## DESCRIPTION:

The FCT162543T 16-bit latched transceivers are built using advanced dual metal CMOS technology. These high-speed, low-power devices are organized as two independent 8-bit D-type latched transceivers with separate input and output control to permit independent control of data flow in either direction. For example, the A-to-B Enable ( $\overline{xCEAB}$ ) must be low in order to enter data from the A port or to output data from the B port.  $\overline{xLEAB}$  controls the latch function. When  $\overline{xLEAB}$  is low, the latches are transparent. A subsequent low-to-high transition of  $\overline{xLEAB}$  signal puts the A latches in the storage mode.  $\overline{xOEAB}$  performs output enable function on the B port. Data flow from the B port to the A port is similar but requires using  $\overline{xCEBA}$ ,  $\overline{xLEBA}$ , and  $\overline{xOEBA}$  inputs. Flow-through organization of signal pins simplifies layout. All inputs are designed with hysteresis for improved noise margin.

The FCT162543T has balanced output drive with current limiting resistors. This offers low ground bounce, minimal undershoot, and controlled output fall times—reducing the need for external series terminating resistors. The FCT162543T is a plug-in replacement for the FCT16543T and 54/74ABT16543 for on-board bus interface applications.
