DYNAMIC RANDOM-ACCESS MEMORIES
 SMHS166C - AUGUST 1992 - REVISED JUNE 1995

This data sheet is applicable to all TMS44165/Ps symbolized with Revision "D" and subsequent revisions as described on page 4-92.

- Organization . . . 262 144 × 16
- 5-V Supply (±10% Tolerance)
- Performance Ranges:

	ACCESS TIME	ACCESS TIME	ACCESS TIME	READ OR WRITE CYCLE
	t _{TRAC} MAX	t _{CAC} MAX	t _{AA} MAX	MIN
'44165/P-60	60 ns	15 ns	30 ns	110 ns
'44165/P-70	70 ns	20 ns	35 ns	130 ns
'44165/P-80	80 ns	20 ns	40 ns	150 ns

- **Enhanced-Page-Mode Operation With CAS-Before-RAS (CBR) Refresh**
- Long Refresh Period
 - 1024-Cycle Refresh in 16 ms (Max)
 - 128 ms Max for Low-Power With Self-Refresh Version (TMS44165P)
- 3-State Unlatched Output
- Low Power Dissipation
- Texas Instruments EPIC™ CMOS Process
- All Inputs, Outputs, and Clocks Are TTL Compatible
- High-Reliability, 40-Lead, 400-Mil-Wide Plastic Surface-Mount (SOJ) Package and 40/44-Lead Thin Small-Outline Package (TSOP)
- Operating Free-Air Temperature Range 0°C to 70°C
- Low-Power With Self-Refresh Version
- Upper and Lower Byte Control During Write Operations

description

The TMS44165 series are high-speed, 4 194 304-bit dynamic random-access memories organized as 262 144 words of 16 bits each. The TMS44165P series are high-speed, low-power, self-refresh 4 194 304-bit dynamic random-access memories organized as 262 144 words of 16 bits each. They employ state-of-the-art EPIC™ (Enhanced Performance Implanted CMOS) technology for high performance, reliability, and low power.

These devices feature maximum RAS access times of 60 ns, 70 ns, and 80 ns. Maximum power dissipation is as low as 580 mW operating and 11 mW standby on 80-ns devices. All inputs and outputs, including clocks, are compatible with Series 74 TTL. All addresses and data-in lines are latched on chip to simplify system design. Data out is unlatched to allow greater system flexibility.

The TMS44165 and TMS44165P are each offered in a 40-lead plastic surface-mount SOJ package (DZ suffix) and a 40/44-lead plastic surface-mount TSOP package (DGE suffix). These packages are characterized for operation from 0°C to 70°C.

EPIC is a trademark of Texas Instruments Incorporated.

PRODUCTION DATA Information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

DYNAMIC RANDOM-ACCESS MEMORIES

SMHS186C - AUGUST 1992 - REVISED JUNE 1995

operation

enhanced page mode

Page-mode operation allows faster memory access by keeping the same row address while selecting random column addresses. The time for row-address setup and hold and address multiplex is eliminated. The maximum number of columns that can be accessed is determined by the maximum \overline{RAS} low time and the \overline{CAS} page-mode cycle time used. With minimum \overline{CAS} page cycle time, all 256 columns specified by column addresses A0-A7 can be accessed without intervening \overline{RAS} cycles.

Unlike conventional page-mode DRAMs, the column-address buffers in this device are activated on the falling edge of \overline{RAS} . The buffers act as transparent or flow-through latches while \overline{CAS} is high. The first falling edge of \overline{CAS} latches the column addresses. This feature allows the devices to operate at a higher data bandwidth than conventional page-mode parts because data retrieval begins as soon as column address is valid rather than when \overline{CAS} transitions low. This performance improvement is referred to as enhanced page mode. A valid column address can be presented immediately after t_{RAH} (row-address hold time) has been satisfied, usually well in advance of the falling edge of \overline{CAS} . In this case, data is obtained after $t_{CAC\ max}$ (access time from \overline{CAS} low) if $t_{AA\ max}$ (access time from column address) has been satisfied. In the event that column addresses for the next page cycle are valid at the time \overline{CAS} goes high, minimum access time for the next cycle is determined by t_{CPA} (access time from rising edge of the last \overline{CAS}).

address (A0-A9)

Eighteen address bits are required to decode 1 of 262144 storage cell locations. Ten row-address bits are set up on A0-A9 and latched onto the chip by \overline{RAS} . Then, eight column-address bits are set up on A0 through A7 and latched onto the chip by \overline{CAS} . All addresses must be stable on or before the falling edge of \overline{RAS} and \overline{CAS} . \overline{RAS} is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. \overline{CAS} is used as a chip select activating the output buffers and latching the address bits into the column-address buffers.

write enable (\overline{UW} , \overline{LW})

The read or write mode is selected through the upper or lower write-enable (\overline{UW} , \overline{LW}) input. \overline{LW} controls DQ0-DQ7, and \overline{UW} controls DQ8-DQ15. A logic high on the \overline{UW} and \overline{LW} input selects the read mode and a logic low selects the write mode. The write-enable terminal can be driven from the standard TTL circuits without a pullup resistor. The data input is disabled when the read mode is selected. When \overline{UW} or \overline{LW} goes low prior to \overline{CAS} (early write), data out remains in the high-impedance state for the entire cycle permitting a write operation with \overline{OE} grounded.

Either \overline{UW} or \overline{LW} can be brought low, and the user can write into eight DQ locations; \overline{UW} and \overline{LW} can be brought low at the same time and all 16 DQ are written into.

data in (DQ0-DQ15)

Data is written during a write or read-modify-write cycle. Depending on the mode of operation, the falling edge of \overline{CAS} , \overline{UW} , or \overline{LW} strobes data into the on-chip data latch. In an early-write cycle, \overline{UW} or \overline{LW} is brought low prior to \overline{CAS} , and the data is strobed in by \overline{CAS} with setup and hold times referenced to this signal. In a delayed-write or read-modify-write cycle, \overline{CAS} is already low, and data is strobed in by \overline{UW} or \overline{LW} with setup and hold times referenced to this signal. In a delayed-write or read-modify-write cycle, \overline{OE} must be high to bring the output buffers to the high-impedance state prior to impressing data on the I/O lines. The \overline{LW} terminal controls DQ0-DQ7. The \overline{UW} pin controls DQ8-DQ15.

data out (DQ0-DQ15)

The 3-state output buffer provides direct TTL compatibility (no pullup resistor required) with a fanout of two Series 74 TTL loads. Data out is the same polarity as data in. The output is in the high-impedance (floating) state until \overline{CAS} and \overline{OE} are brought low. In a read cycle, the output becomes valid after the access time interval t_{CAC} (which begins with the negative transition of \overline{CAS}) as long as t_{RAC} and t_{AA} are satisfied.

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77251-1443

output enable (\overline{OE})

\overline{OE} controls the impedance of the output buffers. When \overline{OE} is high, the buffers remain in the high-impedance state. Bringing \overline{OE} low during a normal cycle activates the output buffers, putting them in the low-impedance state. It is necessary for both \overline{RAS} and \overline{CAS} to be brought low for the output buffers to go into the low-impedance state. Once in the low-impedance state, they remain in the low-impedance state until either \overline{OE} or \overline{CAS} is brought high.

\overline{RAS} -only refresh

A refresh operation must be performed at least once every 16 ms (128 ms for TMS44165P) to retain data. This can be achieved by strobing each of the 1024 rows (A0-A9). A normal read or write cycle refreshes all bits in each row that is selected. A \overline{RAS} -only operation can be used by holding \overline{CAS} at the high (inactive) level, conserving power as the output buffers remain in the high-impedance state. Externally generated addresses must be used for a \overline{RAS} -only refresh.

hidden refresh

Hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding \overline{CAS} at V_{IL} after a read operation and cycling \overline{RAS} after a specified precharge period, similar to a \overline{RAS} -only refresh cycle. The external address is ignored, and the refresh address is generated internally.

\overline{CAS} -before- \overline{RAS} (CBR) refresh

CBR refresh is utilized by bringing \overline{CAS} low earlier than \overline{RAS} (see parameter t_{CSP}) and holding it low after \overline{RAS} falls (see parameter t_{CHR}). For successive CBR refresh cycles, \overline{CAS} remains low while cycling \overline{RAS} . The external address is ignored and the refresh address is generated internally.

A low-power battery-backup refresh mode that requires less than 500 μA refresh current is available on the TMS44165P. Data integrity is maintained using CBR refresh with a period of 125 μs while holding \overline{RAS} low for less than 1 μs . To minimize current consumption, all input levels must be at CMOS levels ($V_{IL} \leq 0.2 V$, $V_{IH} \geq V_{CC} - 0.2 V$).

self refresh (TMS44165P)

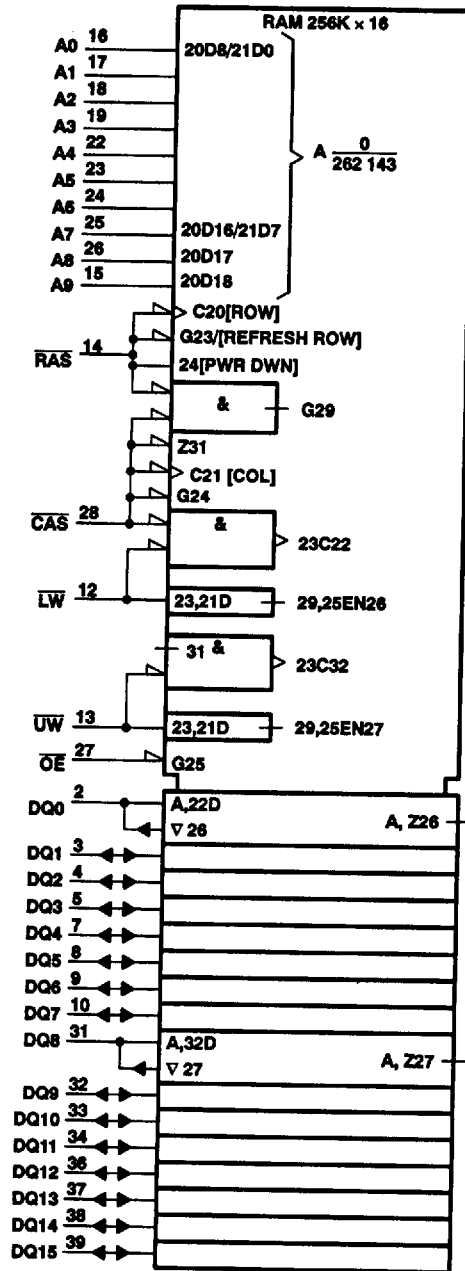

The self-refresh mode is entered by dropping \overline{CAS} low prior to \overline{RAS} going low. Then \overline{CAS} and \overline{RAS} are both held low for a minimum of 100 μs . The chip is then refreshed internally by an on-board oscillator. No external address is required because the CBR counter is used to keep track of the address. To exit the self-refresh mode, both \overline{RAS} and \overline{CAS} are brought high to satisfy t_{CHS} . Upon exiting the self-refresh mode, a burst refresh (refresh a full set of row addresses) must be executed before continuing with normal operation. This ensures the DRAM is fully refreshed.

power up

To achieve proper device operation, an initial pause of 200 μs followed by a minimum of eight \overline{RAS} cycles is required after power up to the full V_{CC} level. These eight initialization cycles must include at least one refresh (\overline{RAS} -only or CBR) cycle.

functional block diagram

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC}	- 1 V to 7 V
Input voltage range (see Note 1)	- 1 V to 7 V
Short-circuit output current	50 mA
Power dissipation	1 W
Operating free-air temperature range, T_A	0°C to 70°C
Storage temperature range, T_{stg}	- 55°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to V_{SS} .

recommended operating conditions

	MIN	NOM	MAX	UNIT
V_{CC} Supply voltage	4.5	5	5.5	V
V_{SS} Supply voltage		0		V
V_{IH} High-level input voltage	2.4		6.5	V
V_{IL} Low-level input voltage (see Note 2)	- 1		0.8	V
T_A Operating free-air temperature	0		70	°C

NOTE 2: The algebraic convention, where the more negative (less positive) limit is designated as minimum, is used for logic-voltage levels only.

11. Early-write operation only
12. CBR refresh only
13. The minimum value is measured when t_{RCD} is set to t_{RCD} min as a reference.
14. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.
15. Read-modify-write operation only
16. Maximum value specified only to assure access time

POST OFFICE BOX 1443 • HOUSTON, TEXAS 77261-1443

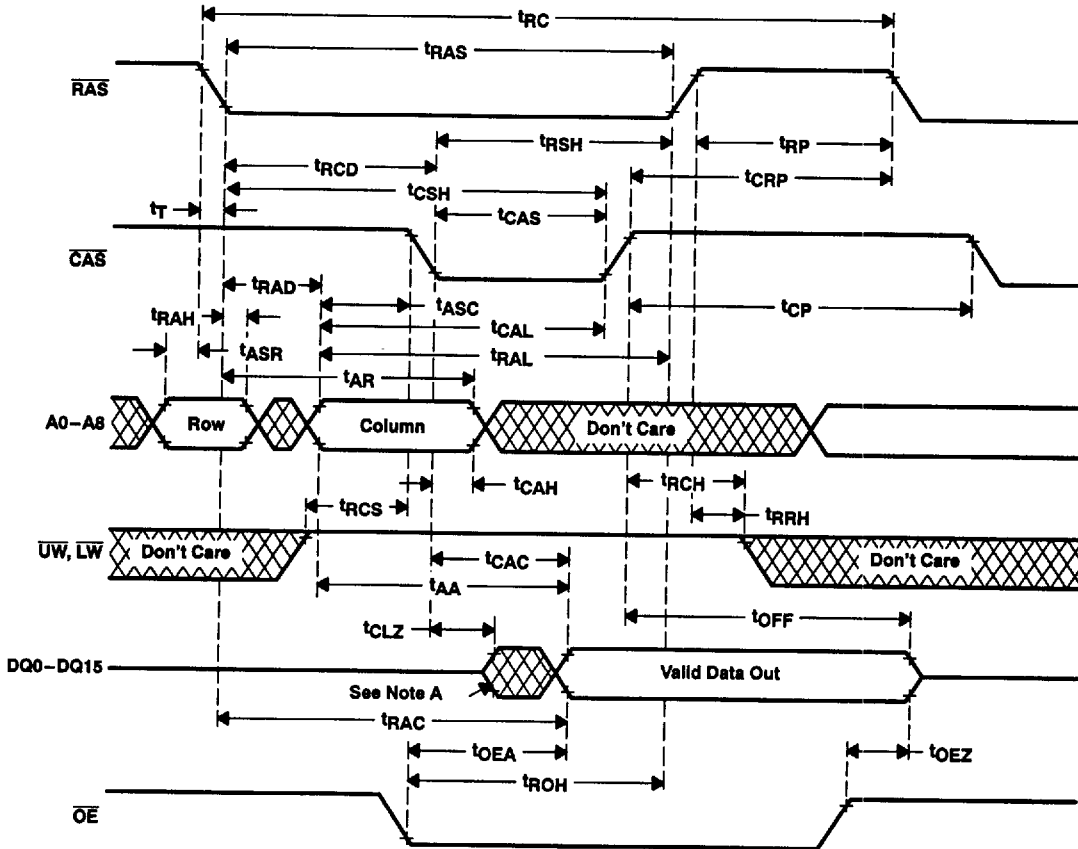

PARAMETER MEASUREMENT INFORMATION

NOTE A: C_L includes probe and fixture capacitance.

Figure 1. Load Circuits for Timing Parameters

PARAMETER MEASUREMENT INFORMATION

NOTE B: Output can go from the high-impedance state to an invalid data state prior to the specified access time.

Figure 2. Read-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

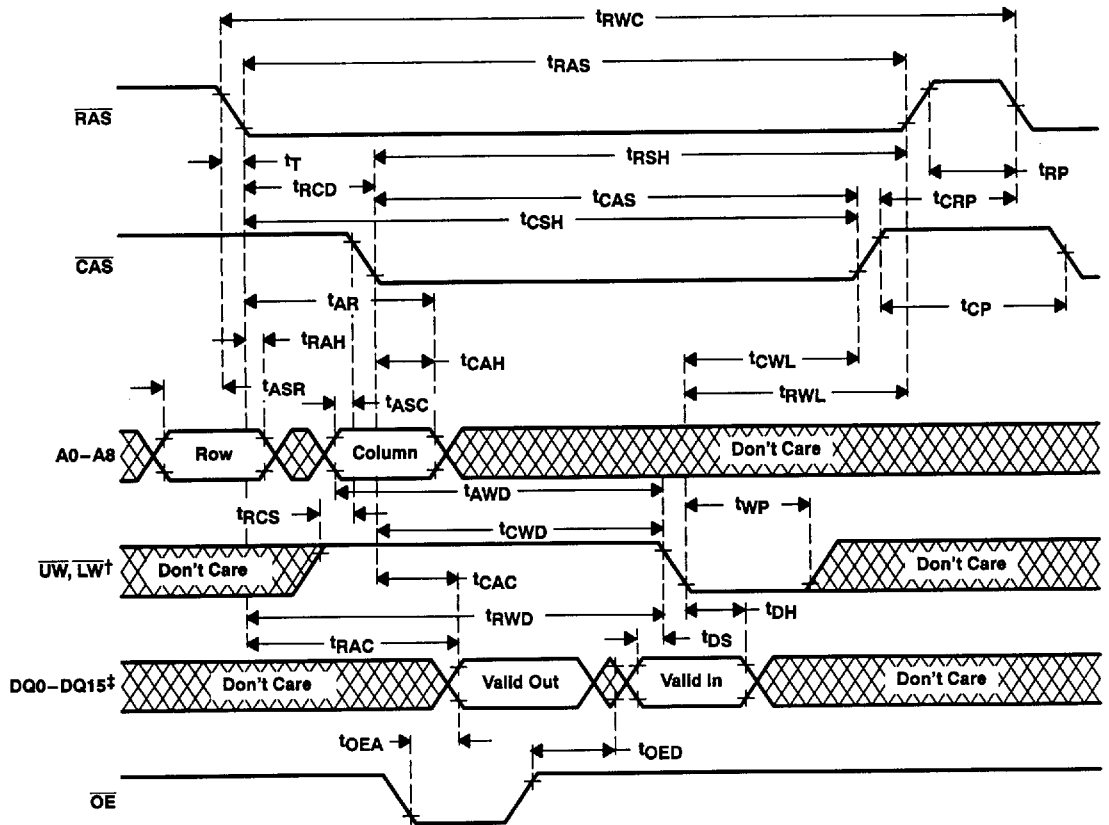

† Either \overline{UW} or \overline{LW} can be brought low, and the user can write into eight DQ locations; \overline{UW} and \overline{LW} can be brought low at the same time and all 16 DQ locations are written into.

‡ All DQ pins remain in the high-impedance state for an early write cycle.

NOTE A: Later of \overline{CAS} or \overline{xW} in write operations.

Figure 4. Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

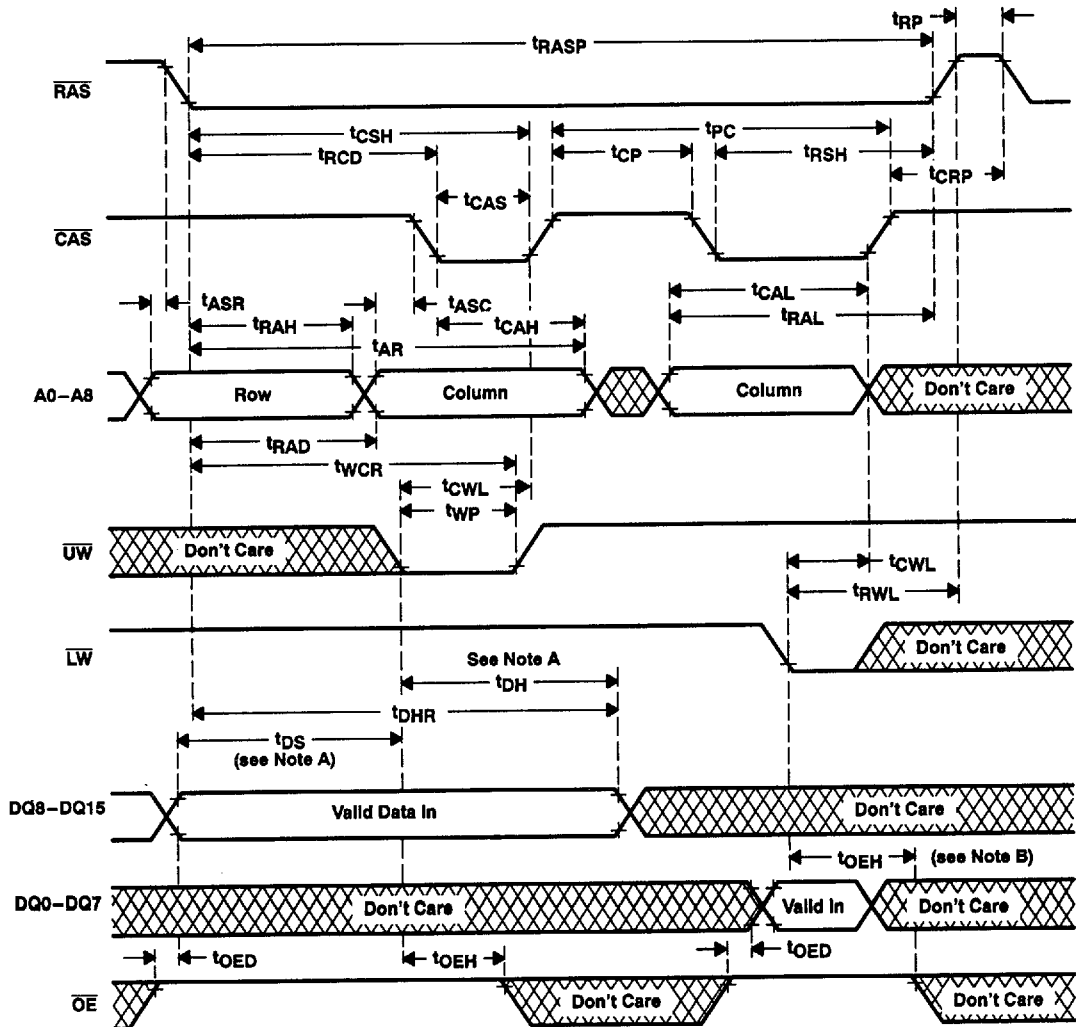

† Either \overline{UW} or \overline{LW} can be brought low, and the user can write into eight DQ locations; \overline{UW} and \overline{LW} can be brought low at the same time and all 16 DQ locations are written into.

‡ All DQ pins remain in the high-impedance state for an early write cycle.

Figure 5. Read-Modify-Write-Cycle Timing

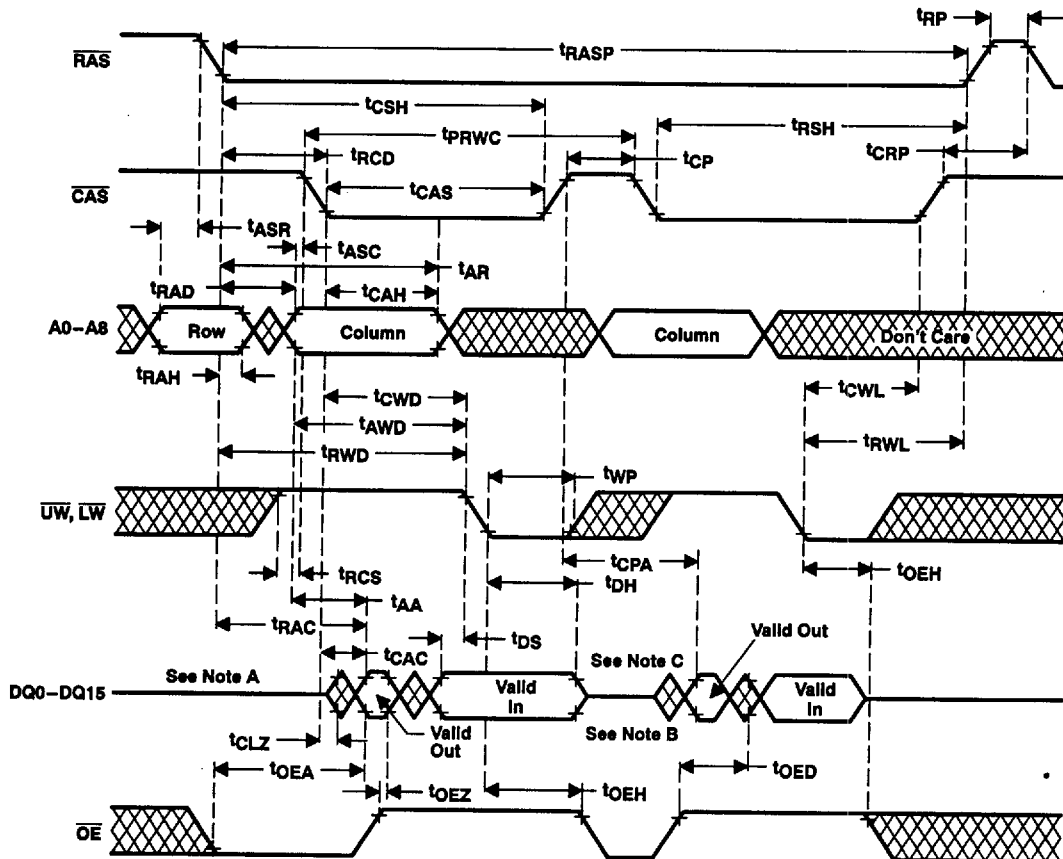

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. Later of \overline{CAS} or \overline{xW} in write operations.
 B. A read cycle or read-modify-write cycle can be mixed with the write cycles as long as the read and read-modify-write timing specifications are not violated.

Figure 7. Enhanced-Page-Mode Write-Cycle Timing

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. Output can go from the high-impedance state to an invalid data state prior to the specified access time.
 B. Access time is t_{CPA} or t_{AA} dependent.
 C. A read or write cycle can be intermixed with read-modify-write cycles as long as the read and write cycle timing specifications are not violated.
