## 20-Bit Buffer

### Features

- Low power, pin-compatible replacement for LCX, LPT, LVC, LVCH & LVT families
- 5V tolerant inputs and outputs\*
- 24 mA & 6 mA balanced drive outputs
- Power-off disable outputs permits live insertion
- Edge-rate control circuitry for reduced noise
- FCT-C speed at 4.1 ns
- Latch-up performance exceeds JEDEC standard no. 17
- Typical output skew < 250 ps
- Industrial temperature range of -40°C to +85°C
- TSSOP (19.6-mil pitch) or SSOP (25-mil pitch)
- Typical  $V_{olp}$  (ground bounce) performance exceeds Mil Std 883D
- $V_{CC} = 2.7V$  to  $3.6V$
- ESD (HBM) > 2000V
- CY74FCT163LD244
- Lite Drive™ option for low noise applications

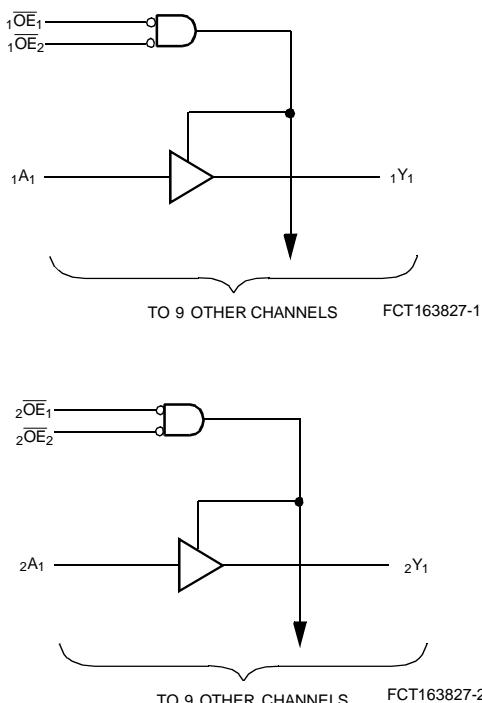

- 6 mA balanced drive outputs
- FCT-A speed at 4.8ns
- $V_{CC} = 3.0V$  to  $3.6V$
- ESD (HBM) > 1100V

### Functional Description

The CY74FCT163827 is a 20-bit buffer/line driver that provides high-performance bus interface buffering for wide data/address paths or buses carrying parity. It can be used as a single 20-bit buffer or two 10-bit buffers. Each 10-bit buffer has a pair of NANDed  $\overline{OE}$  for increased flexibility.

The CY74FCT163827 has 24-mA balanced output drivers with current limiting resistors in the outputs. This reduces the need for external terminating resistors and provides for minimal undershoot and reduced ground bounce. The inputs and outputs were designed to be capable of being driven by 5.0V buses, allowing them to be used in mixed voltage systems as translators. The outputs are also designed with a power-off disable feature enabling them to be used in applications requiring live insertion.

#### Note:

1. H = HIGH Voltage Level, L = LOW Voltage Level, X = Don't Care, Z = HIGH Impedance.
2. Operation beyond the limits set forth may impair the useful life of the device. Unless otherwise noted, these limits are over the operating free-air temperature range.
3. Unused inputs must always be connected to an appropriate logic voltage level, preferably either  $V_{CC}$  or ground.
4. Typical values are at  $V_{CC}=3.3V$ ,  $T_A = +25^\circ C$  ambient.
5. This parameter is guaranteed but not tested.
6. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high-speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parametric tests. In any sequence of parameter tests,  $I_{OS}$  tests should be performed last.
7. Per TTL driven input; all other inputs at  $V_{CC}$  or GND.

### Notes:

9. This parameter is not directly testable, but is derived for use in Total Power Supply calculations.
10.  $I_C = I_{QUIESCENT} + I_{INPUTS} + I_{DYNAMIC}$   
 $I_C = I_{CC} + \Delta I_{CC} D_H N_T + I_{CCD} (f_0/2 + f_1 N_1)$   
 $I_{CC}$  = Quiescent Current with CMOS input levels  
 $\Delta I_{CC}$  = Power Supply Current for a TTL HIGH input (V<sub>IN</sub>=3.4V)  
 $D_H$  = Duty Cycle for TTL inputs HIGH  
 $N_T$  = Number of TTL inputs at D<sub>H</sub>  
 $I_{CCD}$  = Dynamic Current caused by an input transition pair (HLH or LHL)  
 $f_0$  = Clock frequency for registered devices, otherwise zero  
 $f_1$  = Input signal frequency  
 $N_1$  = Number of inputs changing at f<sub>1</sub>  
All currents are in millamps and all frequencies are in megahertz.
11. Values for these conditions are examples of the I<sub>CC</sub> formula. These limits are guaranteed but not tested.
12. Minimum limits are guaranteed but not tested on Propagation Delays.
13. For V<sub>CC</sub>=2.7, propagation delay, output enable and output disable times should be degraded by 20%.
14. See "Parameter Measurement Information" in the General Information section.
15. Skew between any two outputs of the same package switching in the same direction. This parameter is guaranteed by design.
16. The load capacitance is 30 pF for Lite Drive devices. For all others it is 50 pF.
