FUNCTIONAL DIAGRAM

Type Features:

- Buffered inputs
- Typical propagation delay:
11.2 ns @ $V_{CC} = 5 V, T_A = 25^\circ C, C_L = 50 pF$

The Harris CD54/74AC193 and CD54/74ACT193 are up/down binary counters with separate up/down clocks. These devices use the Harris ADVANCED CMOS technology. Presetting the counter to the number on preset data inputs (P0-P3) is accomplished by a LOW asynchronous parallel load input (PL). The counter is incremented on the LOW-to-HIGH transition of the Clock-Up input (and a HIGH level on the Clock-Down input) and decremented on the LOW-to-HIGH transition of the Clock-Down input (and a HIGH level on the Clock-Up input). A HIGH level on the Reset input overrides any other input to clear the counter to its zero state. The TCU (carry) output goes LOW half a clock period before the zero count is reached and returns to a HIGH level at the zero count. The TCD (borrow) output in the count down mode likewise goes LOW half a clock period before the maximum count (15 counts) and returns to HIGH at the maximum count. Cascading is effected by connecting the TCU and TCD outputs of a less significant counter to the Clock-Up and Clock-Down inputs, respectively, of the next most significant counter.

The CD74AC/ACT193 are supplied in 16-lead dual-in-line plastic packages (E suffix) and in 16-lead dual-in-line small-outline plastic packages (M suffix). Both package types are operable over the following temperature ranges: Commercial (0 to 70°C); Industrial (-40 to +85°C); and Extended Industrial/Military (-55 to +125°C).

The CD54AC193 and CD54ACT193, available in chip form (H suffix), are operable over the -55 to +125°C temperature range.
