NCP5338

Integrated Driver and MOSFET

The NCP5338 integrates a MOSFET driver, high-side MOSFET and low-side MOSFET into a 6 mm x 6 mm 40-pin QFN package. The driver and MOSFETs have been optimized for high-current DC-DC buck power conversion applications. The NCP5338 integrated solution greatly reduces package parasitics and board space compared to a discrete component solution.

Features

- Optimized for High Frequency, High Conversion Ratio Operation
- Capable of Switching Frequencies Up to 1.5 MHz
- Internal Bootstrap Diode
- Zero Current Detection
- Undervoltage Lockout
- Internal Thermal Warning / Thermal Shutdown
- 40 A Continuous Output Current Capability
- These are Pb-Free Devices

NCP5338MNR2G	QFN40 (Pb-Free)	2500/Tape & Reel

†For information on tape and reel specifications, including part orientation and tape sizes, please refer to our Tape and Reel Packaging Specification Brochure, BRD8011/D.

Table 1. PIN FUNCTION DESCRIPTION

Pin No.	Pin Name	Description
1	ZCD_EN#	Enable Zero Current Detection
2	VCIN	Control Input Voltage
3	NC	No Connect
4	BOOT	Bootstrap Voltage
5, 37, FLAG 41	CGND	Control Signal Ground
6	GH	High Side FET Gate Access
7	PHASE	Provides a return path for the high side driver of the internal IC. Place a high frequency ceramic capacitor of 0.1 uF to 1.0 uF from this pin to BOOT pin.
8–14, FLAG 42	VIN	Input Voltage
15, 29–35, FLAG 43	VSWH	Switch Node Output
16–28	PGND	Power Ground
36	GL	Low Side FET Gate Access
38	THWN	Thermal Warning
39	DISB#	Output Disable Pin
40	PWM	PWM Drive Logic

Table 2. ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Min	Max
VCIN	Control Input Voltage	-0.3 V	6.5 V
VIN	Power Input Voltage (Note 1)	-0.3 V	28 V
BOOT	Bootstrap Voltage	-0.3 V wrt/VSWH	35 V wrt/PGND, 40 V < 50 ns wrt/PGND, 6.5 V wrt/VSWH
VSWH	Switch Node Output (Note 1)	-0.3 V	30 V
ZCD_EN#	Zero Current Detection	-0.3 V	6.5 V
PWM	PWM Drive Logic	-0.3 V	6.5 V
DISB#	Output Disable	-0.3 V	6.5 V
THWN	Thermal Warning	-0.3 V	6.5 V
Continuous Output Current, I _{OUT}	Output Current, F _{SW} = 300 kHz, V _{IN} = 12 V, V _{OUT} = 1.2 V (Note 2)	-	40 A
Continuous Output Current, I _{OUT}	Output Current, F _{SW} = 300 kHz, V _{IN} = 12 V, V _{OUT} = 1.2 V, LFM = 300 (Note 2)	-	50 A
Peak Output Current, I _{out-Pk} (Note 3)	Output Current, F _{SW} = 300 kHz, V _{IN} = 12 V, V _{OUT} = 1.2 V (Note 2)	-	80 A

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. During switching of the MOSFETs, high transient voltages can appear on these pins. It is important to keep these transients within the Maximum Ratings range.
2. I_{OUT} rating is based on using 3.0" x 3.0" PCB, 6 layer, 2 oz, T_A = 25°C, board design, natural convection, unless otherwise noted.
3. Peak Output Current is applied for t_p = 10 ms.

NOTE: This device is ESD sensitive. Use standard ESD precautions when handling.

Table 3. OPERATING RANGES

Rating	Symbol	Min	Typ	Max	Unit
Control Input Voltage	VCIN	4.5	5	5.5	V
Input Voltage	VIN	4.5	12	20	V

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

NCP5338

Table 4. THERMAL CHARACTERISTICS

Rating	Symbol	Value	Unit
Thermal Resistance, High-Side FET (Note 4)	$R_{\theta JPCB}$	11.7	°C/W
Thermal Resistance, Low-Side FET (Note 4)	$R_{\theta JPCB}$	2.8	°C/W
Operating Junction Temperature	T_J	-40 to 150	°C
Storage Temperature	T_S	-55 to 150	°C
Moisture Sensitivity Level	MSL	3	

4. When mounted on 1 in² of Cu., 1 oz. Thickness.

ELECTRICAL CHARACTERISTICS (Note 5) ($V_{CIN} = 5\text{ V}$, $V_{IN} = 12\text{ V}$, $T_A = -10^\circ\text{C}$ to $+100^\circ\text{C}$, unless otherwise noted)

Parameter	Symbol	Condition	Min	Typ	Max	Unit
-----------	--------	-----------	-----	-----	-----	------

SUPPLY CURRENT

VCIN Current (normal mode)	-	DISB# = 5 V, PWM = OSC, FSW = 400 kHz		20	35	mA
VCIN Current (shutdown mode)	-	DISB# = GND		15	30	μA

UNDERVOLTAGE LOCKOUT

UVLO Startup	-		3.8	4.35	4.5	V
UVLO Hysteresis	-		150	200	250	mV

BOOTSTRAP DIODE

Forward Voltage	-	$V_{CIN} = 5\text{ V}$, forward bias current = 2 mA	0.1	0.4	0.6	V
-----------------	---	--	-----	-----	-----	---

PWM INPUT

PWM Input Voltage High	V_{PWM_HI}		3.7			V
PWM Input Voltage Mid-State	V_{PWM_MID}		1.3		3.0	V
PWM Input Voltage Low	V_{PWM_LO}				0.7	V
Tri-State Shutdown Holdoff Time	$t_{holdoff}$			250		ns
PWM Input Resistance				63		kΩ
PWM Input Bias Voltage				2.2		V

OUTPUT DISABLE

Output Disable Input Voltage High	$V_{DISB\#_HI}$		2.0			V
Output Disable Input Voltage Low	$V_{DISB\#_LO}$				0.8	V
Output Disable Hysteresis	-			500		mV
Output Disable Propagation Delay				20	40	ns

ZERO CROSS DETECT

Zero Cross Detect High	$V_{ZCD_EN\#_HI}$		2.0			V
Zero Cross Detect Low	$V_{ZCD_EN\#_LO}$				0.8	V
Zero Cross Detect Threshold (Note 6)				-6		mV
ZCD Blanking Timer				250		ns

THERMAL WARNING/SHUTDOWN

Thermal Warning Temperature				150		°C
Thermal Warning Hysteresis				15		°C
Thermal Shutdown Temperature				180		°C
Thermal Shutdown Hysteresis				25		°C

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

- Performance guaranteed over the indicated operating temperature range by design and/or characterization tested at $T_J = T_A = 25^\circ\text{C}$. Low duty cycle pulse techniques are used during testing to maintain the junction temperature as close to ambient as possible.
- Guaranteed by design. Not production tested.

APPLICATIONS INFORMATION

Theory of Operation

The NCP5338 is an integrated driver and MOSFET module designed for use in a synchronous buck converter topology. A single PWM input signal is all that is required to properly drive the high-side and low-side MOSFETs.

Low-Side Driver

The low-side driver is designed to drive a ground-referenced low $R_{DS(on)}$ N-Channel MOSFET. The voltage rail for the low-side driver is internally connected to VCIN and PGND.

High-Side Driver

The high-side driver is designed to drive a floating low $R_{DS(on)}$ N-channel MOSFET. The gate voltage for the high side driver is developed by a bootstrap circuit referenced to Switch Node (VSWH) pin.

The bootstrap circuit is comprised of the internal diode and an external bootstrap capacitor. When the NCP5338 is starting up, the VSWH pin is at ground, so the bootstrap capacitor will charge up to VCIN through the bootstrap diode. See Figure 1. When the PWM input goes high, the high-side driver will begin to turn on the high-side MOSFET using the stored charge of the bootstrap capacitor. As the high-side MOSFET turns on, the VSWH pin will rise. When the high-side MOSFET is fully on, the switch node will be at 12 V, and the BST pin will be at 5 V plus the charge of the bootstrap capacitor (approaching 17 V).

The bootstrap capacitor is recharged when the switch node goes low during the next cycle.

Zero Current Detect

When ZCD_EN# is set high, the NCP5338 will operate in normal PWM mode.

When ZCD_EN# is set low, zero current detect (ZCD) will be enabled. If PWM goes high, GH will go high after the non-overlap delay. If PWM goes low, GL will go high after the non-overlap delay, and stay high for the duration of the ZCD blanking timer. Once this timer has expired, VSWH will be monitored for zero current detection, and will pull GL low once detected. The threshold on VSWH to determine zero current undergoes an auto-calibration cycle every time DISB# is brought from low to high. This auto-calibration cycle typically takes 28 μ s to complete.

Safety Timer and Overlap Protection Circuit

It is very important that MOSFETs in a synchronous buck regulator do not both conduct at the same time. Excessive shoot-through or cross conduction can damage the MOSFETs, and even a small amount of cross conduction will cause a decrease in the power conversion efficiency.

The NCP5338 prevents cross conduction by monitoring the status of the MOSFETs and applying the appropriate amount of “dead-time” or the time between the turn off of one MOSFET and the turn on of the other MOSFET.

When the PWM input pin goes high, the gate of the low-side MOSFET (GL pin) will go low after a propagation delay (tpdLGL). The time it takes for the low-side MOSFET to turn off (tfGL) is dependent on the total charge on the low-side MOSFET gate. The NCP5338 monitors the gate voltage of both MOSFETs and the switchnode voltage to determine the conduction status of the MOSFETs. Once the low-side MOSFET is turned off an internal timer will delay (tpdhGH) the turn on of the high-side MOSFET.

Likewise, when the PWM input pin goes low, the gate of the high-side MOSFET (GH pin) will go low after the propagation delay (tpdIGH). The time to turn off the high-side MOSFET (tfGH) is dependent on the total gate charge of the high-side MOSFET. A timer will be triggered once the high-side MOSFET has stopped conducting, to delay (tpdhGL) the turn on of the low-side MOSFET.

Thermal Warning / Thermal Shutdown

When the temperature of the driver reaches 150°C, the THWN pin will be pulled low indicating a thermal warning. At this point, the part continues to function normally. When the temperature drops below 135°C, the THWN will go high.

If the driver temperature exceeds 180°C, the part will enter thermal shutdown and turn off both MOSFETs. Once the temperature falls below 155°C, the part will resume normal operation. The THWN pin has a maximum current capability of 30 mA.

Power Supply Decoupling

The NCP5338 can source and sink relatively large current to the gate pins of the MOSFETs. In order to maintain a constant and stable supply voltage (VCIN) a low ESR capacitor should be placed near the power and ground pins. A 1 μ F to 4.7 μ F multi layer ceramic capacitor (MLCC) is usually sufficient.

Bootstrap Circuit

The bootstrap circuit uses a charge storage capacitor (C_{BST}) and the internal diode. The bootstrap capacitor must have a voltage rating that is able to withstand twice the maximum supply voltage. A minimum 50 V rating is recommended. A bootstrap capacitance greater than 100 nF and a minimum 50 V rating is recommended. A good quality ceramic capacitor should be used.
