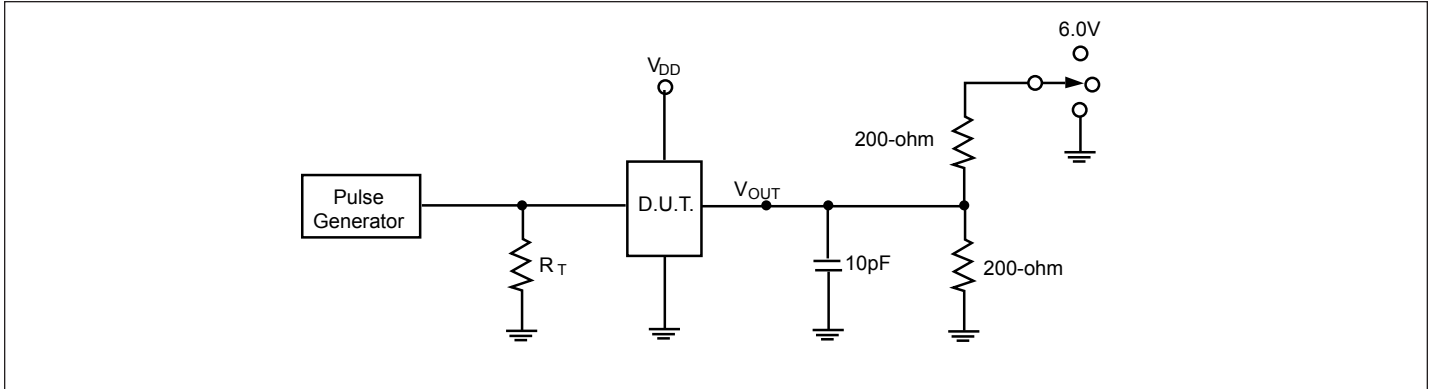

1. For max. or min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Guaranteed by design.
3. The switch contributes no propagation delay other than the RC delay of the On-Resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25ns for 10pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagation delay to the system. Propagation delay of the switch when used in a system is determined by the driving circuit on the driving side of the switch and its interactions with the load on the driven side.

The PI3USB102E offers over voltage protection for the Y+/Y- pins to protect from shorts to VBUS (5V). When the voltage on Y+/Y- exceeds V_{OVP} , the voltage at M+/M- and D+/D- is clamped to V_{DSW} within the time T_{OVP} . For rise time of 75 ns (as per USB1.1 and USB2.0 low-speed specifications), T_{OVP} is typically 40 ns. T_{OVP} is smaller for faster risetimes. For example, T_{OVP} is typically 20 ns for rise time of 5 ns.
