

Dual SPDT Analog Switches with Over-Rail Signal Handling

General Description

The MAX4850/MAX4850H/MAX4852/MAX4852H family of dual SPDT (single-pole/double-throw) switches operate from a single +2V to +5.5V supply and can handle signals greater than the supply rail. These switches feature low 3.5Ω or $3.5\Omega/7\Omega$ on-resistance with low on-capacitance, making them ideal for switching audio and data signals.

The MAX4850/MAX4850H are configured with two SPDT switches and feature two comparators for headphone detection or mute/send key functions. The MAX4852 has two SPDT switches with no comparators for low $1\mu\text{A}$ supply current.

For over-rail applications, these devices offer either the pass-through or high-impedance option. For the MAX4850/MAX4852, the signal (up to 5.5V) passes through the switch without distortion even when the positive supply rail is exceeded. For the MAX4850H/MAX4852H, the switch input becomes high impedance when the input signal exceeds the supply rail.

The MAX4850/MAX4850H/MAX4852/MAX4852H are available in the space-saving (3mm x 3mm), 16-pin TQFN package and operate over the extended temperature range of -40°C to $+85^\circ\text{C}$.

Applications

- USB Switching
- Audio-Signal Routing
- Cellular Phones
- Notebook Computers
- PDA's and Other Handheld Devices

Features

- ◆ USB 2.0 Full Speed (12MB) and USB 1.1 Signal Switching Compliant
- ◆ Switch Signals Greater than V_{CC}
- ◆ 0.1ns Differential Skew
- ◆ $3.5\Omega/7\Omega$ On-Resistance
- ◆ 135MHz -3dB Bandwidth
- ◆ +2V to +5.5V Supply Range
- ◆ 1.8V Logic Compatible
- ◆ Low Supply Current
 $1\mu\text{A}$ (MAX4852)
 $5\mu\text{A}$ (MAX4850)
 $10\mu\text{A}$ (MAX4850H/MAX4852H)
- ◆ Available in a Space-Saving (3mm x 3mm), 16-Pin TQFN Package

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	TOP MARK
MAX4850ETE	-40°C to $+85^\circ\text{C}$	16 TQFN-EP*	ABU
MAX4850HETE	-40°C to $+85^\circ\text{C}$	16 TQFN-EP*	ABV
MAX4852ETE	-40°C to $+85^\circ\text{C}$	16 TQFN-EP*	ABZ
MAX4852HETE	-40°C to $+85^\circ\text{C}$	16 TQFN-EP*	ACA

*EP = Exposed paddle.

Pin Configurations and Selector Guide appear at end of data sheet.

Peak Current COM ₋ , NO ₋ , NC ₋ (pulsed at 1ms, 50% duty cycle)		Junction Temperature.....	+150°C
3.5Ω Switch	±200mA	Storage Temperature Range	-65°C to +150°C
7Ω Switch	±100mA	Lead Temperature (soldering, 10s).....	+300°C

Note 1: Signals on IN, NO, NC, or COM below GND are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Dual SPDT Analog Switches with Over-Rail Signal Handling

Detailed Description

The MAX4850/MAX4850H/MAX4852/MAX4852H are low on-resistance, low-voltage, analog switches that operate from a +2V to +5.5V single supply and are fully specified for nominal 3.0V applications. These devices feature over-rail signal capability that allows signals up to 5.5V with supply voltages down to 2.0V. These devices are configured as dual SPDT switches.

These switches have low 50pF on-channel capacitance, which allows for 12Mbps switching of the data signals for USB 2.0 full speed/1.1 applications. The MAX485__ are designed to switch D+ and D- USB signals with a guaranteed skew of less than 1ns (see Figure 1), as measured from 50% of the input signal to 50% of the output signal.

The MAX4850_ feature a comparator that can be used for headphone or mute detection. The comparator threshold is internally generated to be approximately 1/3 of V_{CC} .

Applications Information

Digital Control Inputs

The logic inputs (IN_) accept up to +5.5V even if the supply voltages are below this level. For example, with a +3.3V V_{CC} supply, IN_ can be driven low to GND and high to +5.5V, allowing for mixing of logic levels in a system. Driving IN_ rail-to-rail minimizes power con-

sumption. For a +2V supply voltage, the logic thresholds are 0.5V (low) and 1.4V (high); for a +5V supply voltage, the logic thresholds are 0.8V (low) and 1.8V (high).

Analog Signal Levels

The on-resistance of these switches changes very little for analog input signals across the entire supply voltage range (see *Typical Operating Characteristics*). The switches are bidirectional, so NO_, NC_, and COM_ can be either inputs or outputs.

Comparator

The positive terminal of the comparator is internally set to $V_{CC}/3$. When the negative terminal (CIN_) is below the threshold ($V_{CC}/3$), the comparator output (COUT_) goes high. When CIN_ rises above $V_{CC}/3$, COUT_ goes low.

The comparator threshold allows for detection of headphones since headphone audio signals are typically biased to $V_{CC}/2$.

Power-Supply Sequencing

Caution: Do not exceed the absolute maximum ratings because stresses beyond the listed ratings may cause permanent damage to the device.

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying analog signals, especially if the analog signal is not current-limited.
