

## DM74LS90 Decade and Binary Counters

### General Description

Each of these monolithic counters contains four master-slave flip-flops and additional gating to provide a divide-by-two counter and a three-stage binary counter for which the count cycle length is divide-by-five for the DM74LS90.

All of these counters have a gated zero reset and the DM74LS90 also has gated set-to-nine inputs for use in BCD nine's complement applications.

To use their maximum count length (decade or four bit binary), the B input is connected to the  $Q_A$  output. The input count pulses are applied to input A and the outputs are as described in the appropriate truth table. A symmetrical divide-by-ten count can be obtained from the DM74LS90 counters by connecting the  $Q_D$  output to the A input and applying the input count to the B input which gives a divide-by-ten square wave at output  $Q_A$ .
