

NUF6001MU

6-Channel EMI Filter with Integrated ESD Protection

The NUF6001MU is a six-channel (C–R–C) Pi-style EMI filter array with integrated ESD protection. Its typical component values of $R = 100 \Omega$ and $C = 17 \text{ pF}$ deliver a cutoff frequency of 120 MHz and stop band attenuation greater than -30 dB from 800 MHz to 3.0 GHz.

This performance makes the part ideal for parallel interfaces with data rates up to 80 Mbps in applications where wireless interference must be minimized. The specified attenuation range is very effective in minimizing interference from 2G/3G, GPS, Bluetooth® and WLAN signals.

The NUF6001MU is available in the low-profile 12-lead 1.2x2.5mm UDFN12 surface mount package.

Features/Benefits

- $\pm 18 \text{ kV}$ ESD Protection on each channel (IEC61000–4–2 Level 4, Contact Discharge)
- $\pm 16 \text{ kV}$ ESD Protection on each channel (HBM)
- R/C Values of 100Ω and 17 pF deliver Exceptional S21 Performance Characteristics of 120 MHz $f_{3\text{dB}}$ and -30 dB Stop Band Attenuation from 800 MHz to 3.0 GHz
- Integrated EMI/ESD System Solution in UDFN Package Offers Exceptional Cost, System Reliability and Space Savings
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Applications

- EMI Filtering for LCD and Camera Data Lines
- EMI Filtering and Protection for I/O Ports and Keypads

Table 1. FUNCTIONAL PIN DESCRIPTION

Filter	Device Pins	Description
Filter 1	1 & 12	Filter + ESD Channel 1
Filter 2	2 & 11	Filter + ESD Channel 2
Filter 3	3 & 10	Filter + ESD Channel 3
Filter 4	4 & 9	Filter + ESD Channel 4
Filter 5	5 & 8	Filter + ESD Channel 5
Filter 6	6 & 7	Filter + ESD Channel 6
Ground Pad	GND	Ground

MAXIMUM RATINGS ($T_J = 25^\circ\text{C}$ unless otherwise noted)

Parameter	Symbol	Value	Unit
ESD IEC61000-4-2 (Contact Discharge) Human Body Model Machine Model		18 16 1.6	kV
DC Power per Resistor	P_R	100	mW
DC Power per Package	P_T	600	mW
Operating Temperature Range	T_{OP}	-40 to 85	$^\circ\text{C}$
Storage Temperature Range	T_{STG}	-55 to 150	$^\circ\text{C}$
Maximum Lead Temperature for Soldering Purposes (1.8 in from case for 10 seconds)	T_L	260	$^\circ\text{C}$

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

ELECTRICAL CHARACTERISTICS ($T_J = 25^\circ\text{C}$ unless otherwise noted)

Parameter	Symbol	Test Conditions	Min	Typ	Max	Unit
Maximum Reverse Working Voltage	V_{RWM}				5.0	V
Breakdown Voltage	V_{BR}	$I_R = 1.0\text{ mA}$	6.0	7.0	8.0	V
Leakage Current	I_R	$V_{RWM} = 3.3\text{ V}$		10	100	nA
Resistance	R_A	$I_R = 20\text{ mA}$	85	100	115	Ω
Diode Capacitance	C_d	$V_R = 2.5\text{ V}, f = 1.0\text{ MHz}$		17	22	pF
Line Capacitance	C_L	$V_R = 2.5\text{ V}, f = 1.0\text{ MHz}$		34	44	pF
3 dB Cut-Off Frequency (Note 1)	f_{3dB}	Above this frequency, appreciable attenuation occurs		120		MHz
6 dB Cut-Off Frequency (Note 1)	f_{3dB}	Above this frequency, appreciable attenuation occurs		185		MHz

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

Theory of Operation

The NUF6001MU combines ESD protection and EMI filtering conveniently into a small package for today’s size constrained applications. The capacitance inherent to a typical protection diode is utilized to provide the capacitance value necessary to create the desired frequency response based upon the series resistance in the filter. By combining this functionality into one device, a large number of discrete components are integrated into one small package saving valuable board space and reducing BOM count and cost in the application.

Application Example

The accepted practice for specifying bandwidth in a filter is to use the 3 dB cutoff frequency. Utilizing points such as the 6 dB or 9 dB cutoff frequencies results in signal degradation in an application. This can be illustrated in an application example. A typical application would include EMI filtering of data lines in a camera or display interface. In such an example it is important to first understand the signal and its spectral content. By understanding these things, an appropriate filter can be selected for the desired application. A typical data signal is pattern of 1’s and 0’s transmitted over a line in a form similar to a square wave. The maximum frequency of such a signal would be the pattern 1–0–1–0 such that for a signal with a data rate of 100 Mbps, the maximum frequency component would be 50 MHz. The next item to consider is the spectral content of the signal, which can be understood with the Fourier series

approximation of a square wave, shown below in Equations 1 and 2 in the Fourier series approximation.

From this it can be seen that a square wave consists of odd order harmonics and to fully construct a square wave n must go to infinity. However, to retain an acceptable portion of the waveform, the first two terms are generally sufficient. These two terms contain about 85% of the signal amplitude and allow a reasonable square wave to be reconstructed. Therefore, to reasonably pass a square wave of frequency x the minimum filter bandwidth necessary is 3x. All ON Semiconductor EMI filters are rated according to this principle. Attempting to violate this principle will result in significant rounding of the waveform and cause problems in transmitting the correct data. For example, take the filter with the response shown in Figure 8 and apply three different data waveforms. To calculate these three different frequencies, the 3 dB, 6 dB, and 9 dB bandwidths will be used.

Equation 1:

$$x(t) = \frac{1}{2} + \frac{2}{\pi} \sum_{n=1}^{\infty} \left[\frac{1}{2n-1} \sin((2n-1)\omega_0 t) \right] \quad (\text{eq. 1})$$

Equation 2 (simplified form of Equation 1):

$$x(t) = \frac{1}{2} + \frac{2}{\pi} \left[\frac{\sin(\omega_0 t)}{1} + \frac{\sin(3\omega_0 t)}{3} + \frac{\sin(5\omega_0 t)}{5} + \dots \right] \quad (\text{eq. 2})$$

Figure 8. Filter Bandwidth

From the above paragraphs it is shown that the maximum supported frequency of a waveform that can be passed through the filter can be found by dividing the bandwidth by a factor of three (to obtain the corresponding data rate

multiply the result by two). The following table gives the bandwidth values and the corresponding maximum supported frequencies and the third harmonic frequencies.

Table 2. Frequency Chart

Bandwidth	Maximum Supported Frequency	Third Harmonic Frequency
3 dB – 100 MHz	33.33 MHz (f_1)	100 MHz
6 dB – 200 MHz	66.67 MHz (f_2)	200 MHz
9 dB – 300 MHz	100 MHz (f_3)	300 MHz

Considering that 85% of the amplitude of the square is in the first two terms of the Fourier series approximation most of the signal content is at the fundamental (maximum supported) frequency and the third harmonic frequency. If a signal with a frequency of 33.33 MHz is input to this filter, the first two terms are sufficiently passed such that the signal is only mildly affected, as is shown in Figure 9a. If a signal

with a frequency of 66.67 MHz is input to this same filter, the third harmonic term is significantly attenuated. This serves to round the signal edges and skew the waveform, as is shown in Figure 9b. In the case that a 100 MHz signal is input to this filter, the third harmonic term is attenuated even further and results in even more rounding of the signal edges as is shown in Figure 9c. The result is the degradation of the data being transmitted making the digital data (1's and 0's) more difficult to discern. This does not include effects of other components such as interconnect and other path losses which could further serve to degrade the signal integrity. While some filter products may specify the 6 dB or 9 dB bandwidths, actually using these to calculate supported frequencies (and corresponding data rates) results in significant signal degradation. *To ensure the best signal integrity possible, it is best to use the 3 dB bandwidth to calculate the achievable data rate.*
