43.2.3 SRCn_BUSIF_DALIGN Register (SRCn_BUSIF_DALIGN)

Note: n = 2, 5, 6, 7, 8, or 9 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]
 n = 0, 2, 4, 5, 6, 7, 8, or 9 [RZ/G2E]

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCn_BUSIF_DALIGN determines the initial settings of the SRCn route.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|--------|----|----|----|--------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| | | | | | | | | | | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | place1 | — | — | — | place0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | place1 | B'1 | R/W | Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 1 on the output side. 0: Data at input-side place 0 is sent to output-side place 1. 1: Data at input-side place 1 is sent to output-side place 1. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | place0 | B'0 | R/W | Changes the stream data order. The data order is changed before input to the SRC. Selects the input-side data to be output to place 0 on the output side. 0: Data at input-side place 0 is sent to output-side place 0. 1: Data at input-side place 1 is sent to output-side place 0. |

43.2.4 SRCm_MODE Register (SRCm_MODE)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_MODE determines the initial settings of the SRCm route.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----------|---------|----|----|----|----|----|----|----|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | sync_out | sync_in | — | — | — | — | — | — | — | uf_data |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | src |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 26 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 25 | sync_out | B'0 | R/W | srcmout_sync Selects how to treat data in the SRC output buffer. 0: Asynchronous SRC 1: Synchronous SRC |
| 24 | sync_in | B'0 | R/W | srcmin_sync Selects how to treat data in the SRC input buffer. 0: Asynchronous SRC 1: Synchronous SRC |
| 23 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | uf_data | B'0 | R/W | srcm_uf_data_sel Selects how to treat data when an underflow occurs in the SRC input buffer. 0: Data before the underflow occurs is output. 1: All 0s are output. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | src | B'0 | R/W | srcm_src Selects whether to use SRCm. 0: SRCm is not used. 1: SRCm is used. |

- Notes:
1. Set one of sync_in and sync_out bits, when SRCm is used in synchronous mode by setting SRCMD bit in SRCm_SRCCR register.
 2. If sync_out is set in synchronous mode, data should directly transmit to memory. (Data should not transmit throughout CMD.)

43.2.5 SRCm Control Register (SRCm_CONTROL)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_CONTROL starts or stops transfer.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | start_out | — | — | — | start_in |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | start_out | B'0 | R/W | SRCmout_start_flag Starts or stops transfer via SRCm. 0: Stops transfer. 1: Starts transfer. |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | start_in | B'0 | R/W | SRCmin_start_flag Starts or stops transfer via SRCm. 0: Stops transfer. 1: Starts transfer. |

Note: When CMD is used with route SRC0, SRC1, SRC2, SRC3, SRC4, SRC5, SRC6 or SRC9 SRCmout_start_flag should be set to 0 to stop transfer. When CMD is not used with route SRC0, SRC1, SRC2, SRC3, SRC4, SRC5, SRC6 or SRC9, or when route SRC7 or SRC8 is used, SRCmin_start_flag and SRCmout_start_flag should be set simultaneously.

43.2.6 SRCm Status Register (SRCm_STATUS)

Note: m = 0 to 6, 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRCm interrupt enable register, interrupt signals are not output.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|---------|---------|----|----|---------|---------|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | dvc1 | — | — | — | dvc0 | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | uf_src0 | of_src0 | — | — | of_src1 | uf_src1 | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 29 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 28 | dvc1 | B'0 | R | dvc1 Indicates the state of the DVC1_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC1_DVIER. |
| 27 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | dvc0 | B'0 | R | dvc0 Indicates the state of the DVC0_DVUSR register collectively. The state information is used only for the interrupt signal that is enabled by DVC0_DVIER. |
| 23 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 | uf_src0 | B'0 | R | under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1. |
| 12 | of_src0 | B'0 | R | over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0. |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 9 | of_srcin | B'0 | R | over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1. |
| 8 | uf_srcin | B'0 | R | under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0. |
| 7 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

43.2.7 SRCn Status Register (SRCn_STATUS)

Note: n = 7 and 8

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCn_STATUS indicates the state of each SRC. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SRCn interrupt enable register, interrupt signals are not output.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|---------|---------|----|----|---------|---------|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | uf_srco | of_srco | — | — | of_src1 | uf_src1 | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 14 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 13 | uf_srco | B'0 | R | under_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1. |
| 12 | of_srco | B'0 | R | over_flow_srcout Indicates the state of the output buffer of SRCout in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0. |
| 11, 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 | of_src1 | B'0 | R | over_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS1 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE1. |
| 8 | uf_src1 | B'0 | R | under_flow_srcin Indicates the state of the output buffer of SRCin in the SCU_SYSTEM_STATUS0 register. The state information is used when the interrupt signal is enabled by SCU_SYSTEM_INT_ENABLE0. |
| 7 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

43.2.8 SRCm Interrupt Enable Register 0 (SRCm_INT_ENABLE0)

Note: m = 0 to 6, 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_INT_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SRCm status register.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 28 | place7 | H'7 | R/W | Changes the stream data order. These bits are used for the 8-channel setting. For the 6- or less-channel setting, the initial value should not be changed. The data order is changed after output from the CMD. Selects the input-side data to be output to place 7 on the output side. B'000: Data at input-side place0 is sent to output-side place7. B'001: Data at input-side place1 is sent to output-side place7. B'010: Data at input-side place2 is sent to output-side place7. B'011: Data at input-side place3 is sent to output-side place7. B'100: Data at input-side place4 is sent to output-side place7. B'101: Data at input-side place5 is sent to output-side place7. B'110: Data at input-side place6 is sent to output-side place7. B'111: Data at input-side place7 is sent to output-side place7. |
| 27 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 26 to 24 | place6 | H'6 | R/W | Changes the stream data order. These bits are used for the 8-channel setting. For the 6- or less-channel setting, the initial value should not be changed. The data order is changed after output from the CMD. Selects the input-side data to be output to place 6 on the output side. B'000: Data at input-side place0 is sent to output-side place6. B'001: Data at input-side place1 is sent to output-side place6. B'010: Data at input-side place2 is sent to output-side place6. B'011: Data at input-side place3 is sent to output-side place6. B'100: Data at input-side place4 is sent to output-side place6. B'101: Data at input-side place5 is sent to output-side place6. B'110: Data at input-side place6 is sent to output-side place6. B'111: Data at input-side place7 is sent to output-side place6. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 23 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 22 to 20 | place5 | H'5 | R/W | Changes the stream data order. These bits are used for the 6- or more-channel setting. For the 4- or less-channel setting, the initial value should not be changed. The data order is changed after output from the CMD. Selects the input-side data to be output to place 5 on the output side. B'000: Data at input-side place0 is sent to output-side place5. B'001: Data at input-side place1 is sent to output-side place5. B'010: Data at input-side place2 is sent to output-side place5. B'011: Data at input-side place3 is sent to output-side place5. B'100: Data at input-side place4 is sent to output-side place5. B'101: Data at input-side place5 is sent to output-side place5. B'110: Data at input-side place6 is sent to output-side place5. B'111: Data at input-side place7 is sent to output-side place5. |
| 19 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 18 to 16 | place4 | H'4 | R/W | Changes the stream data order. These bits are used for the 6- or more-channel setting. For the 4- or less-channel setting, the initial value should not be changed. The data order is changed after output from the CMD. Selects the input-side data to be output to place 4 on the output side. B'000: Data at input-side place0 is sent to output-side place4. B'001: Data at input-side place1 is sent to output-side place4. B'010: Data at input-side place2 is sent to output-side place4. B'011: Data at input-side place3 is sent to output-side place4. B'100: Data at input-side place4 is sent to output-side place4. B'101: Data at input-side place5 is sent to output-side place4. B'110: Data at input-side place6 is sent to output-side place4. B'111: Data at input-side place7 is sent to output-side place4. |
| 15 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 14 to 12 | place3 | H'3 | R/W | Changes the stream data order. These bits are used for the 4- or more-channel setting. For the 2- or less-channel setting, the initial value should not be changed. The data order is changed after output from the CMD. Selects the input-side data to be output to place 3 on the output side. B'000: Data at input-side place0 is sent to output-side place3. B'001: Data at input-side place1 is sent to output-side place3. B'010: Data at input-side place2 is sent to output-side place3. B'011: Data at input-side place3 is sent to output-side place3. B'100: Data at input-side place4 is sent to output-side place3. B'101: Data at input-side place5 is sent to output-side place3. B'110: Data at input-side place6 is sent to output-side place3. B'111: Data at input-side place7 is sent to output-side place3. |
| 11 | — | 0 | R | Reserved This bit is always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |

43.2.13 CMDn Control Register (CMDn_CONTROL)

Note: n = 0, 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CMDn_CONTROL starts or stops transfer.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|-----------|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | start_out | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | start_out | B'0 | R/W | CMDnout_start_flag Starts or stops transfer via CMDn. 0: Stops transfer. 1: Starts transfer. |
| 3 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

43.2.14 SCU_SYSTEM Status Register 0 (SCU_SYSTEM_STATUS0)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SCU_SYSTEM_STATUS0 indicates the internal buffer state. When a register bit is set, the corresponding interrupt signal is output. However, if interrupt outputs are masked by the SYSTEM interrupt enable register 0, interrupt signals are not output.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----------|----------|----|----|----------|----------|----------|----------|----------|----------|----------|----------|----------|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | of_cmd1o | of_cmd0o | — | — | of_src9o | of_src8o | of_src7o | of_src6o | of_src5o | of_src4o | of_src3o | of_src2o | of_src1o | of_src0o |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 | R/WC1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-------|---|
| 31, 30 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 29 | of_cmd1o | B'0 | R/WC1 | over_flow_cmd1out Indicates the state of the CMD1out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 28 | of_cmd0o | B'0 | R/WC1 | over_flow_cmd0out Indicates the state of the CMD0out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 27, 26 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 25 | of_src9o | B'0 | R/WC1 | over_flow_src9out Indicates the state of the SRC9out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 24 | of_src8o | B'0 | R/WC1 | over_flow_src8out Indicates the state of the SRC8out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 23 | of_src7o | B'0 | R/WC1 | over_flow_src7out Indicates the state of the SRC7out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 22 | of_src6o | B'0 | R/WC1 | over_flow_src6out Indicates the state of the SRC6out output buffer. 0: Normal operation 1: An overflow has occurred. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-------|---|
| 21 | of_src5o | B'0 | R/WC1 | over_flow_src5out Indicates the state of the SRC5out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 20 | of_src4o | B'0 | R/WC1 | over_flow_src4out Indicates the state of the SRC4out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 19 | of_src3o | B'0 | R/WC1 | over_flow_src3out Indicates the state of the SRC3out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 18 | of_src2o | B'0 | R/WC1 | over_flow_src2out Indicates the state of the SRC2out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 17 | of_src1o | B'0 | R/WC1 | over_flow_src1out Indicates the state of the SRC1out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 16 | of_src0o | B'0 | R/WC1 | over_flow_src0out Indicates the state of the SRC0out output buffer. 0: Normal operation 1: An overflow has occurred. |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 | uf_src9i | B'0 | R/WC1 | under_flow_src9in Indicates the state of the SRC9in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 8 | uf_src8i | B'0 | R/WC1 | under_flow_src8in Indicates the state of the SRC8in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 7 | uf_src7i | B'0 | R/WC1 | under_flow_src7in Indicates the state of the SRC7in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 6 | uf_src6i | B'0 | R/WC1 | under_flow_src6in Indicates the state of the SRC6in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 5 | uf_src5i | B'0 | R/WC1 | under_flow_src5in Indicates the state of the SRC5in input buffer. 0: Normal operation 1: An underflow has occurred. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-------|--|
| 4 | uf_src4i | B'0 | R/WC1 | under_flow_src4in Indicates the state of the SRC4in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 3 | uf_src3i | B'0 | R/WC1 | under_flow_src3in Indicates the state of the SRC3in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 2 | uf_src2i | B'0 | R/WC1 | under_flow_src2in Indicates the state of the SRC2in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 1 | uf_src1i | B'0 | R/WC1 | under_flow_src1in Indicates the state of the SRC1in input buffer. 0: Normal operation 1: An underflow has occurred. |
| 0 | uf_src0i | B'0 | R/WC1 | under_flow_src0in Indicates the state of the SRC0in input buffer. 0: Normal operation 1: An underflow has occurred. |

43.2.15 SCU_SYSTEM Interrupt Enable Register 0 (SCU_SYSTEM_INT_ENABLE0)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SCU_SYSTEM_INT_ENABLE0 enables or disables output of interrupts corresponding to the states indicated in the SCU_SYSTEM status register 0.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 to 16 | OTBL[4:0] | H'00 | R/W | Bit Length of Output Audio Data. These bits set the bit length of output audio data. B'0_0000: 24 bits B'0_0001: Reserved B'0_0010: 22 bits B'0_0011: Reserved B'0_0100: 20 bits B'0_0101: Reserved B'0_0110: 18 bits B'0_0111: Reserved B'0_1000: 16 bits B'0_1001 to B'0_1111: Reserved B'1_0000: 8 bits B'1_0001 to B'1_1111: Reversed |
| 15 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|------------|---------------|-----|--|
| 3 to 0 | CHNUM[3:0] | H'0 | R/W | <p>Channel Number</p> <p>These bits set the input data channel number.</p> <p>m = 0, 1, 3, or 4 [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] m = 1 and 3 [RZ/G2E]</p> <p>B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved</p> <p>m = 2, 5 to 9 [, RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] m = 0, 2, 4, 5 or 9 [RZ/G2E]</p> <p>B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011 to B'1111: Reserved</p> |

43.2.21 SRCm IFS Control Register (SRCm_IFSCR)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_IFSCR is a 32-bit readable/writable register that controls INTIFS value.

| | | | | | | | | | | | | | | | | | | |
|----------------|-------------|----|----|----|----|----|----|----|-----------------------|-----|-----|-----|-----|-----|-----|-----------|--|--|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| | fast_ijk_en | — | — | — | — | — | — | — | fast_ijk_setting[7:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | INTIFS EN | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------------|---------------|-----|--|
| 31 | fast_ijk_en | B'0 | R/W | fast_ijk Enable It can diminish convergence time to input frequency deflection. 0: Reserved 1: It can be gradual decrease of convergence time. This function is valid if SRCm_SRCCR Register SRCMD = 0 (Asynchronous SRC). |
| 30 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 20 | fast_ijk_setting[7:4] | H'0 | R/W | The period that to recognize “stable” by ijc_fsi calculator. This bit should be set to H'2. (Only when fast_ijk_en = 1, as bit 31) |
| 19 to 16 | fast_ijk_setting[3:0] | H'0 | R/W | The period that to rerun calculation by ijc_fsi calculator. This bit should be set to H'4. (Only when fast_ijk_en = 1, as bit 31) |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INTIFSEN | B'0 | R/W | INTIFS Value Setting Enable This bit controls the INTIFS bit of SRCm_IFSVR register. This bit is effective only in asynchronous SRC Mode (bit SRCMD in SRCm_SRCCR register is 0) 0: Disables INTIFS bit of SRCm_IFSVR register 1: Enables INTIFS bit of SRCm_IFSVR register Basically, this bit should be set to 1. |

43.2.22 SRCm IFS Value Setting Register (SRCm_IFSVR)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

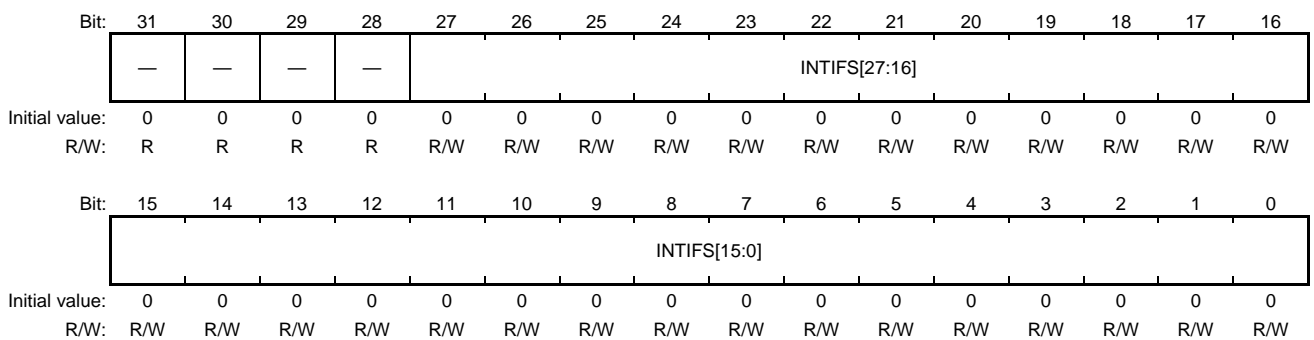

Function: SRCm_IFSVR is a 32-bit readable/writable register that sets the value of INTIFS. The INTIFS is the initial value of FSI of sampling rate conversion function. SRC detects input sampling rate and output sampling rate automatically. By doing this, it calculates the FSI value so that the below formula is satisfied.

$$F_{in}/F_{out} \approx FSI/FSO$$

The INTIFS value is used for the initial value of FSI. If this setting is disabled (INTIFSEN bit of SRCm_IFSCR register is 0), SRC will use FSO for initial value of FSI.

$$INTIFS = F_{in} \times FSO/F_{out}$$

- Note:
- Fin: Input sampling frequency
 - Fout: Output sampling frequency
 - FSI: Input sampling rate
 - FSO: Output sampling rate (Fixed value: $2^{22} = H'040_0000$)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 28 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 27 to 0 | INTIFS[27:0] | H'000_0000 | R/W | Initial Value of FSI These bits set initial value of FSI. These bits should be set the ratio of input and output sampling-rate within the range of the restriction decided from channel number. Example: $F_{in} = 32 \text{ kHz}$ $F_{out} = 44.1 \text{ kHz}$ $FSI = 2^{22} \times 32000 / 44100 = 3043485 = H'02E_709D$ For the setting value examples, see Table 43.10. |

Note: When SRCm is used in synchronous mode (SRCMD bit in SRCm_SRCR register is 1), INTIFS can change without SRC initialization. On the operating state, INTIFS can change within 1%. However, the change of the SRC conversion rate means that it will set jitter by manual operation. Evaluate sound quality, and use this function as far as you judged sound quality is no problem. If on the occasion of the change more than 1%, it should do SRC initialization (cf. section 43.3.5(1)(d)) after changing INTIFS.

43.2.23 SRCm SRC Control Register (SRCm_SRCCR)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_SRCCR is a 32-bit readable/writable register that controls the operation of sampling rate converter.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-----|----|----|----|-----|----|----|----|-----|----|----|----|-----------|

| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. | | | | | | | | | | | | | | |

43.2.25 SRCm Buffer Size DATA RAM Setting Register (SRCm_BSDSR)

Note: m = 5 to 8

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCn_BSDSR is a 32-bit readable/writable register that controls the buffer size of DATA RAM. This register should set with SRCm_BSISR register. See Table 43.8 and 43.9 for the combination of settings.

| Bit | Bit Name | Initial Value | R/W | Description | | | | | | | | | | | | | | |
|---------------|----------------|---------------|-----|--|---------------|-------|---------|-------|---------|-------|---------|-------|---------|-------|---------|-------|-------|-------|
| 31 to 27 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. | | | | | | | | | | | | | | |
| 26 to 16 | BUFDATA [10:0] | H'000 | R/W | These bits should be set appropriately according to the following table. Refer to Table 43.8 and 43.9 for the combination of FSO/FSI ratio, channel number, and latency. | | | | | | | | | | | | | | |
| | | | | <table border="1"> <thead> <tr> <th>FSO/FSI Ratio</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>6 - 1/6</td> <td>H'240</td> </tr> <tr> <td>6 - 1/4</td> <td>H'180</td> </tr> <tr> <td>6 - 1/3</td> <td>H'120</td> </tr> <tr> <td>6 - 1/2</td> <td>H'0C0</td> </tr> <tr> <td>6 - 2/3</td> <td>H'090</td> </tr> <tr> <td>6 - 1</td> <td>H'060</td> </tr> </tbody> </table> | FSO/FSI Ratio | Value | 6 - 1/6 | H'240 | 6 - 1/4 | H'180 | 6 - 1/3 | H'120 | 6 - 1/2 | H'0C0 | 6 - 2/3 | H'090 | 6 - 1 | H'060 |
| FSO/FSI Ratio | Value | | | | | | | | | | | | | | | | | |
| 6 - 1/6 | H'240 | | | | | | | | | | | | | | | | | |
| 6 - 1/4 | H'180 | | | | | | | | | | | | | | | | | |
| 6 - 1/3 | H'120 | | | | | | | | | | | | | | | | | |
| 6 - 1/2 | H'0C0 | | | | | | | | | | | | | | | | | |
| 6 - 2/3 | H'090 | | | | | | | | | | | | | | | | | |
| 6 - 1 | H'060 | | | | | | | | | | | | | | | | | |
| 15 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. | | | | | | | | | | | | | | |

43.2.26 SRCm Buffer Size IJEC RAM Setting Register (SRCm_BSISR)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm_BSISR is a 32-bit readable/writable register that controls the precision value and buffer size of IJEC RAM. This register should set with SRCm_BSISR/SRCn_BSISR register. See Table 43.8 and 43.9 for the combination of settings.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|--|
| 31 to 22 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 21 to 16 | IJECPREC[5:0] | H'00 | R/W | These bits should be set to H'10. |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 to 0 | IJECSIZE[8:0] | H'000 | R/W | These bits should be set appropriately according to the following table. |

Refer to Table 43.8 and 43.9 for the combination of FSO/FSI ratio, channel number, and latency.

| FSO/FSI Ratio | Value |
|---------------|-------|
| 6 - 1/6 | H'60 |
| 6 - 1/4 | H'40 |
| 6 - 1/3 | H'30 |
| 6 - 1/2 | H'20 |
| 6 - 2/3 | H'20 |
| 6 - 1 | H'20 |

43.2.27 CTUn Software Reset Register (CTUn_SWRSR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_SWRSR is a 32-bit readable/writable register that controls operation/reset of the CTU internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SWRST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SWRST | B'1 | R/W | Software Reset While this bit is 0, the CTU internal circuits are put in the reset state. CTUn_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the CTU 1: Operating state |

43.2.28 CTUn CTU Initialization Register (CTUn_CTUIR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_CTUIR is a 32-bit readable/writable register that initializes the operation of the CTU internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | INIT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INIT | B'1 | R/W | Initialization of Processing When this bit is set to 1, the CTU processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers) |

43.2.29 CTUn Audio Information Register (CTUn_ADINR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_ADINR is a 32-bit readable/writable register that selects channel number.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|------------|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | CHNUM[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | CHNUM[3:0] | H'0 | R/W | Channel Number These bits set the input data channel number. B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved |

43.2.30 CTUn CTU Pass Mode Register (CTUn_CPMDR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_CPMDR is a 32-bit readable/writable register that controls the pass of channel data for each output.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 28 | SELOT0[3:0] | H'0 | R/W | Select output data for channel 0 These bits select the output data for channel 0. B'0000: Connect input data of channel 0 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 27 to 24 | SELOT1[3:0] | H'0 | R/W | <p>Select output data for channel 1</p> <p>These bits select the output data for channel 1.</p> <p>B'0000: Connect input data of channel 1 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |
| 23 to 20 | SELOT2[3:0] | H'0 | R/W | <p>Select output data for channel 2</p> <p>These bits select the output data for channel 2.</p> <p>B'0000: Connect input data of channel 2 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 19 to 16 | SELOT3[3:0] | H'0 | R/W | <p>Select output data for channel 3</p> <p>These bits select the output data for channel 3.</p> <p>B'0000: Connect input data of channel 3 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |
| 15 to 12 | SELOT4[3:0] | H'0 | R/W | <p>Select output data for channel 4</p> <p>These bits select the output data for channel 4.</p> <p>B'0000: Connect input data of channel 4 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-------------|---------------|-----|---|
| 11 to 8 | SELOT5[3:0] | H'0 | R/W | <p>Select output data for channel 5</p> <p>These bits select the output data for channel 5.</p> <p>B'0000: Connect input data of channel 5 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |
| 7 to 4 | SELOT6[3:0] | H'0 | R/W | <p>Select output data for channel 6</p> <p>These bits select the output data for channel 6.</p> <p>B'0000: Connect input data of channel 6 B'0001: Connect input data of channel 0 B'0010: Connect input data of channel 1 B'0011: Connect input data of channel 2 B'0100: Connect input data of channel 3 B'0101: Connect input data of channel 4 B'0110: Connect input data of channel 5 B'0111: Connect input data of channel 6 B'1000: Connect input data of channel 7 B'1001: Connect calculated data by scale values of matrix row 0 B'1010: Connect calculated data by scale values of matrix row 1 B'1011: Connect calculated data by scale values of matrix row 2 B'1100: Connect calculated data by scale values of matrix row 3 Others: Setting prohibited.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-------------|---------------|-----|--|
| 3 to 0 | SELOT7[3:0] | H'0 | R/W | <p>Select output data for channel 7.</p> <p>These bits select the output data for channel 7.</p> <p>B'0000: Connect input data of channel 7</p> <p>B'0001: Connect input data of channel 0</p> <p>B'0010: Connect input data of channel 1</p> <p>B'0011: Connect input data of channel 2</p> <p>B'0100: Connect input data of channel 3</p> <p>B'0101: Connect input data of channel 4</p> <p>B'0110: Connect input data of channel 5</p> <p>B'0111: Connect input data of channel 6</p> <p>B'1000: Connect input data of channel 7</p> <p>B'1001: Connect calculated data by scale values of matrix row 0</p> <p>B'1010: Connect calculated data by scale values of matrix row 1</p> <p>B'1011: Connect calculated data by scale values of matrix row 2</p> <p>B'1100: Connect calculated data by scale values of matrix row 3</p> <p>Others: Setting prohibited.</p> |

43.2.31 CTUn Scale Mode Register (CTUn_SCMDR)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_SCMDR is a 32-bit readable/writable register that selects the number of rows calculated by matrix.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|-----------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| | | | | | | | | | | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | SCMD[2:0] | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

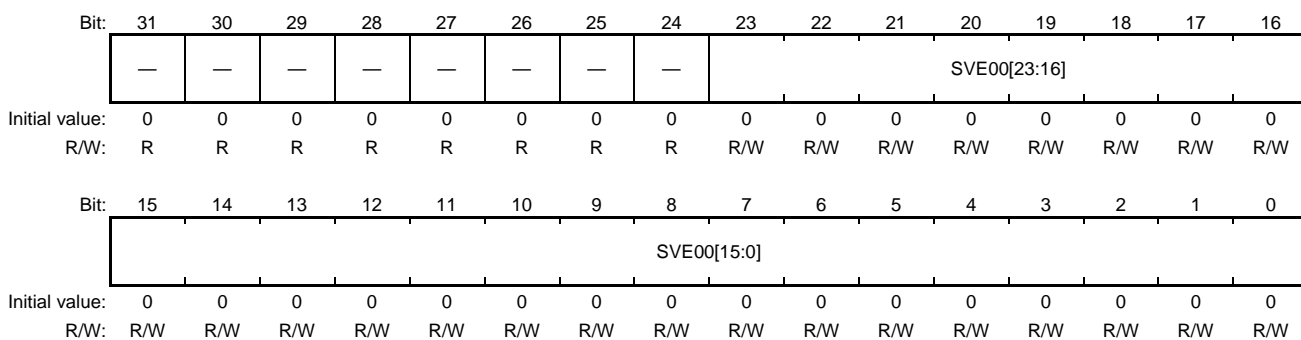

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 to 0 | SCMD[2:0] | H'0 | R/W | The number of rows calculated by matrix These bits select the number of rows calculated by matrix by the scale values. B'000: No operation B'001: Calculate matrix row 0 by scale values. B'010: Calculate matrix row 0 and 1 by scale values. B'011: Calculate matrix row 0 and 1 and 2 by scale values. B'100: Calculate matrix row 0 and 1 and 2 and 3 by scale values. Others: Setting prohibited. |

43.2.32 CTUn Scale Value e00 Register (CTUn_SV00R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_SV00R is a 32-bit readable/writable register that sets the scale value for channel 0 of matrix row 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | SVE00[23:0] | H'00_0000 | R/W | Scale Value e00 for Input Channel 0 of Matrix Row 0 These bits set the scale value for input data of channel 0 of matrix row 0. SVE00[23]: Sign bit SVE00[22]: Integer bit SVE00[21:0]: Decimal bits |

| plus | | | minus | | |
|-----------|-----------------------|-----------|-----------|-----------------------|-------|
| Value | [time] | [dB] | Value | [time] | [dB] |
| H'7F_FFFF | 2 | 6 | H'80_0000 | 2 | 6 |
| | | | | | |
| H'40_0000 | 1 | 0 | H'C0_0000 | 1 | 0 |
| | | | | | |
| H'00_0001 | 2.38×10^{-7} | -132 | | | |
| H'00_0000 | 0 (Mute) | $-\infty$ | H'FF_FFFF | 2.38×10^{-7} | -132 |

43.2.33 CTUn Scale Value e01 Register (CTUn_SV01R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_SV01R is a 32-bit readable/writable register that sets the scale value for channel 1 of matrix row 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | SVE01[23:0] | H'00_0000 | R/W | Scale Value e01 for Input Channel 1 of Matrix Row 0 These bits set the scale value for input data of channel 1 of matrix row 0. SVE01[23]: Sign bit SVE01[22]: Integer bit SVE01[21:0]: Decimal bits |

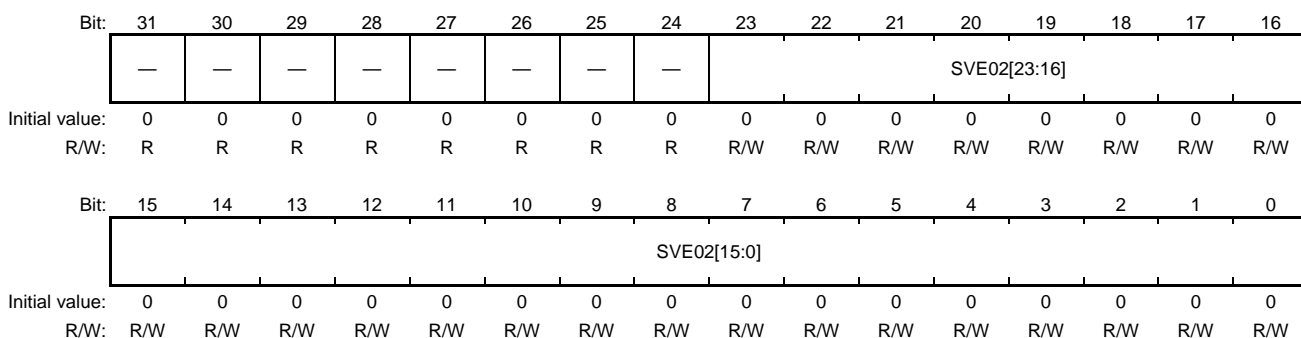

| plus | | | minus | | |
|-----------|-----------------------|-----------|-----------|-----------------------|-------|
| Value | [time] | [dB] | Value | [time] | [dB] |
| H'7F_FFFF | 2 | 6 | H'80_0000 | 2 | 6 |
| | | | | | |
| H'40_0000 | 1 | 0 | H'C0_0000 | 1 | 0 |
| | | | | | |
| H'00_0001 | 2.38×10^{-7} | -132 | | | |
| H'00_0000 | 0 (Mute) | $-\infty$ | H'FF_FFFF | 2.38×10^{-7} | -132 |

43.2.34 CTUn Scale Value e02 Register (CTUn_SV02R)

Note: n = 00, 01, 02, 03, 10, 11, 12, or 13

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CTUn_SV02R is a 32-bit readable/writable register that sets the scale value for channel 2 of matrix row 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

43.2.64 MIXp Software Reset Register (MIXp_SWRSR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_SWRSR is a 32-bit readable/writable register that controls operation/reset of the MIX internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SWRST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SWRST | B'1 | R/W | Software Reset While this bit is 0, the MIX internal circuits are put in the reset state. MIXp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the MIX 1: Operating state |

43.2.65 MIXp MIX Initialization Register (MIXp_MIXIR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MIXIR is a 32-bit readable/writable register that initializes the operation of the MIX internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | INIT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INIT | B'1 | R/W | Initialization of Processing When this bit is set to 1, the MIX processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers) |

43.2.66 MIXp Audio Information Register (MIXp_ADINR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_ADINR is a 32-bit readable/writable register that selects channel number.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|------------|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | CHNUM[3:0] | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 3 to 0 | CHNUM[3:0] | H'0 | R/W | Channel Number These bits set the output data channel number B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved |

43.2.67 MIXp MIX Mode Register (MIXp_MIXMR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MIXMR is a 32-bit readable/writable register that controls the mix mode.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MIX MODE |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | MIXMODE | B'0 | R/W | MIX Mode This bit controls the mix mode. 0: Selects volume step mixer 1: Selects volume ramp mixer |

43.2.68 MIXp MIX Volume Period Register (MIXp_MVPDR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MVPDR is a 32-bit readable/writable register that sets the value of the change of the volume a sample.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|--------------|-----|-----|-----|----|----|----|-------------|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| | | | | | | | | | | | | | | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | MXPDPUP[3:0] | | | — | — | — | — | MXPDDW[3:0] | | | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | MXPDPUP[3:0] | H'0 | R/W | MIX Period for Volume Up These bits set the decibel value that changed by one sample for volume up. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used. B'0000: 128 dB / 1 sample B'0001: 64 dB / 1 sample B'0010: 32 dB / 1 sample B'0011: 16 dB / 1 sample B'0100: 8 dB / 1 sample B'0101: 4 dB / 1 sample B'0110: 2 dB / 1 sample B'0111: 1 dB / 1 sample B'1000: 0.5 dB / 1 sample B'1001: 0.25 dB / 1 sample B'1010: 0.125 dB / 1 sample B'1011 to B'1111: Reserved |
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-------------|---------------|-----|---|
| 3 to 0 | MXPDDW[3:0] | H'0 | R/W | <p>MIX Period for Volume Down</p> <p>These bits set the decibel value that changed by one sample for volume down. And when MIXMODE bit of MIXp_MIXMR register is 1, this setting can be used.</p> <p>B'0000: -128 dB / 1 sample B'0001: -64 dB / 1 sample B'0010: -32 dB / 1 sample B'0011: -16 dB / 1 sample B'0100: -8 dB / 1 sample B'0101: -4 dB / 1 sample B'0110: -2 dB / 1 sample B'0111: -1 dB / 1 sample B'1000: -0.5 dB / 1 sample B'1001: -0.25 dB / 1 sample B'1010: -0.125 dB / 1 sample B'1011 to B'1111: Reserved</p> |

43.2.69 MIXp MIX Decibel A Register (MIXp_MDBAR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MDBAR is a 32-bit readable/writable register that sets the decibel (gain level) of system A.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | MIXDBA[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | MIXDBA[9:0] | H'000 | R/W | dB of System A These bits control the decibel (gain level) of system A. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB. |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-------|--------|---------|-------|----------------------|---------|
| H'000 | 1 | 0 | | | |
| | | | H'091 | 0.125 | -18.125 |
| H'031 | 0.5 | -6.125 | | | |
| | | | H'3FE | 4.1×10^{-7} | -127.75 |
| H'061 | 0.25 | -12.125 | H'3FF | 0 (Mute) | -∞ |

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.70 MIXp MIX Decibel B Register (MIXp_MDBBR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MDBBR is a 32-bit readable/writable register that sets the decibel (gain level) of system B.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | MIXDBB[9:0] | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|---|-------------|---------------|-------|---|-----------|--------|------|-------|--------|------|-------|---|---|-------|-------|-------|-------|-------|-------|-------|-------|---------|-------|-----|--------|-------|-------|-------|-------|-------|-------|-------|----------------------|---------|-------|------|---------|-------|----------|-----------|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| 9 to 0 | MIXDBB[9:0] | H'000 | R/W | dB of System B These bits control the decibel (gain level) of system B. The value can select 1024 points from 0 dB to $-\infty$ dB at intervals of 0.125 dB. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

43.2.71 MIXp MIX Decibel C Register (MIXp_MDBCR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MDBCR is a 32-bit readable/writable register that sets the decibel (gain level) of system C.

| | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|---|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| | — | — | — | — | — | — | MIXDBC[9:0] | | | | | | | | | | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | MIXDBC[9:0] | H'000 | R/W | dB of System C These bits control the decibel (gain level) of system C. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB. |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-------|--------|---------|-------|----------------------|---------|
| H'000 | 1 | 0 | | | |
| | | | H'091 | 0.125 | -18.125 |
| H'031 | 0.5 | -6.125 | | | |
| | | | H'3FE | 4.1×10^{-7} | -127.75 |
| H'061 | 0.25 | -12.125 | H'3FF | 0 (Mute) | -∞ |

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.72 MIXp MIX Decibel D Register (MIXp_MDBDR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MDBDR is a 32-bit readable/writable register that sets the decibel (gain level) of system D.

| | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|---|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |

| The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

43.2.73 MIXp MIX Decibel Enable Register (MIXp_MDBER)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MDBER is a 32-bit readable/writable register that controls the dB value.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MIX DBEN |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | MIXDBEN | B'0 | R/W | MIX dB Enable This bit controls the dB value that sets in MIXp_MDBAR, MIXp_MDBBR, MIXp_MDBCR and MIXp_MDBDR registers. 0: Disables the setting of dB 1: Enables the setting of dB |

43.2.74 MIXp MIX Status Register (MIXp_MIXSR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: MIXp_MIXSR is a 32-bit readable register that indicates the status of the volume ramp.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | MRPSTS | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 2 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 1, 0 | MRPSTS | H'0 | R | MIX Volume Ramp Status These bits indicate the volume ramp status of mix operation. B'00: Level of volume ramp is stable B'01: Volume ramp down B'10: Volume ramp up Others: Setting prohibited. |

43.2.75 DVCp Software Reset Register (DVCp_SWRSR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_SWRSR is a 32-bit readable/writable register that controls operation/reset of the DVC internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SWRST |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SWRST | B'1 | R/W | Software Reset While this bit is 0, the DVC internal circuits are put in the reset state. DVCp_* registers except this register are reset. Therefore, they should be set again after the reset is canceled. 0: Resets the DVC 1: Operating state |

43.2.76 DVCp DVU Initialization Register (DVCp_DVUIR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_DVUIR is a 32-bit readable/writable register that initializes the operation of the DVC internal circuits.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | INIT |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | INIT | B'1 | R/W | Initialization of Processing When this bit is set to 1, the DVC processing is initialized. This bit should be cleared to 0 after it was set to 1. 0: Processing State 1: Initialization (sets the initial setting of other registers) |

43.2.77 DVCp Audio Information Register (DVCp_ADINR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_ADINR is a 32-bit readable/writable register that selects channel number and bit length of output audio data.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|------------|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | OTBL[4:0] | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | CHNUM[3:0] | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 to 16 | OTBL[4:0] | H'00 | R/W | Bit Length of Output Audio Data. These bits set the bit length of output audio data. B'0_0000: 24 bits B'0_0001: Reserved B'0_0010: 22 bits B'0_0011: Reserved B'0_0100: 20 bits B'0_0101: Reserved B'0_0110: 18 bits B'0_0111: Reserved B'0_1000: 16 bits B'0_1001 to 0_1111: Reserved B'1_0000: 8 bits B'1_0001 to 1_1111: Reversed |
| 15 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|------------|-----------------|----------------------|------------|--|
| 3 to 0 | CHNUM[3:0] | H'0 | R/W | Channel Number These bits set the output data channel number B'0000: 0 (None) B'0001: 1 channel B'0010: 2 channels B'0011: Reserved B'0100: 4 channels B'0101: Reserved B'0110: 6 channels B'0111: Reserved B'1000: 8 channels B'1001 to B'1111: Reserved |

43.2.78 DVCp DVU Control Register (DVCp_DVUCR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_DVUCR is a 32-bit readable/writable register that selects the mode of function to operate.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|------|----|----|----|------|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | VVMD | — | — | — | VRMD | — | — | — | ZCMD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | VVMD | B'0 | R/W | Select Digital Volume Value Mode This bit selects the digital volume value function. 0: Sleep the digital volume value function 1: Use the digital volume value function |
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | VRMD | B'0 | R/W | Select Volume Ramp Mode This bit selects the volume ramp function. 0: Sleep the volume ramp function 1: Use the volume ramp function |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | ZCMD | B'0 | R/W | Select Zero Cross Mute Mode This bit selects the zero cross mute function. 0: Sleep the zero cross mute function 1: Use the zero cross mute function |

43.2.79 DVCp Zero Cross Mute Control Register (DVCp_ZCMCR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_ZCMCR is a 32-bit readable/writable register that controls the operation of the zero cross mute function for each channel.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | ZCEN7 | ZCEN6 | ZCEN5 | ZCEN4 | ZCEN3 | ZCEN2 | ZCEN1 | ZCEN0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 | ZCEN7 | B'0 | R/W | Zero Cross Mute Enable for Channel 7 This bit controls the operation of the zero cross mute function for channel 7. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 6 | ZCEN6 | B'0 | R/W | Zero Cross Mute Enable for Channel 6 This bit controls the operation of the zero cross mute function for channel 6. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 5 | ZCEN5 | B'0 | R/W | Zero Cross Mute Enable for Channel 5 This bit controls the operation of the zero cross mute function for channel 5. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 4 | ZCEN4 | B'0 | R/W | Zero Cross Mute Enable for Channel 4 This bit controls the operation of the zero cross mute function for channel 4. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 3 | ZCEN3 | B'0 | R/W | Zero Cross Mute Enable for Channel 3 This bit controls the operation of the zero cross mute function for channel 3. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 2 | ZCEN2 | B'0 | R/W | Zero Cross Mute Enable for Channel 2 This bit controls the operation of the zero cross mute function for channel 2. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 1 | ZCEN1 | B'0 | R/W | Zero Cross Mute Enable for Channel 1 This bit controls the operation of the zero cross mute function for channel 1. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |
| 0 | ZCEN0 | B'0 | R/W | Zero Cross Mute Enable for Channel 0 This bit controls the operation of the zero cross mute function for channel 0. 0: Disables the operation of the zero cross mute function 1: Enables the operation of the zero cross mute function |

43.2.80 DVCp Volume Ramp Control Register (DVCp_VRCTR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VRCTR is a 32-bit readable/writable register that controls the operation of the volume ramp function for each channel.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | VREN7 | VREN6 | VREN5 | VREN4 | VREN3 | VREN2 | VREN1 | VREN0 |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 | VREN7 | B'0 | R/W | Volume Ramp Enable for Channel 7 This bit controls the operation of the volume ramp function for channel 7. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 6 | VREN6 | B'0 | R/W | Volume Ramp Enable for Channel 6 This bit controls the operation of the volume ramp function for channel 6. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 5 | VREN5 | B'0 | R/W | Volume Ramp Enable for Channel 5 This bit controls the operation of the volume ramp function for channel 5. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 4 | VREN4 | B'0 | R/W | Volume Ramp Enable for Channel 4 This bit controls the operation of the volume ramp function for channel 4. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 3 | VREN3 | B'0 | R/W | Volume Ramp Enable for Channel 3 This bit controls the operation of the volume ramp function for channel 3. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 2 | VREN2 | B'0 | R/W | Volume Ramp Enable for Channel 2 This bit controls the operation of the volume ramp function for channel 2. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 1 | VREN1 | B'0 | R/W | Volume Ramp Enable for Channel 1 This bit controls the operation of the volume ramp function for channel 1. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |
| 0 | VREN0 | B'0 | R/W | Volume Ramp Enable for Channel 0 This bit controls the operation of the volume ramp function for channel 0. 0: Disables the operation of the volume ramp function 1: Enables the operation of the volume ramp function |

Note: All of these bits should be set to 1 when VRMD bit of DVCP_DVUCR register is 1.

43.2.81 DVCp Volume Ramp Period Register (DVCp_VRPDR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VRPDR is a 32-bit readable/writable register that controls.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|-------------|-----|-----|-----|-----|----|----|-------------|-----|-----|-----|-----|-----|

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 to 8 | VRPDUP[4:0] | H'00 | R/W | Volume Ramp Period for Volume Up B'0_0000: 1 [sample] (128 dB/1 step) B'0_0001: 2 [sample] (64 dB/1 step) B'0_0010: 4 [sample] (32 dB/1 step) B'0_0011: 8 [sample] (16 dB/1 step) B'0_0100: 16 [sample] (8 dB/1 step) B'0_0101: 32 [sample] (4 dB/1 step) B'0_0110: 64 [sample] (2 dB/1 step) B'0_0111: 128 [sample] (1 dB/1 step) B'0_1000: 256 [sample] (0.5 dB/1 step) B'0_1001: 512 [sample] (0.25 dB/1 step) B'0_1010: 1024 [sample] (0.125 dB/1 step) B'0_1011: 2048 [sample] (0.125 dB/2 steps) B'0_1100: 4096 [sample] (0.125 dB/4 steps) B'0_1101: 8192 [sample] (0.125 dB/8 steps) B'0_1110: 16384 [sample] (0.125 dB/16 steps) B'0_1111: 32768 [sample] (0.125 dB/32 steps) B'1_0000: 65536 [sample] (0.125 dB/64 steps) B'1_0001: 131072 [sample] (0.125 dB/128 steps) B'1_0010: 262144 [sample] (0.125 dB/256 steps) B'1_0011: 524288 [sample] (0.125 dB/512 steps) B'1_0100: 1048576 [sample] (0.125 dB/1024 steps) B'1_0101: 2097152 [sample] (0.125 dB/2048 steps) B'1_0110: 4194304 [sample] (0.125 dB/4096 steps) B'1_0111: 8388608 [sample] (0.125 dB/8192 steps) B'1_1000 to B'1_1111: Reserved |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|-------------|---------------|-----|--|
| 7 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 to 0 | VRPDDW[4:0] | H'00 | R/W | Volume Ramp Period for Volume Down B'0_0000: 1 [sample] (-128 dB/1 step) B'0_0001: 2 [sample] (-64 dB/1 step) B'0_0010: 4 [sample] (-32 dB/1 step) B'0_0011: 8 [sample] (-16 dB/1 step) B'0_0100: 16 [sample] (-8 dB/1 step) B'0_0101: 32 [sample] (-4 dB/1 step) B'0_0110: 64 [sample] (-2 dB/1 step) B'0_0111: 128 [sample] (-1 dB/1 step) B'0_1000: 256 [sample] (-0.5 dB/1 step) B'0_1001: 512 [sample] (-0.25 dB/1 step) B'0_1010: 1024 [sample] (-0.125 dB/1 step) B'0_1011: 2048 [sample] (-0.125 dB/2 steps) B'0_1100: 4096 [sample] (-0.125 dB/4 steps) B'0_1101: 8192 [sample] (-0.125 dB/8 steps) B'0_1110: 16384 [sample] (-0.125 dB/16 steps) B'0_1111: 32768 [sample] (-0.125 dB/32 steps) B'1_0000: 65536 [sample] (-0.125 dB/64 steps) B'1_0001: 131072 [sample] (-0.125 dB/128 steps) B'1_0010: 262144 [sample] (-0.125 dB/256 steps) B'1_0011: 524288 [sample] (-0.125 dB/512 steps) B'1_0100: 1048576 [sample] (-0.125 dB/1024 steps) B'1_0101: 2097152 [sample] (-0.125 dB/2048 steps) B'1_0110: 4194304 [sample] (-0.125 dB/4096 steps) B'1_0111: 8388608 [sample] (-0.125 dB/8192 steps) B'1_1000 to B'1_1111: Reserved |

43.2.82 DVCp Volume Ramp Decibel Register (DVCp_VRDBR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VRDBR is a 32-bit readable/writable register that sets the decibel (gain level) of volume ramp.

| | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|-----------|-----|-----|-----|-----|-----|-----|-----|-----|-----|---|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | |
| | — | — | — | — | — | — | VRDB[9:0] | | | | | | | | | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | VRDB[9:0] | H'000 | R/W | dB of Volume Ramp These bits control the decibel (gain level) of volume ramp. The value can select 1024 points from 0 dB to -∞ dB at intervals of 0.125 dB. |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-------|--------|---------|-------|----------------------|---------|
| H'000 | 1 | 0 | | | |
| | | | H'091 | 0.125 | -18.125 |
| H'031 | 0.5 | -6.125 | | | |
| | | | H'3FE | 4.1×10^{-7} | -127.75 |
| H'061 | 0.25 | -12.125 | H'3FF | 0 (Mute) | -∞ |

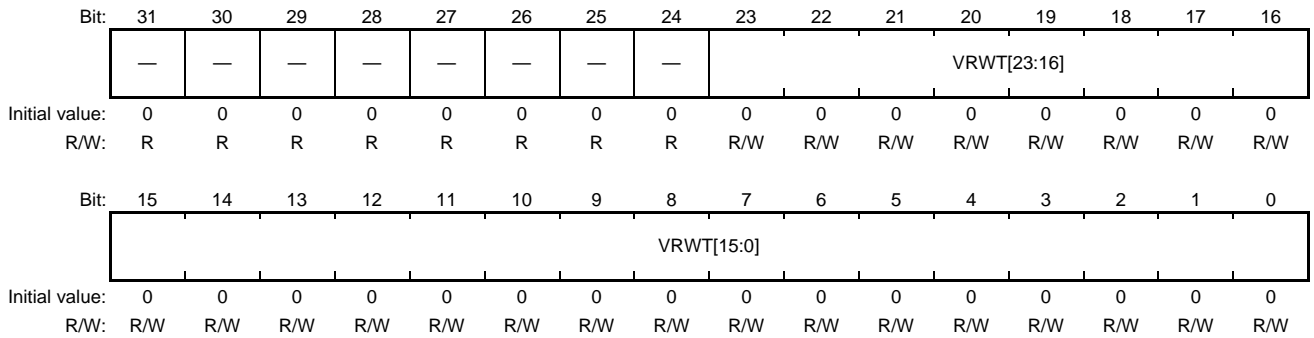

The relation between the setting value and the decibel is shown in Table 43.11, Table 43.12, Table 43.13 and Table 43.14.

43.2.83 DVCp Volume Ramp Wait Time Register (DVCp_VRWTR)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VRWTR is a 32-bit readable/writable register that sets the standby time to start the operation of the volume ramp function.

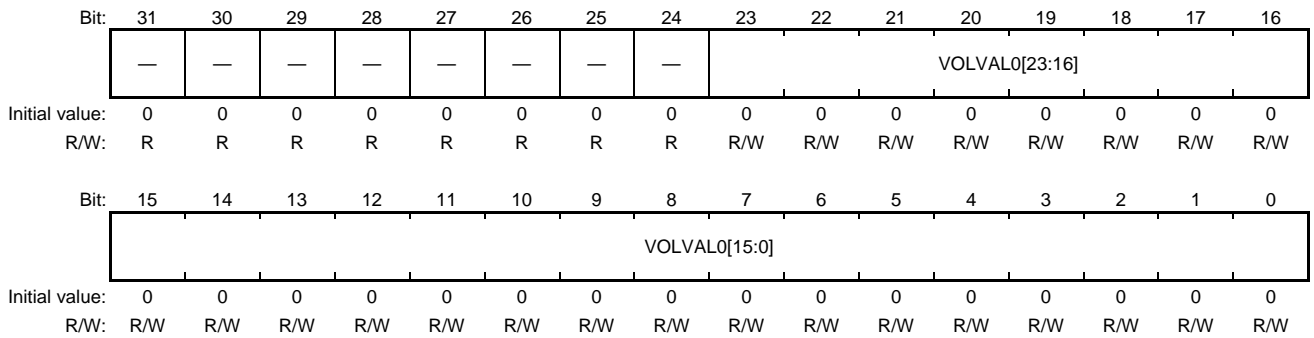

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VRWT[23:0] | H'00_0000 | R/W | Volume Ramp Wait Time These bits set the standby time to adjust the start timing of operation of the volume ramp function when the setting of DVCp_VRDBR register is changed. If the internal counter of the DVC logic reached to the value of these bits, the volume ramp function starts to operate to change the volume to target volume of DVCp_VRDBR register. |

43.2.84 DVCp Volume Value Setting 0 Register (DVCp_VOL0R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL0R is a 32-bit readable/writable register that sets digital volume value for channel 0.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL0 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 0 These bits set the digital volume of channel 0. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL0[23]: Sign bit (The write value should be 0.) VOLVAL0[22:20]: Integer bits VOLVAL0[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.85 DVCp Volume Value Setting 1 Register (DVCp_VOL1R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL1R is a 32-bit readable/writable register that sets digital volume value for channel 1.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL1 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 1 These bits set the digital volume of channel 1. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL1[23]: Sign bit (The write value should be 0.) VOLVAL1[22:20]: Integer bits VOLVAL1[19:0]: Decimal bits |

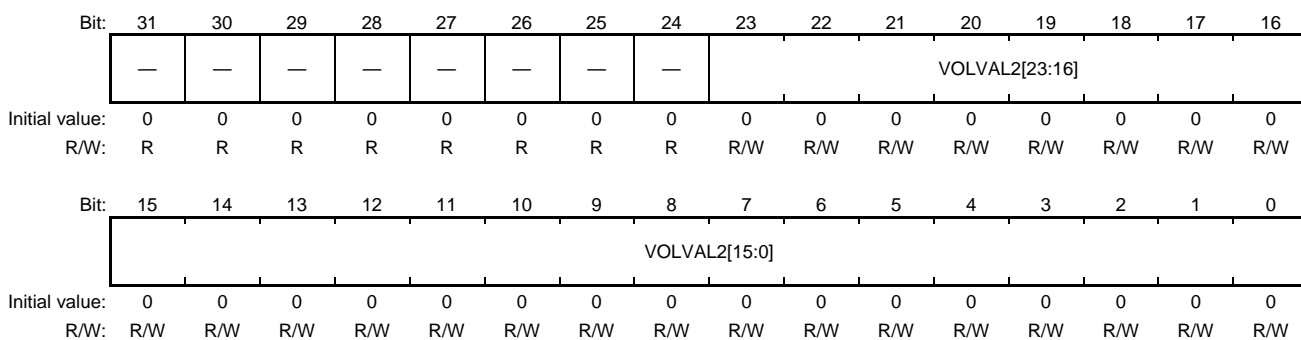

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.86 DVCp Volume Value Setting 2 Register (DVCp_VOL2R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL2R is a 32-bit readable/writable register that sets digital volume value for channel 2.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL2 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 2 These bits set the digital volume of channel 2. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL2[23]: Sign bit (The write value should be 0.) VOLVAL2[22:20]: Integer bits VOLVAL2[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.87 DVCp Volume Value Setting 3 Register (DVCp_VOL3R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL3R is a 32-bit readable/writable register that sets digital volume value for channel 3.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL3 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 3 These bits set the digital volume of channel 3. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL3[23]: Sign bit (The write value should be 0.) VOLVAL3[22:20]: Integer bits VOLVAL3[19:0]: Decimal bits |

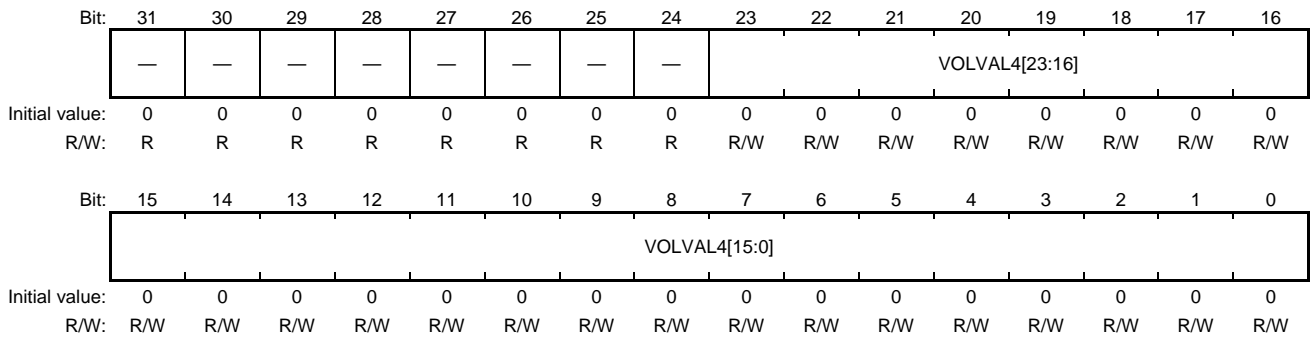

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.88 DVCp Volume Value Setting 4 Register (DVCp_VOL4R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL4R is a 32-bit readable/writable register that sets digital volume value for channel 4.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL4 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 4 These bits set the digital volume of channel 4. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL4[23]: Sign bit (The write value should be 0.) VOLVAL4[22:20]: Integer bits VOLVAL4[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.89 DVCp Volume Value Setting 5 Register (DVCp_VOL5R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL5R is a 32-bit readable/writable register that sets digital volume value for channel 5.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL5 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 5 These bits set the digital volume of channel 5. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL5[23]: Sign bit (The write value should be 0.) VOLVAL5[22:20]: Integer bits VOLVAL5[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.90 DVCp Volume Value Setting 6 Register (DVCp_VOL6R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL6R is a 32-bit readable/writable register that sets digital volume value for channel 6.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL6 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 6 These bits set the digital volume of channel 6. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL6[23]: Sign bit (The write value should be 0.) VOLVAL6[22:20]: Integer bits VOLVAL6[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.91 DVCp Volume Value Setting 7 Register (DVCp_VOL7R)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_VOL7R is a 32-bit readable/writable register that sets digital volume value for channel 7.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|--|
| 31 to 24 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 23 to 0 | VOLVAL7 [23:0] | H'00_0000 | R/W | Digital Volume Value for Channel 7 These bits set the digital volume of channel 7. The maximum value is 8-time (18 dB) and the minimum value is 0 (-∞ dB). VOLVAL7[23]: Sign bit (The write value should be 0.) VOLVAL7[22:20]: Integer bits VOLVAL7[19:0]: Decimal bits |

| Value | [time] | [dB] | Value | [time] | [dB] |
|-----------|--------|------|-----------|----------------------|------|
| H'7F_FFFF | 8 | 18 | H'08_0000 | 0.5 | -6 |
| ... | ... | ... | ... | ... | ... |
| H'10_0000 | 1 | 0 | H'00_0001 | 9.5×10^{-7} | -120 |
| ... | ... | ... | H'00_0000 | 0 | -∞ |

43.2.92 DVCp DVU Enable Register (DVCp_DVUER)

Note: p = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: DVCp_DVUER is a 32-bit readable/writable register that controls the setting of DVC registers.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|

| 24 | ALLZSTS_ie | B'0 | R/W | allzsts_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 23 | ZSTS7_ie | B'0 | R/W | zsts7_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 22 | ZSTS6_ie | B'0 | R/W | zsts6_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 21 | ZSTS5_ie | B'0 | R/W | zsts5_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 20 | ZSTS4_ie | B'0 | R/W | zsts4_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 19 | ZSTS3_ie | B'0 | R/W | zsts3_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 18 | ZSTS2_ie | B'0 | R/W | zsts2_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 17 | ZSTS1_ie | B'0 | R/W | zsts1_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|---|
| 16 | ZSTS0_ie | B'0 | R/W | zsts0_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 15 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 4 | VRSTS_LEVEL_ie | B'0 | R/W | vrsts_level_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 3 | VRSTS_MUTE_ie | B'0 | R/W | vrsts_mute_int_enable 0: Interrupt outputs are disabled. 1: Interrupt outputs are enabled. |
| 2 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

43.2.95 SRCm in Write Data Register (SRCm in_BUSIF)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm in_BUSIF are window registers in which data is stored during data transfer via SRCm in_BUSIF. These registers are used for transmission.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|---------------|---------------|-----|---|
| 31 to 0 | SRCm in_BUSIF | All 0 | -/W | These bits are a window register in which data is stored during data transfer via SRCmin_BUSIF. This register is used for transmission. |

43.2.96 SRCm out Read Data Register (SRCm out_BUSIF)

Note: m = 0 to 9

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: SRCm out_BUSIF are window registers in which data is stored during data transfer via SRCm out_BUSIF. These registers are used for reception.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|---|
| 31 to 0 | SRCm out_BUSIF | All 0 | R | These bits are a window register in which data is stored during data transfer via SRCmout_BUSIF. This register is used for reception. |

43.2.97 CMDn out Read Data Register (CMDn out_BUSIF)

Note: n = 0 or 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: CMDn out_BUSIF are window registers in which data is stored during data transfer via CMDn out_BUSIF. These registers are used for reception.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|---|
| 31 to 0 | CMDn out_BUSIF | All 0 | R | These bits are a window register in which data is stored during data transfer via CMDnout_BUSIF. This register is used for reception. |

43.3 Operation

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

43.3.1 Procedure for Initializing the SCU

Figures Figure 43.2 and Figure 43.3 show the procedure for initializing the SCU. For details on the register settings, refer to section 43.2, Register Description.

Figure 43.2 Procedure for Initializing the SCU (1)

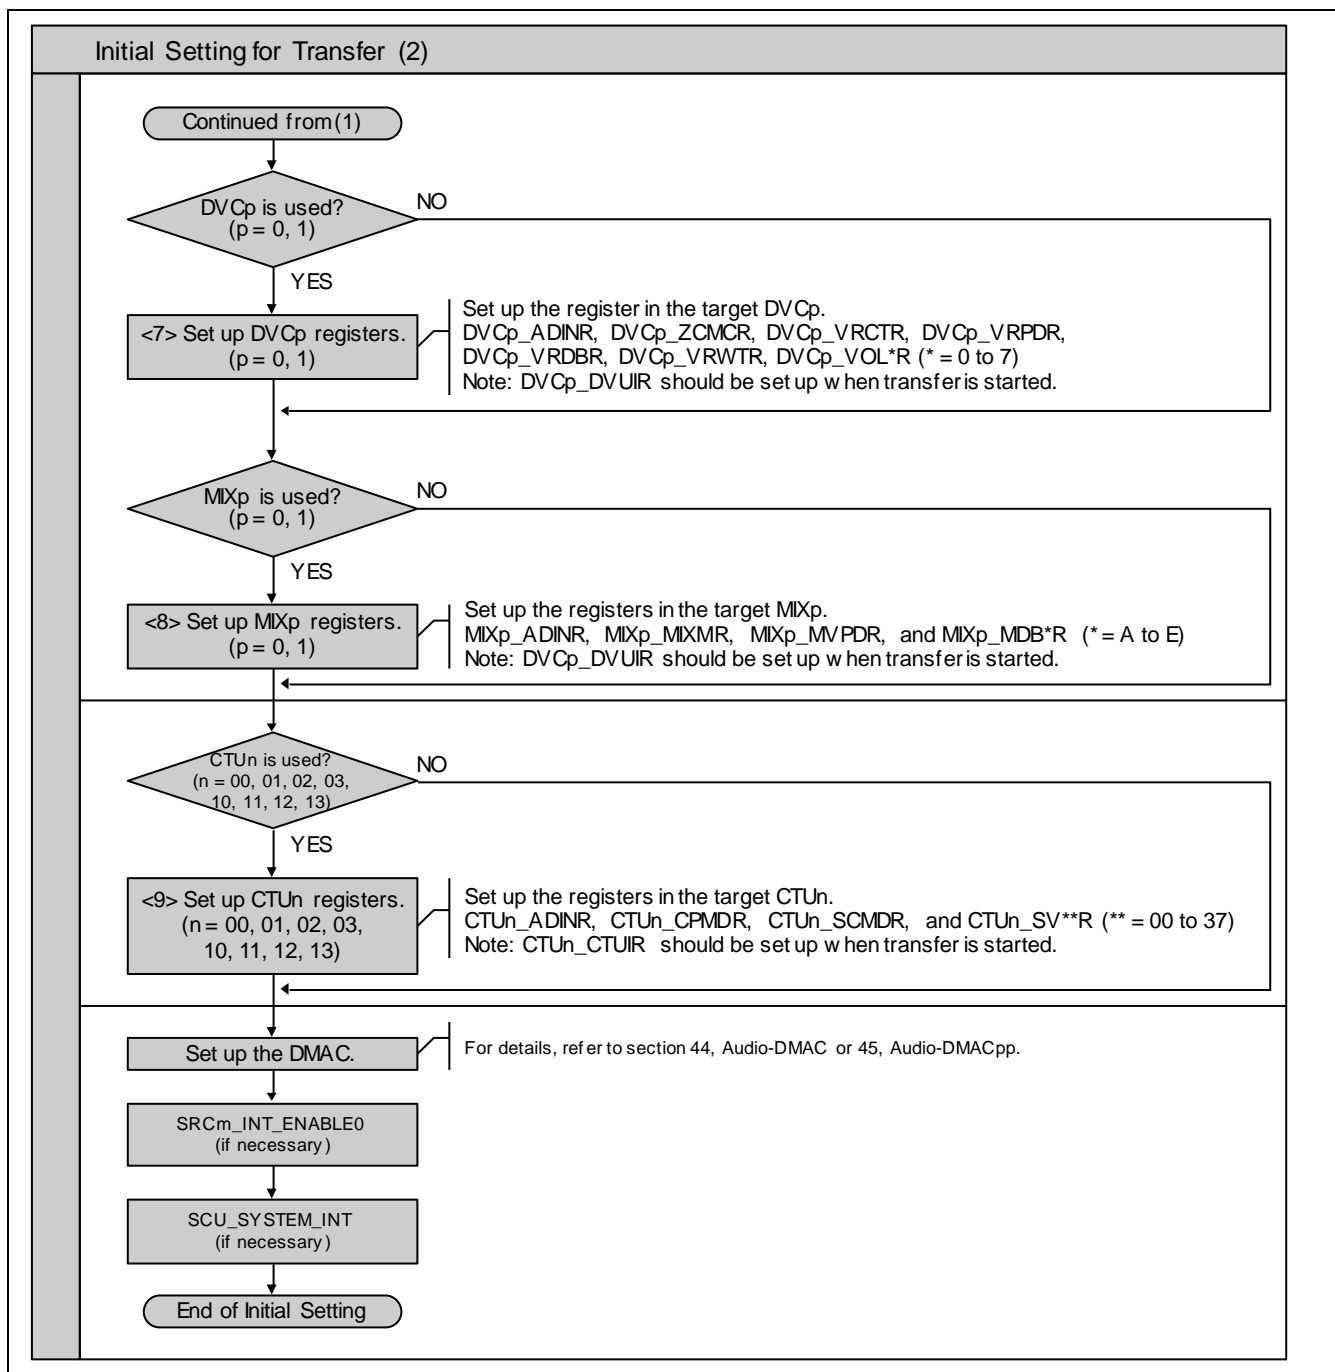

Figure 43.3 Procedure for Initializing the SCU (2)

43.3.2 Procedure for Starting and Stopping Transfer by the SCU

Figure 43.4 shows the procedure for starting and stopping the transfer by the SCU. For details on the register settings, refer to section 43.2, Register Description.

Figure 43.4 Procedure for Starting and Stopping Transfer by the SCU

43.3.3 Data Format for Data Transfer BUSIF

Table 43.3 shows the data formats handled in the SCU. When writing or reading data through the data transfer BUSIF (SRCm in_BUSIF, SRCm out_BUSIF, or CMDn out_BUSIF), align data to match the appropriate data format from those in table Table 43.3. Data alignment can be changed through the SRCm(in/out)_BUSIF_MODE, SRCm_MODE register or CMDnout_BUSIF_MODE register (see section 43.2.4, SRCm_MODE Register (SRCm_MODE) or section 43.2.10, CMDn out_BUSIF_MODE Register (CMDn out_BUSIF_MODE)).

Table 43.3 Data Formats Handled in the SCU

*1. LSB is changeable, depends on stereo data width.

| | |
|---|---|
| 24-bit stereo data, multichannel data | <p>31 8 7 0</p> <p>MSB LSB x x x x</p> |
| 17 to 23-bit stereo data, multichannel data | <p>31 15 to 9 8 7 0</p> <p>MSB LSB x x x x x x</p> <p>*1</p> |
| 16-bit stereo data, multichannel data | <p>31 16 15 0</p> <p>MSB LSB MSB LSB</p> <p>(Lch) (Rch)</p> |
| 9- to 15-bit stereo data, multichannel data | <p>31 23 to 17 16 15 7 to 1 0</p> <p>MSB LSB x x MSB LSB x x</p> <p>(Lch) (Rch)</p> <p>*1 *1</p> |
| 8-bit stereo data | <p>31 24 23 16 15 8 7 0</p> <p>MSB MSB MSB MSB MSB MSB MSB MSB</p> <p>(Rch/2) (Lch/2) (Rch/1) (Lch/1)</p> |
| 16-bit monaural data | <p>31 16 15 0</p> <p>MSB MSB x x x x x x x x</p> |
| 8-bit monaural data | <p>31 24 23 16 15 0</p> <p>MSB MSB x x x x x x x x x x x x x x</p> |

- Notes:
1. Write 0 to the "x" bits in the table when writing data through the data transfer SRCm in_BUSIF. When reading data through the SRCm out_BUSIF or CMDn out_BUSIF, ignore the values read from these bits.
 2. In the 8-bit stereo data format, (Lch/1) and (Rch/1) indicate the data pair to be processed first and (Lch/2) and (Rch/2) indicate the next data pair to be processed.
 3. Only the MSB-first data formats can be used in the SRU.

43.3.4 Changing Data Order in Channel Units

The data order can be changed in channel units in the SCU immediately before input to the SRC and immediately after output from the CMD. Table 43.4 and Table 43.5 show the data places in each data format. Use SRCm_BUSIF_DALIGN or SRCn_BUSIF_DALIGN to change the order before input to the SRC (see section 43.2.2, SRCm_BUSIF_DALIGN Register (SRCm_BUSIF_DALIGN) or section 43.2.3, SRCn_BUSIF_DALIGN Register (SRCn_BUSIF_DALIGN)). Use CMDn_BUSIF_DALIGN to change the order immediately after output from the CMD (see section 43.2.11, CMDn_BUSIF_DALIGN Register (CMDn_BUSIF_DALIGN)). Table 43.4 and Table 43.5 show the data places when these registers are set to the initial values.

Table 43.4 Data Places in Each Data Format (1)

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

43.3.5 SRC Block

The SRC is a block for implementing the sampling rate conversion function, which can convert asynchronous sampling rates.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Four modules support one, two, four, six, or eight channels, and six modules support one or two channels.

Note: * Total harmonic distortion plus noise

[RZ/G2E]

- Asynchronous sampling rate conversion is available
- Supports resolutions up to 24 bits
- High-sound-quality type (THD + N* is -132 dB) and general-sound-quality type (THD + N* is -96 dB)
- Automatically generates antialiasing filter coefficients
- Two modules support one, two, four, six, or eight channels, and eight modules support one or two channels.

Note: * Total harmonic distortion plus noise

Figure 43.5 shows the SRC block diagram.

The "Input audio data" in the figure indicates the data before SRC processing is applied. The "Output audio data" indicates the data after SRC processing is applied.

The "Input data timing" is a signal to show the sampling period for the input audio data. The "Output data timing" is a signal to show the sampling period for the output audio data. When CMD is used in the route, the output data timing signal is the same signal as the output data timing signal used in the CMD.

In synchronous mode specified by setting the SRCMD bit in the SRCm_SRCCR register, when the sync_in bit in the SRCm_MODE register is set to 1, the SRCm doesn't need the input data timing signal, and when the sync_out bit in the SRCm_MODE register is set to 1, the SRCm doesn't need the output data timing signal.

Before using the SRC function, be sure to specify the sampling rate through the SRCm IFS value setting register (see section 43.2.22, SRCm IFS Value Setting Register (SRCm_IFSVR)).

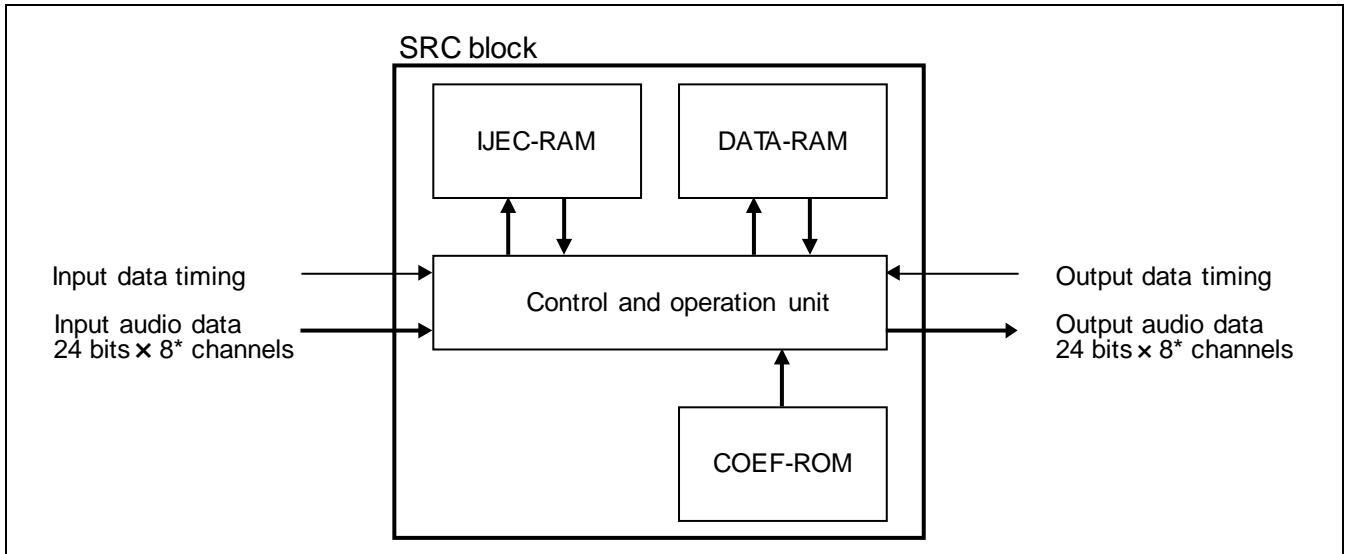

Figure 43.5 SRC Block Diagram

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] Table 43.6 shows the SRC functions.

Table 43.6 SRC Functions

| Item | | Performance | | | |
|--|--------------------|-----------------------------------|------------------|------------------|------------------|
| Type of SRC | | Asynchronous/ Synchronous SRC | | | |
| Channel number | | 1 or 2 | 4 | 6 | 8 |
| Sampling rate of input source | SRC0 | 8k to 192k [Hz] | 8k to 192k [Hz] | 8k to 192k [Hz] | 8k to 192k [Hz] |
| | SRC1, SRC3, SRC4 | 8k to 192k [Hz] | 8k to 192k [Hz] | 8k to 128k [Hz] | 8k to 96k [Hz] |
| | SRC2, SRC9 | 8k to 192k [Hz] | — | — | — |
| | SRC5 to SRC8 | 8k to 192k [Hz] | — | — | — |

| | SRC5 to SRC8 | -96 dB (for general-quality type) | | | |

Table 43.8 and 43.9 show the IJEC RAM and DATA RAM buffer size settings and the latencies.

Latency is different by setting of channel number.

Select the combination of settings BUFDATA[10:0] bits in SRCm_BSDSR/ SRCn_BSDSR register and IJECSIZE[8:0] bits in SRCm_BSISR register from Table 43.8 and 43.9. Operation cannot be guaranteed if the register is not set as specified combination.

Output delay depends on FSO/FSI ratio and it is calculated from following formula.

Output delay [Output sample] = (Processing delay) × (FSO/FSI ratio) + (Logic delay*)

*Logic delay = 3[Output sample]

Table 43.8 Combination of Register Setting Related to FSO/FSI Ratio and Channel, Latency
[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

| Item | Setting Range | | Register Setting | | | Latency (Example case calculated by formula) | | | | | | | | | | Note |
|--------------------|---------------|----------------|------------------|-----------------|---------------------------|---|------|------|-----|-----|-----|-----|-----|-----|-----|------|
| | FSO/FSI Ratio | Channel Number | IJEC SIZE [8:0] | BUF DATA [10:0] | Processing Delay [sample] | | | | | | | | | | | |

(1) Register Setting Procedure

The following describes the SRC register setting procedures. The register should be used according to the following procedures.

(a) SRC Processing Procedure

Figure 43.6 shows the processing procedure of SRC.

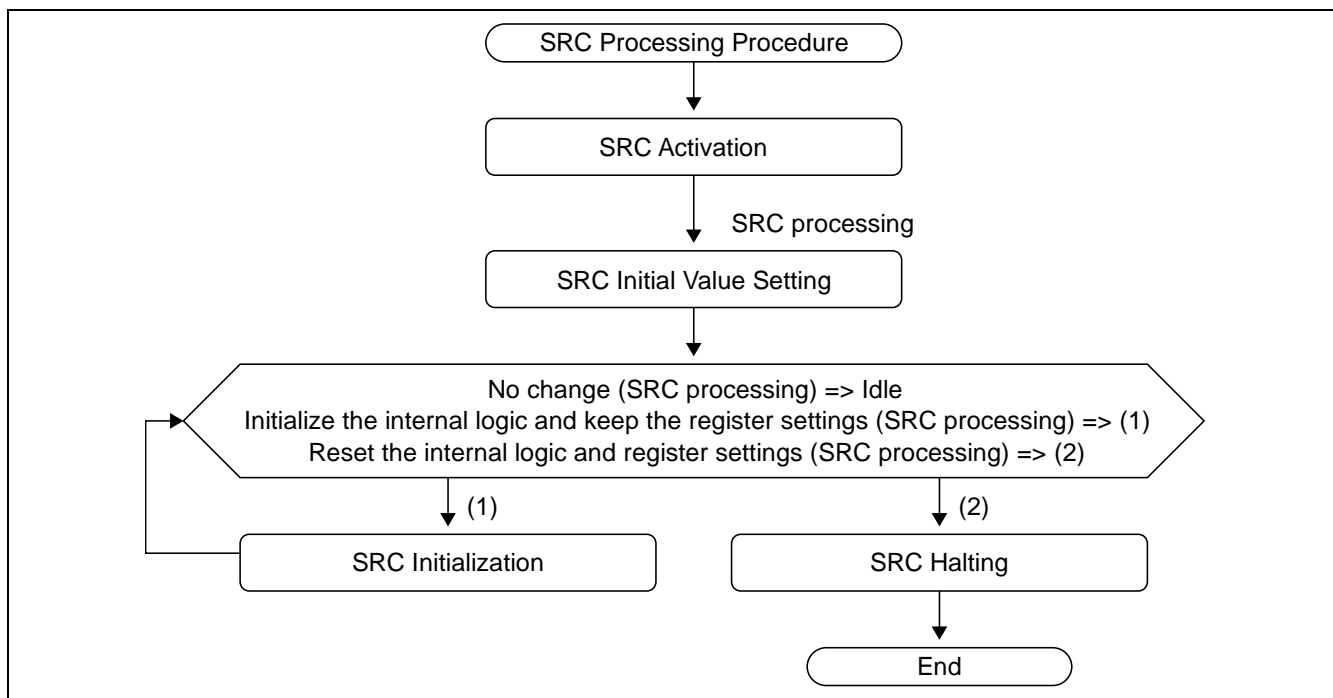

Figure 43.6 SRC Processing Procedure

(b) SRC Activation

Figure 43.7 shows the SRC activation flowchart. When the SRC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate SRC. When reset the SRC function, all registers are initialized. If the SRC function was initialized by a hardware reset, it doesn't need to initialize the SRC function by software reset.

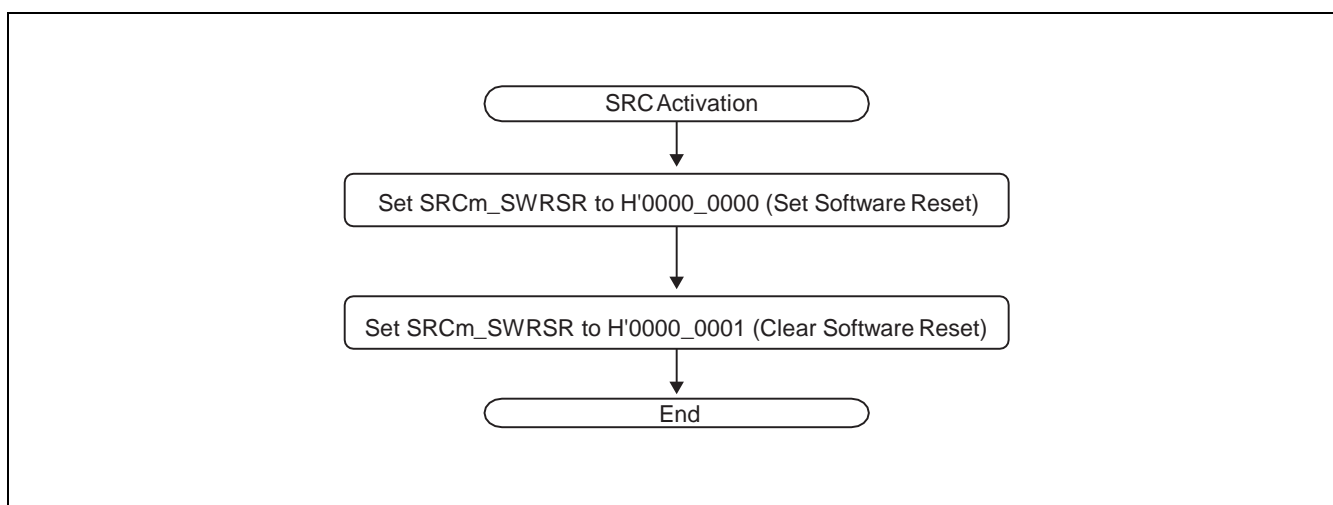

Figure 43.7 SRC Activation Flowchart

(c) SRC Initial Value Setting

Figure 43.8 shows the flowchart of the SRC initial value setting. Before operate SRC function, the initial values should be set.

Figure 43.8 SRC Initial Value Setting Flowchart

(d) SRC Initialization

Figure 43.9 shows the SRC initialization flowchart. SRCm_SRCIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP. And also it is necessary to provide the input and output timing signal.

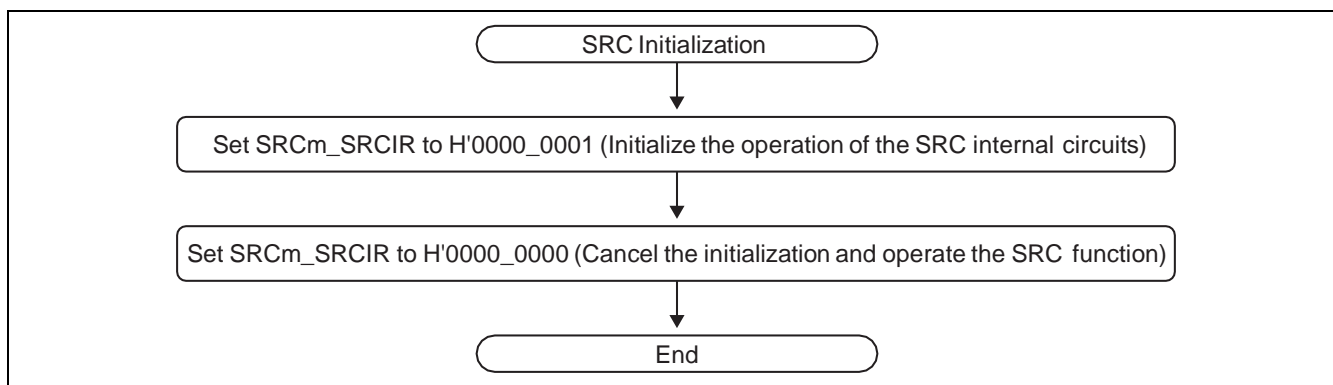

Figure 43.9 SRC Initialization Flowchart

(e) SRC Halting

Figure 43.10 shows the flowchart of SRC halting. When SRC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the SRC function, it is necessary to confirm the register settings and operation of peripheral IP.

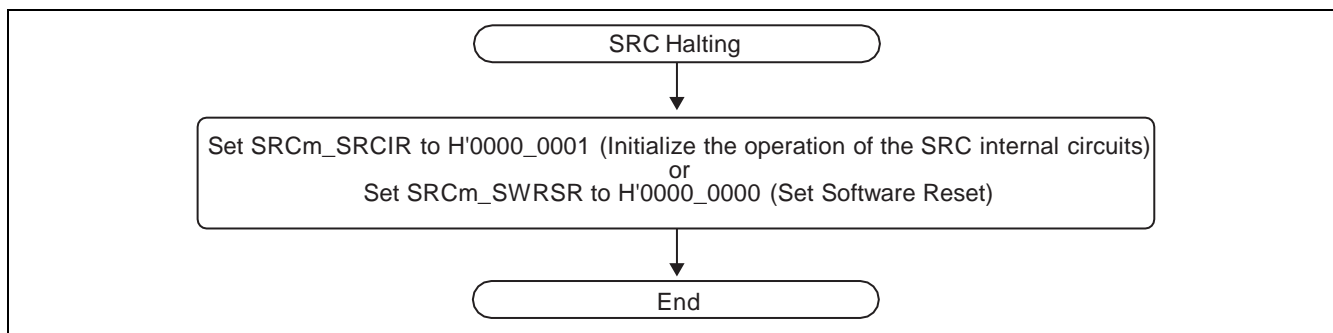

Figure 43.10 SRC Halting Flowchart

43.3.6 CMD Block

The CMD is a block for implementing the channel transfer unit (CTU block), mixing (MIX block), and digital volume and mute (DVC block) functions. Figure 43.11 shows the CMD block diagram.

The "Input audio data 0" to "Input audio data 3" in the figure indicate the data before the CMD function is applied. The "Output audio data" indicates the data after the CMD function is applied.

The "Output data timing" is a signal to show the sampling period for the output audio data. In addition, give the same signals to CMD output timing signal and output data timing signal used in the SRC.

Figure 43.11 CMD Block Diagram

43.3.7 Functional Blocks in CMD

(1) CTU Block

The CTU is a block for implementing channel transfer unit functions such as downmixing and splitter functions.

- Downmixing and splitter functions
 - Conversion of eight input channels into two output channels
 - Conversion of six input channels into two output channels
 - Conversion of two input channels into four sets of two output channels
 - Conversion of one input channel into eight sets of one output channel
 - No conversion

The settings of the Scale Value e00 to Scale Value e37 registers are calculated by using the following formula (signed bits are excluded):

$$\text{Setting (decimal)} = 10^X \times 4194304$$

$$X = (\text{value in dB}) / 20$$

(a) Register Setting Procedure

The following describes the CTU register setting procedures. The register should be used according to the following procedures.

- CTU Processing Procedure

Figure 43.12 shows the processing procedure of CTU.

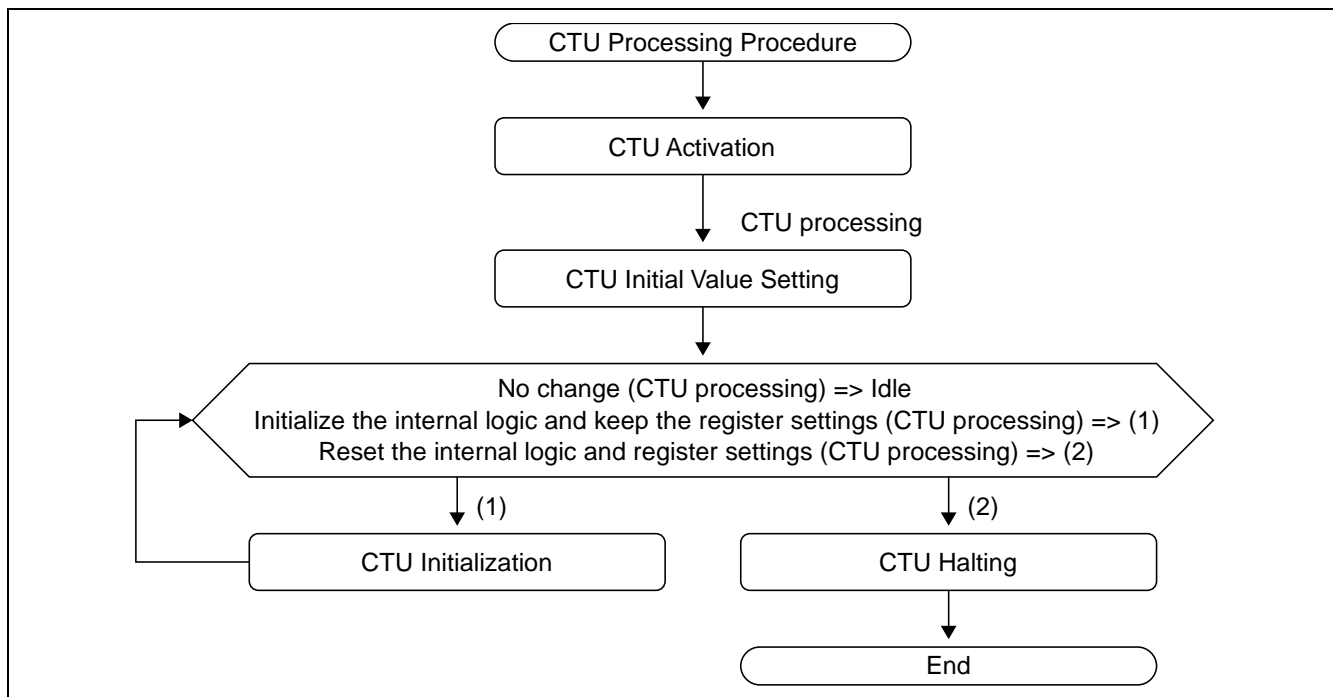

Figure 43.12 CTU Processing Procedure

- CTU Activation

Figure 43.13 shows the CTU activation flowchart. When the CTU is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate CTU. When reset the CTU function, all registers are initialized. If the CTU function was initialized by a hardware reset, it doesn't need to initialize the CTU function by software reset.

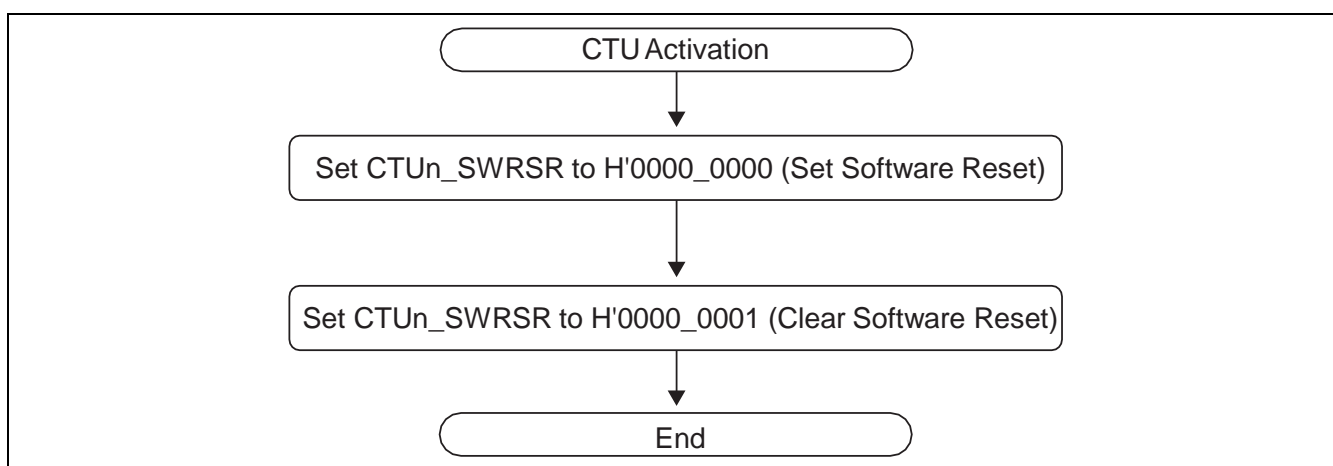

Figure 43.13 CTU Activation Flowchart

- CTU Initial Value Setting

Figure 43.14 shows the flowchart of the CTU initial value setting. Before operate CTU function, the initial values should be set. After set the register setting and cancel the initialization, CTU module starts the operation.

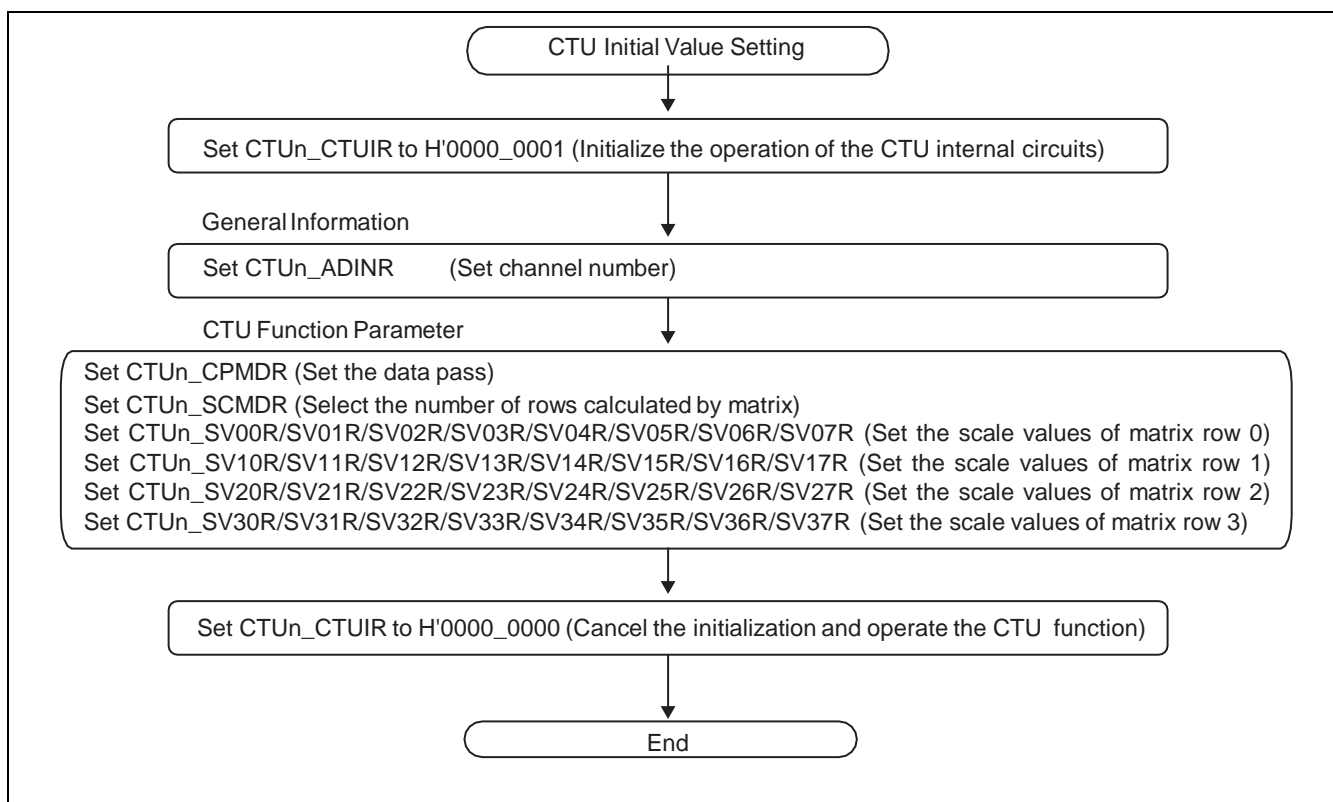

Figure 43.14 CTU Initial Value Setting Flowchart

- CTU Initialization

Figure 43.15 shows the CTU initialization flowchart. CTUn_CTUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

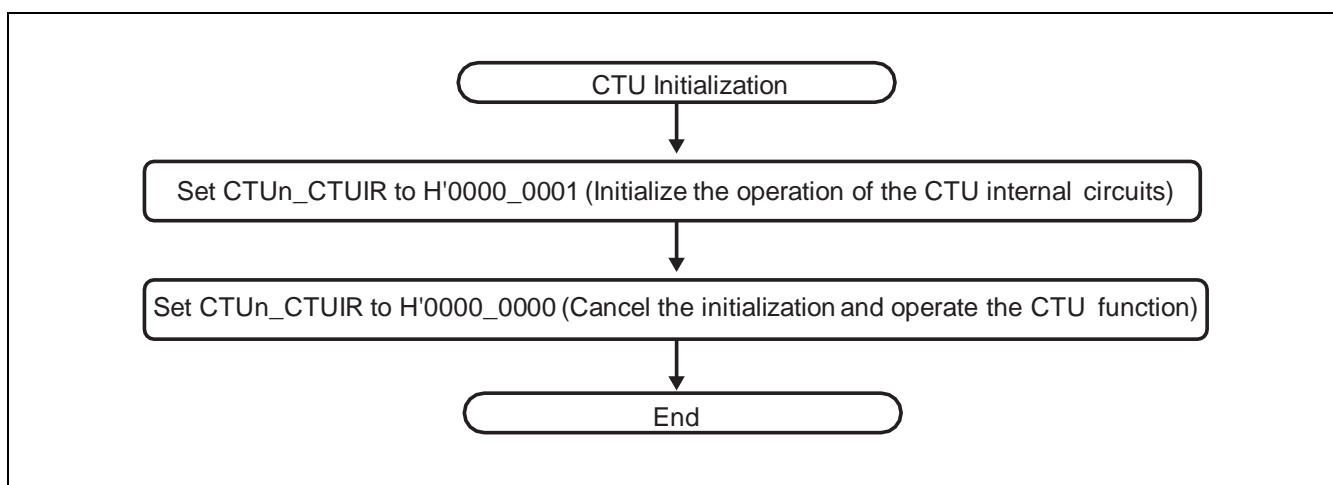

Figure 43.15 CTU Initialization Flowchart

- CTU Halting

Figure 43.16 shows the flowchart of CTU halting. When CTU is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the CTU function, it is necessary to confirm the register settings and operation of peripheral IP.

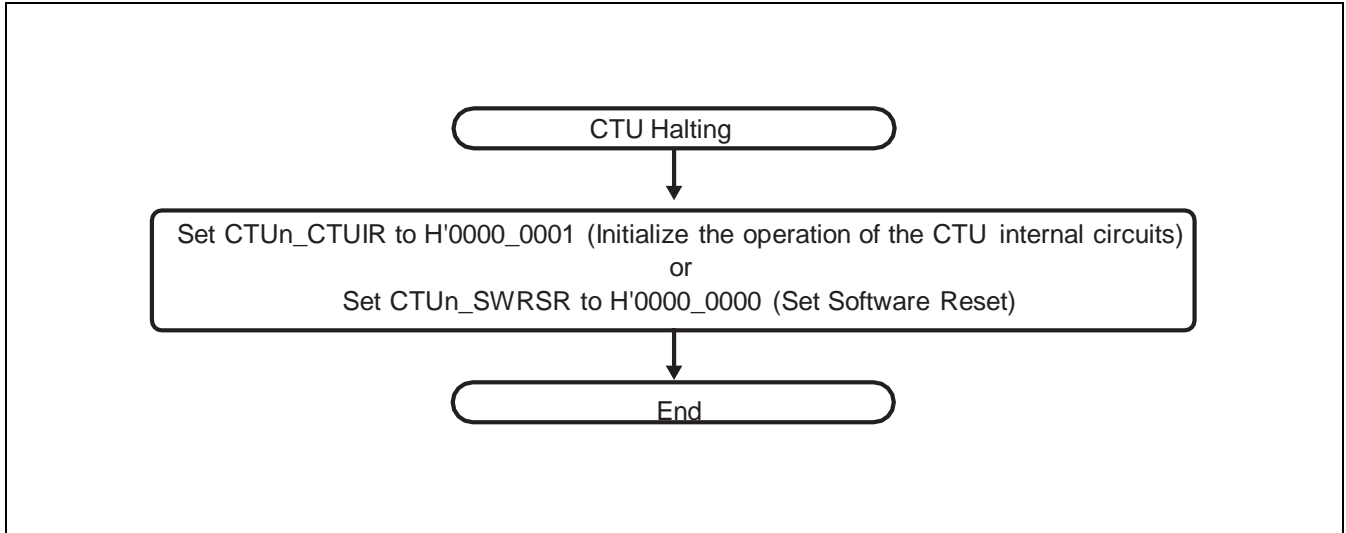

Figure 43.16 CTU Halting Flowchart

- CTU – Example

The channel conversion executes the linear transformation (matrix operation) as follows.

$$\begin{pmatrix} y_0 \\ y_1 \\ y_2 \\ y_3 \\ y_4 \\ y_5 \\ y_6 \\ y_7 \end{pmatrix} = \begin{pmatrix} e_{00} & e_{01} & e_{02} & e_{03} & e_{04} & e_{05} & e_{06} & e_{07} \\ e_{10} & e_{11} & e_{12} & e_{13} & e_{14} & e_{15} & e_{16} & e_{17} \\ e_{20} & e_{21} & e_{22} & e_{23} & e_{24} & e_{25} & e_{26} & e_{27} \\ e_{30} & e_{31} & e_{32} & e_{33} & e_{34} & e_{35} & e_{36} & e_{37} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{pmatrix} \times \begin{pmatrix} x_0 \\ x_1 \\ x_2 \\ x_3 \\ x_4 \\ x_5 \\ x_6 \\ x_7 \end{pmatrix}$$

x_i : Input data of channel i ($i = 0$ to 7)

y_i : Output data of channel i ($i = 0$ to 7)

e_j : CTUn_SVjR.SVEj ($j = 00, 01, 02, 03, 04, 05, 06, 07, 10, 11, 12, 13, 14, 15, 16, 17, 20, 21, 22, 23, 24, 25, 26, 27, 30, 31, 32, 33, 34, 35, 36, 37$)

Figure 43.17 shows 2 channels fold-down.

Figure 43.17 2 channels fold-down (Lt/Rt Downmix)

(2) MIX Block

The MIX block is for mixing (adding) streams from two to four audio data sources into a single stream.

- Ratio for adding sources is selectable
- Ratio is dynamically changeable
- Mixing with volume ramp is available (ramp period is selectable)

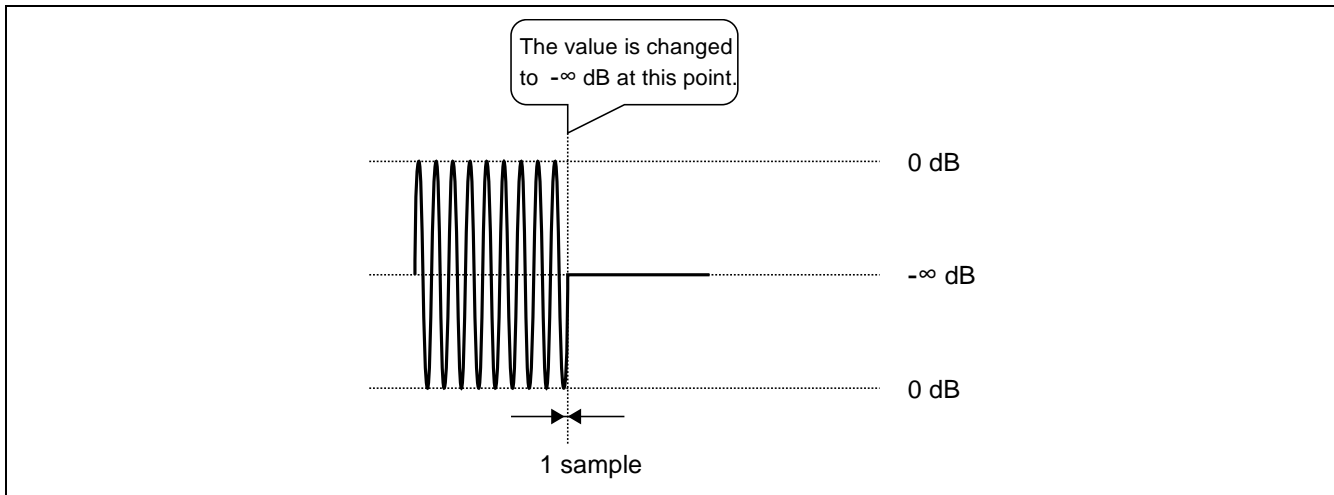

Figure 43.18 Step Processing

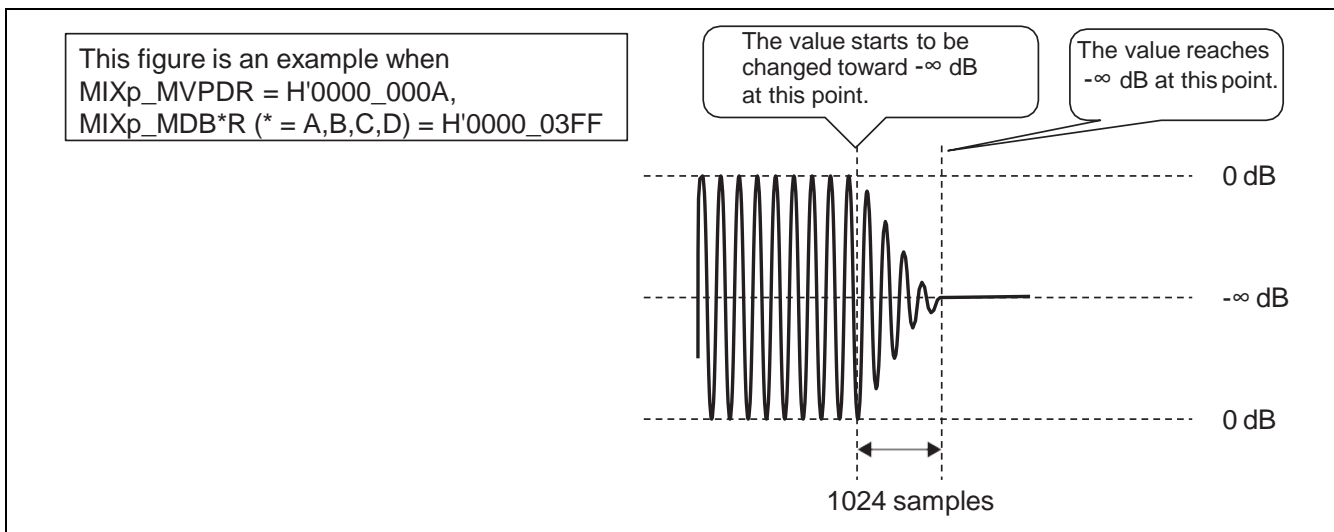

Figure 43.19 Ramp Processing

Table 43.11 to Table 43.14 show the settings of the MIX decibel register and the corresponding levels in decibels.

Table 43.11 Settings of MIXp_MDBAR, MIXp_MDBBR, MIXp_MDBCR, and MIXp_MDBDR and Corresponding Values in Decibels (No. 0 to 255)

| No | Value (HEX) | dB | No | Value (HEX) | dB | No | Value (HEX) | dB | No | Value (HEX) | dB |
|----|-------------|--------|----|-------------|--------|-----|-------------|---------|-----|-------------|---------|
| 0 | 000 | 0 | 39 | 027 | -4.875 | 78 | 04E | -9.75 | 117 | 075 | -14.625 |

(a) Register Setting Procedure

The following describes the MIX register setting procedures. The register should be used according to the following procedures.

- MIX Processing Procedure

Figure 43.20 shows the processing procedure of MIX.

Figure 43.20 MIX Processing Procedure

- MIX Activation

Figure 43.21 shows the MIX activation flowchart. When the MIX is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate MIX. When reset the MIX function, all registers are initialized. If the MIX function was initialized by a hardware reset, it doesn't need to initialize the MIX function by software reset.

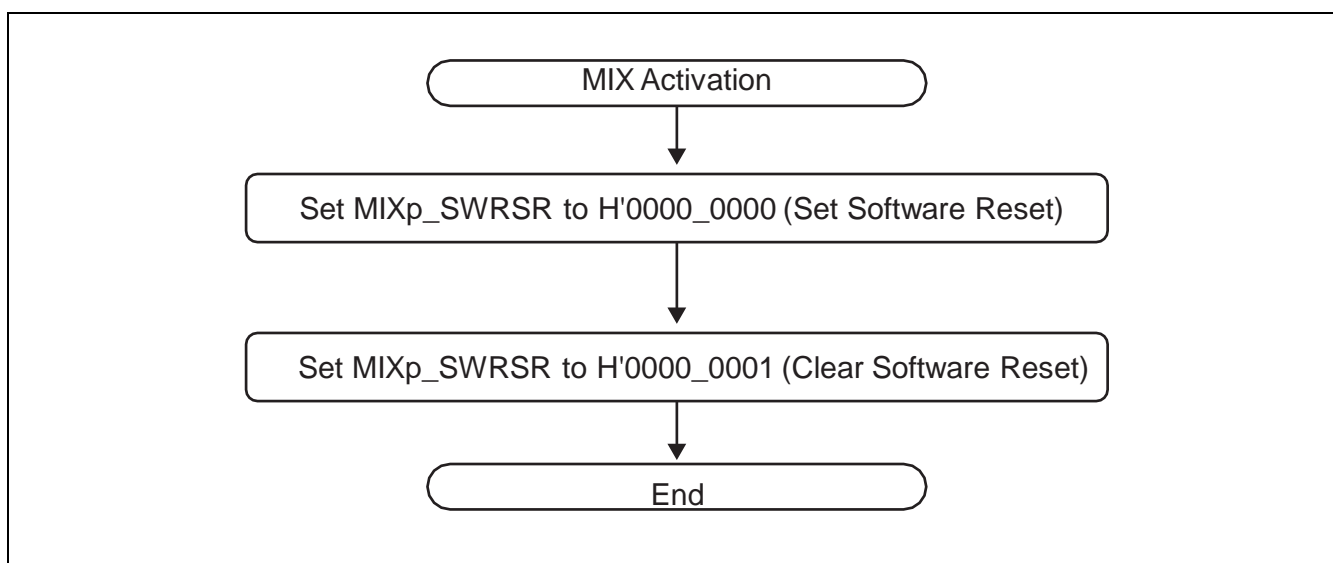

Figure 43.21 MIX Activation Flowchart

• MIX Initial Value Setting

Figure 43.22 shows the flowchart of the MIX initial value setting. Before operate MIX function, the initial values should be set. After set the register setting and cancel the initialization, MIX module changes the volume of each system by volume step to the dB value of MIXp_MDBAR and MIXp_MDBBR and MIXp_MDBCR and MIXp_MDBDR regardless of MIXp_MIXMR setting.

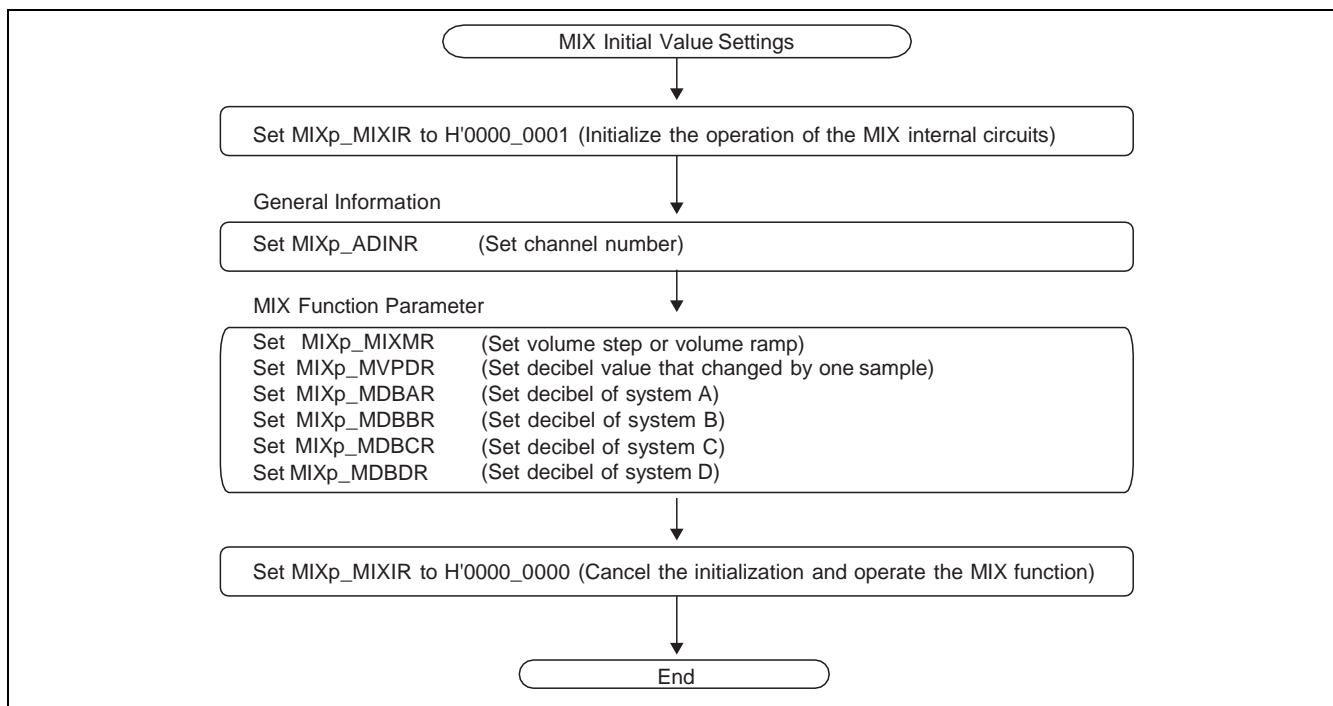

Figure 43.22 MIX Initial Value Setting Flowchart

• MIX Processing Parameter

Figure 43.23 shows the MIX processing parameter flowchart. Before change the parameter of decibel for each system, the setting of the MIXp_MDBER should be disables. After that set the decibels of MIXp_MDBAR and MIXp_MDBBR and MIXp_MDBCR and MIXp_MDBDR and enables the MIXp_MDBER for reflect the decibel setting to the MIX processing.

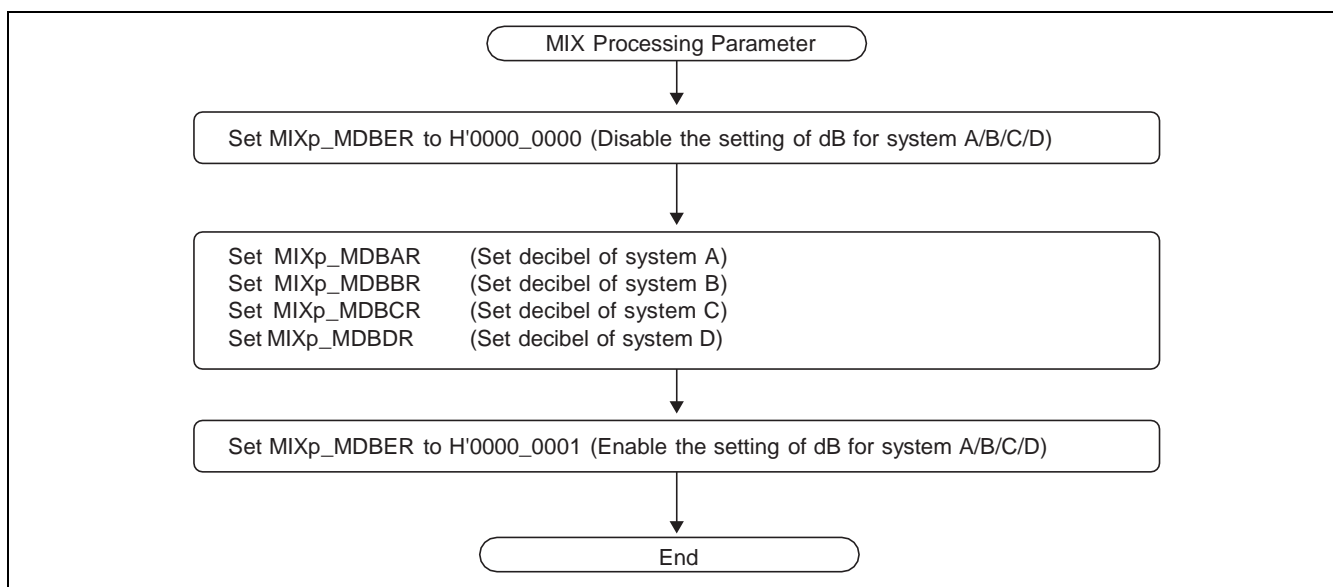

Figure 43.23 MIX Processing Parameter Flowchart

- MIX Initialization

Figure 43.24 shows the MIX initialization flowchart. MIXp_MIXIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

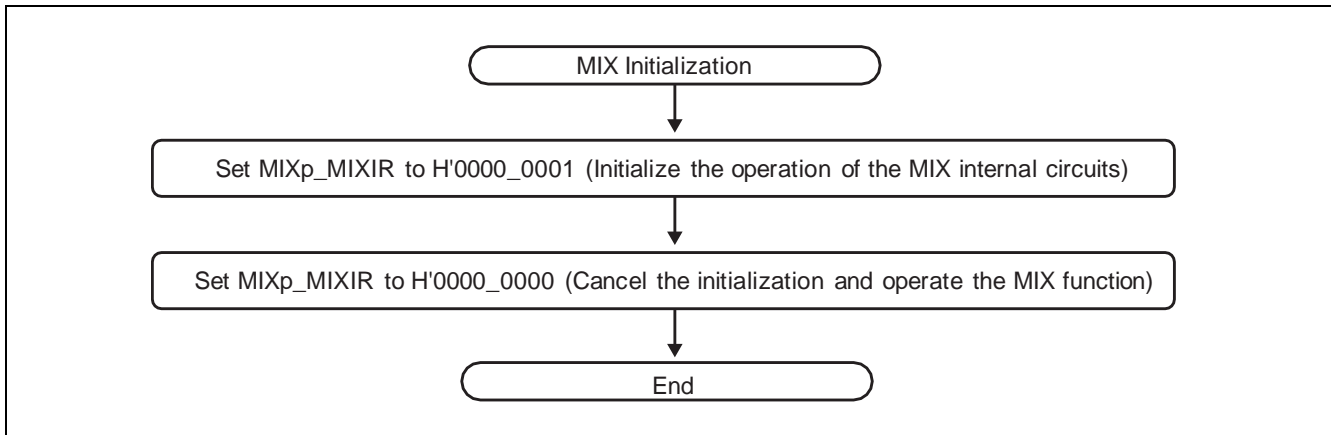

Figure 43.24 MIX Initialization Flowchart

- MIX Halting

Figure 43.25 shows the flowchart of MIX halting. When MIX is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the MIX function, it is necessary to confirm the register settings and operation of peripheral IP.

Figure 43.25 MIX Halting Flowchart

(3) DVC Block

The DVC is a block for implementing the volume and mute functions.

- Volume control function including digital volume, volume ramp, and zero-crossing mute
- The digital volume function is specified by a 24-bit fixed-point value within the range from 0 to 8 times (mute or -120 to 18 dB)
- The volume ramp function can be used for soft mute, fade-in, fade-out, or desired volume adjustment
- The volume ramp period can be changed within the sampling range from the 0th to 23rd power of 2
- The zero-crossing mute function silences the sound at the zero-crossing point of the audio data

Table 43.15 shows the DVC functions.

Table 43.15 DVC Functions

| Item | Performance |
|--------------------|--|
| Digital volume | Range: -120 dB to 18 dB (9.5×10^{-7} times to 8 times) |
| Volume ramp | Volume ramp is used for many kinds of operation (soft mute, fade-in, fade-out, and volume adjustment by ramp) Ramp period: $2^0/f_{so}$ to $2^{23}/f_{so}$ Examples: ($1/f_{so}$: -128 dB/1 step) ($2/f_{so}$: -64 dB/1 step) ($4/f_{so}$: -32 dB/1 step) : ($128/f_{so}$: -1 dB/1 step) ($256/f_{so}$: -0.5 dB/1 step) ($512/f_{so}$: -0.25 dB/1 step) ($1024/f_{so}$: -0.125 dB/1 step) ($2048/f_{so}$: -0.125 dB/2 steps) ($4096/f_{so}$: -0.125 dB/4 steps) : ($8388608/f_{so}$: -0.125 dB/8192 steps) |
| Zero-crossing mute | Mute the signal at zero-crossing point |

The settings and corresponding values for the volume ramp are the same as those listed in Table 43.11 to Table 43.14.

The settings and corresponding values for the digital volume are calculated by using the following formula:

$$\text{Setting (decimal)} = 10^X \times 1048576$$

$$X = (\text{value in dB}) / 20$$

(a) Register Setting Procedure

The following describes the DVC register setting procedures. The register should be used according to the following procedures.

- DVC Processing Procedure

Figure 43.26 shows the processing procedure of DVC.

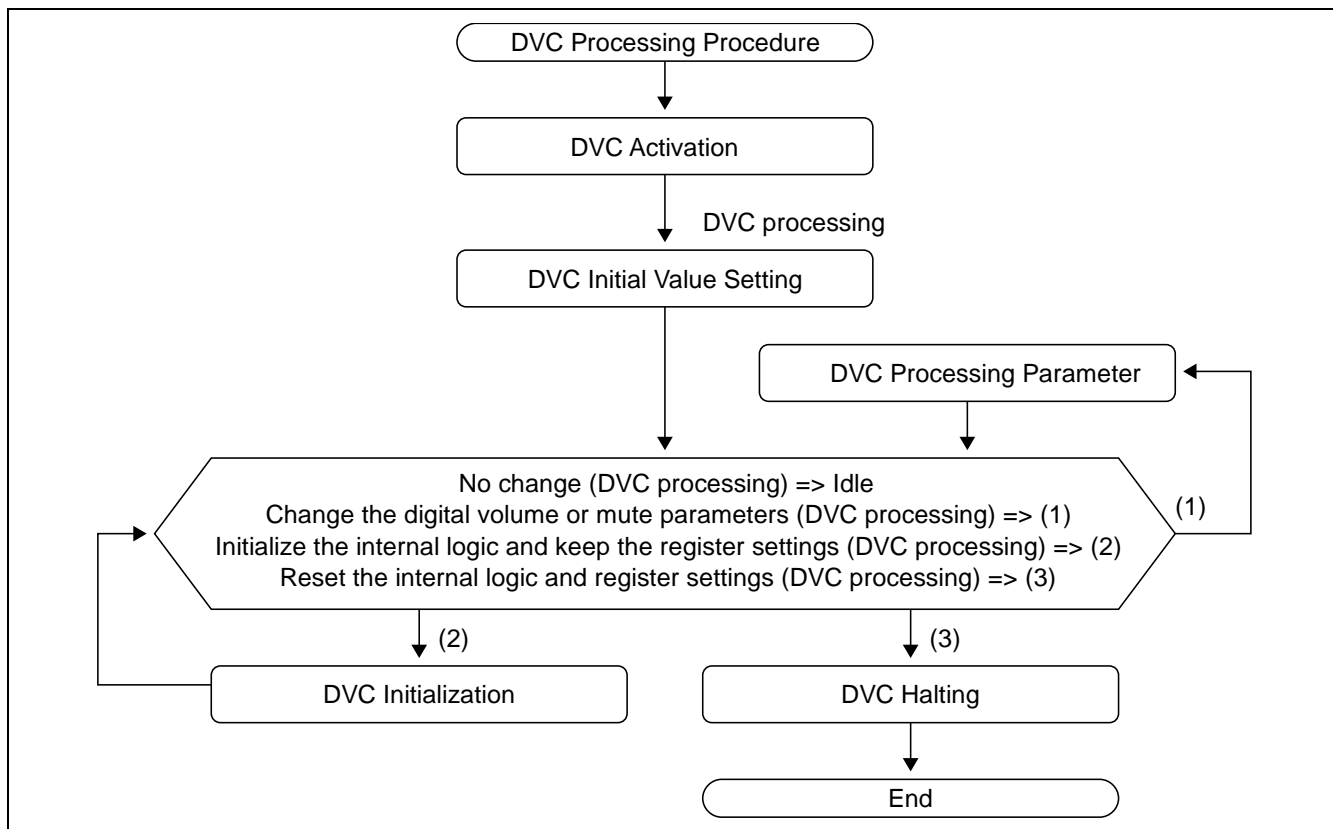

Figure 43.26 DVC Processing Procedure

- DVC Activation

Figure 43.27 shows the DVC activation flowchart. When the DVC is activated, a software reset should be set to initialize logic and register setting. Then, the software reset should be cleared and ready to operate DVC. When reset the DVC function, all registers are initialized. If the DVC function was initialized by a hardware reset, it doesn't need to initialize the DVC function by software reset.

Figure 43.27 DVC Activation Flowchart

- DVC Initial Value Setting

Figure 43.28 shows the flowchart of the DVC initial value setting. Before operate DVC function, the initial values should be set.

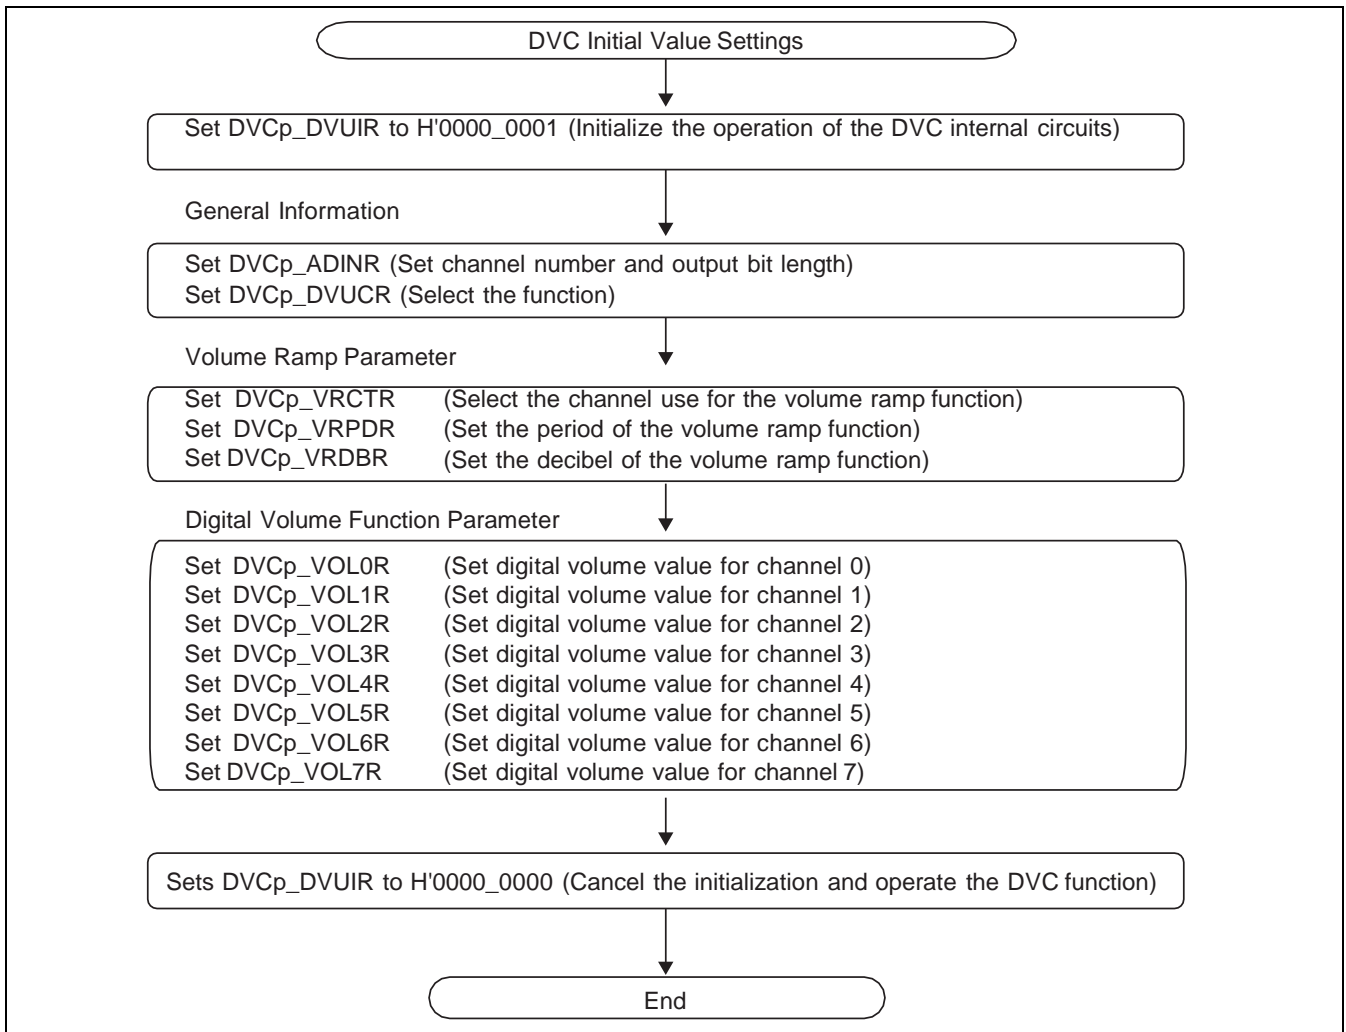

Figure 43.28 DVC Initial Value Setting Flowchart

- DVC Processing Parameter

Figure 43.29 shows the DVC processing parameter flowchart. When DVC is processing, user can control the zero cross mute and the volume ramp and the digital volume value or by changing the setting value of registers. Before change the parameter of each function, the setting of DVCp_DVUER should be disables. After that set the setting of each function and enables the DVCp_DVUER for reflect the register setting to the DVC processing.

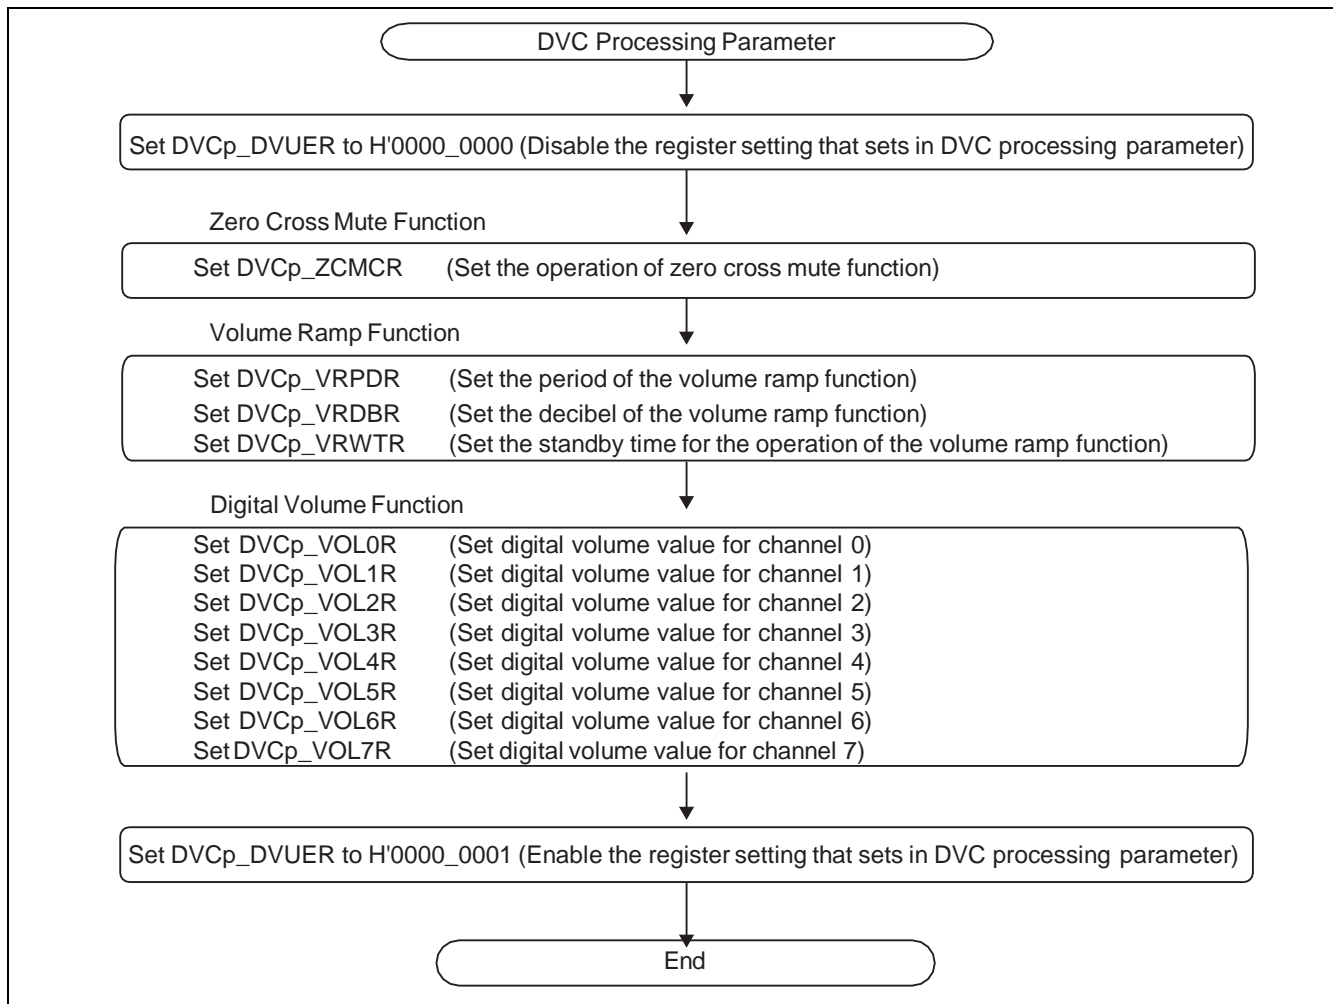

Figure 43.29 DVC Processing Parameter Flowchart

- DVC Initialization

Figure 43.30 shows the flowchart of DVC Initialization. DVCp_DVUIR register doesn't initialize the register settings and these values are maintained. Before cancel the initialization, it is necessary to set or check the register settings of peripheral IP.

Figure 43.30 DVC Initialization Flowchart

- DVC Halting

Figure 43.31 shows the flowchart of DVC halting. When DVC is halting, it should be initialize or reset by software reset or hardware reset. Before initialize or reset the DVC function, it is necessary to confirm the register settings and operation of peripheral IP.

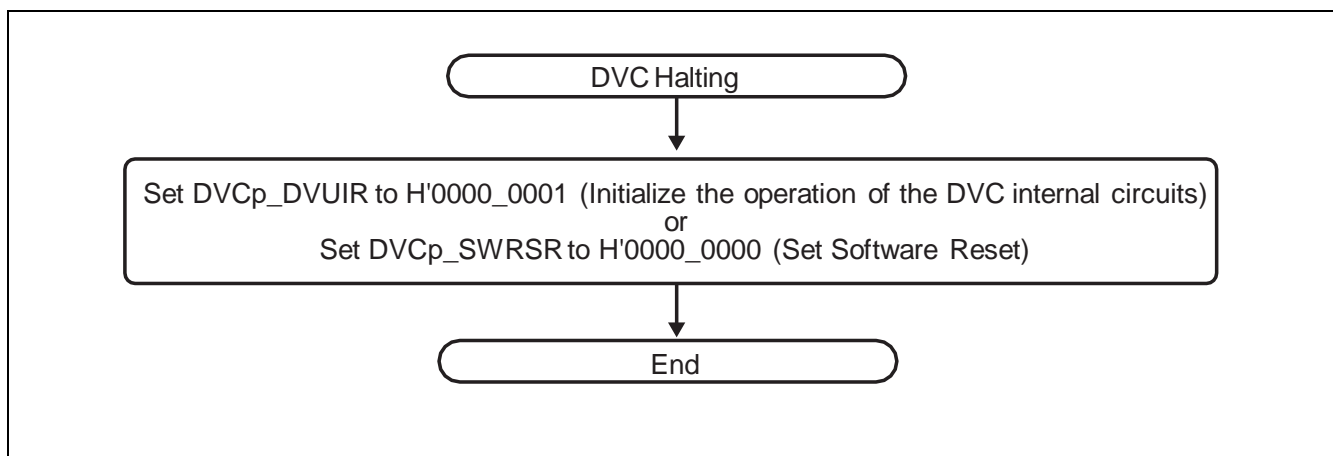

Figure 43.31 DVC Halting Flowchart

43.3.8 Input Data Timing and Output Data Timing

When using the SRC or CMD, the input data timing and output data timing should be specified. For details of the settings, refer to section 42, Audio Clock Generator (ADG).

43.4 Usage Notes

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

43.4.1 Notes on Fixed Value related to SCU registers

The fixed value is needed for these bits in the SCU registers.

It is necessary to change from the initial value to the specific fixed value for the bits of the registers on Table 43.17.

Setting other value is prohibited.

Table 43.16 Fixed Value for the SCU Registers without any condition

| Section | Bit Number | Fixed Value |
|--|------------|--|
| 43.2.23 SRCm SRC Control Register | 16 | B'1 |
| | 12 | B'1 |
| | 8 | B'1 |
| | 4 | B'1 |
| 43.2.21 SRCm IFS Control Register | 0 | B'1 |
| 43.2.22 SRCm IFS Value Setting Register | 27 to 0 | The value of FSI should be calculated into them. A calculate method can be found in that section. |
| 43.2.24 SRCm Buffer Size DATA RAM Setting Register | 26 to 16 | Depends on your needs. * |
| 43.2.25 SRCn Buffer Size DATA RAM Setting Register | 26 to 16 | Depends on your needs. * |
| 43.2.26 SRCm Buffer Size IJEC RAM Setting Register | 21 to 16 | H'10 |
| | 8 to 0 | Depends on your needs. * |

Note: * The fixed value depends on your needs. Refer to the explanation in those section or related table.

Table 43.17 Fixed Value for the SCU Registers with some condition

| Section | Bit Number | Fixed Value | Condition |
|---|------------|-------------|---|
| 43.2.5 SRCm Control Register | 4 | B'0 | A condition is described in a note of that section. Refer to that note. |
| 43.2.21 SRCm IFS Control Register | 23 to 20 | H'2 | Only when fast_ijk_en = 1, as bit 31 |
| | 19 to 16 | H'4 | Only when fast_ijk_en = 1, as bit 31 |
| 43.2.80 DVCp Volume Ramp Control Register | 7 to 0 | H'FF | VRMD bit of DVCp_DVUCR register is 1. |

43.4.2 Note on generation and selection of timing signal

For details on generation and selection of timing signals, see section 42. Audio Clock Generator (ADG).

44. Direct Memory Access Controller for Audio (Audio-DMAC)

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

44.1 Overview

This LSI includes a direct memory access controller for audio (audio-DMAC). The audio-DMAC can be used in place of the CPU to handle high-speed data transfer to and from an external memory, the on-chip memory, memory-mapped external devices, or on-chip peripheral modules.

44.1.1 Features

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Up to 32 channels are available.

[RZ/G2E]

- Up to 16 channels are available.

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E]

- 1-T byte physical address space
- Transfer data length: Byte, word (2 bytes), long-word (4 bytes), 8 bytes, 16 bytes, 32 bytes, and 64 bytes
- Maximum number of transfer times: 16,777,215
- Address mode: Dual address mode
- Transfer requests:

Requests from on-chip peripheral modules or auto requests can be selected. The following modules can issue on-chip peripheral module requests.

SSI0 to SSI9, SCU0 to SCU9

- Selectable bus modes:
Normal speed mode or slow mode can be selected for each channel.
- Either fixed priority or round-robin arbitration can be selected for use in arbitration among the transfer channels.
- Interrupt request:

The audio-DMAC can be set up to generate an interrupt request for the CPU upon completion of transfer under the control of one stage of the descriptor memory, at the end of the data transfer, in response to an MMU error, and in response to an address error.

- Descriptor memory function:

Up to 128 sets of the settings for the source address register, destination address register, and transfer count register are available (if use of the descriptor memory is only enabled for one channel) for use in setting up consecutive DMA transfers (the memory can hold register values for up to 256 stages of transfer when the external memory is selected). An infinite repeat mode is also available.

Figure 44.1 shows the block diagram of the audio-DMAC.

Figure 44.1 Block Diagram of the Audio-DMAC

44.1.2 External Pins

There are no external pins relevant to the audio-DMAC.

44.1.3 Register Configuration

Table 44.1 lists the registers of the audio-DMAC. Table 44.2 shows the register states of the audio-DMAC in each operating mode.

Note: The number of the audio-DMAC channels and the registers in use depend on the product:
 32 channels for the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0 (registers for both the higher- and lower-numbered sets of channels 0 to 15 and 16 to 31 are in use)

Table 44.1 Register Configuration of the Audio-DMAC

| Secure function Secure Status register (for channels 16 to 31) | DMASES_U | R/W | H'EC72_00C0 | 32 | √ | √ | √ | — |
| Secure function Slave Error Address register (for channels 16 to 31) | DMASEDDR_U | R | H'EC72_00C4 | 32 | √ | √ | √ | — |
| Secure function Error Master ID register (for channels 16 to 31) | DMASEMID_U | R | H'EC72_00C8 | 32 | √ | √ | √ | — |

Note: For RZ/G Gen2, the base address of registers for the lower-numbered channels (0 to 15) is H'EC70_0000.

For RZ/G Gen2, the base address of registers for the higher-numbered channels (16 to 31) is H'EC72_0000.

* This address is used in total size transmission (see section 44.3.6, Total Size Transmission).

Table 44.2 States of Audio-DMAC Registers in each Operating Mode

| Abbreviation | Power-On Reset | Module Standby |
|-----------------------------------|----------------|----------------|
| DMAISTA_L/ DMAISTA_U | Initialized | Retained |
| DMASEC_L/ DMASEC_H | Initialized | Retained |
| DMAOR_L/ DMAOR_U | Initialized | Retained |
| DMACHCLR_L/ DMACHCLR_U | Initialized | Retained |
| DMADPSEC_L/ DMADPSEC_U | Initialized | Retained |
| DMASAR_0 to DMASAR_31 | Initialized | Retained |
| DMADAR_0 to DMADAR_31 | Initialized | Retained |
| DMATCR_0 to DMATCR_31 | Initialized | Retained |
| DMATSR_0 to DMATSR_31 | Initialized | Retained |
| DMACHCR_0 to DMACHCR_31 | Initialized | Retained |
| DMATCRB_0 DMATCRB_31 | Initialized | Retained |
| DMATSRB_0 to DMATSRB_31 | Initialized | Retained |
| DMACHCRB_0 to DMACHCRB_31 | Initialized | Retained |
| DMABUFCR_0 to DMABUFCR_31 | Initialized | Retained |
| DMARS_0 to DMARS_31 | Initialized | Retained |
| DMADPBASE_0 to DMADPBASE_31 | Initialized | Retained |
| DMADPCR_0 DMADPCR_31 | Initialized | Retained |
| DMAFIXSAR_0 to DMAFIXSAR_31 | Initialized | Retained |
| DMAFIXDAR_0 to DMAFIXDAR_31 | Initialized | Retained |
| DMAFIXDPBASE_0 to DMAFIXDPBASE_31 | Initialized | Retained |
| DescriptorMEM | Undefined | Retained |
| DMASES_L/ DMASES_U | Initialized | Retained |
| DMASEDDR_L/ DMASEDDR_U | Initialized | Retained |
| DMASEMID_L/ DMASEMID_U | Initialized | Retained |

44.1.4 Connected Modules

Table 44.3 shows the connected modules to Audio-DMAC. As for the feature of the connected modules, refer to the chapter of each modules.

Table 44.3 Connected Modules

| Module name | Connected module name | Function of connected module |
|--|-----------------------|--|
| Direct Memory Access Controller for Audio (Audio-DMAC) | CPG | Output clocks |
| | Module Standby | Control to stop clocks |
| | Software Reset | Execute software reset |
| | INTC-SYS | Control to interrupt |
| | IPMMU | UTLB function |
| | Audio AXI Main Bus | MEM I/F-128bit, BUS I/F-64bit connection |
| | Audio AXI DMAC Bus | PERI I/F-64bit connection |
| | D-REQ synchronous | DMA request and RACK handshake |

44.2 Register Description

44.2.1 DMA Interrupt Status Register for Lower-Numbered Channels (DMAISTA_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMAISTA_L is a 32-bit readable register that indicates the states of the interrupt signals for each of the lower-numbered channels.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|

44.2.3 DMA Secure Control Register for Lower-Numbered Channels (DMASEC_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMASEC_L is a 32-bit readable/writable register that controls the security attribute of each of the lower-numbered channels. Only the initiator in the secure mode can change the setting of this register.

Only secure access is allowed to registers of channels with the secure mode setting. The following registers are protected by the secure mode.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFGR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

| | | | | | | | | | | | | | | | | |

44.2.5 DMA Operation Register for Lower-Numbered Channels (DMAOR_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMAOR_L is a 16-bit readable/writable register that enables DMA transfer on all lower-numbered channels and specifies the method used to determine the priority levels for all lower-numbered DMA channels. This register also indicates address errors.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---------|-----|---|---|---|---|---|--------|---|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | PR[1:0] | — | — | — | — | — | — | AE | — | DME |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R/(W)* | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|----------|----------|---------------|--------|---|
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | PR[1:0] | B'00 | R/W | Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. B'00: Fixed CH0 > CH1 > ... > CH11 > CH15 B'11: Round-robin priority Other than above: Setting prohibited |
| 7 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 | AE | B'0 | R/(W)* | Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer. |
| 1 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|-----|----------|---------------|-----|---|
| 0 | DME | B'0 | R/W | <p>DMA Master Enable</p> <p>Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_L must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels.</p> <p>0: Disables DMA transfers on all channels 1: Enables DMA transfers on all channels</p> |

Note: * Writing 0 is possible to clear the flag.

44.2.6 DMA Operation Register for Higher-Numbered Channels (DMAOR_U)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

DMAOR_U is a 16-bit readable/writable register that enables DMA transfer on all higher-numbered channels and specifies the method used to determine the priority levels for all higher-numbered DMA channels. This register also indicates address errors.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---------|-----|---|---|---|---|---|--------|---|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | PR[1:0] | — | — | — | — | — | — | AE | — | DME |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R/(W)* | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|----------|----------|---------------|--------|---|
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9, 8 | PR[1:0] | B'00 | R/W | Priority Mode Select the method for setting the order of priority of channels when transfer requests for multiple channels arrive simultaneously. B'00: Fixed CH16 > CH17 > ... > CH30 > CH31 [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] B'11: Round-robin priority Other than above: Setting prohibited |
| 7 to 3 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 2 | AE | B'0 | R/(W)* | Address Error Flag Indicates that an address error interrupt occurred during DMA transfer. This bit is set under the following conditions: The value set in DMASAR or DMADAR does not fall on a boundary corresponding to the transfer size. The source or destination for transfer is in an invalid space. The source or destination for transfer is in module stop mode. If this bit is set, DMA transfer through the channel is not possible even if the DE bit is set to 1. To clear the AE bit, write 0 to the AE bit after reading 1 from it or clear the CAE bit for each channel for which it is set. Clearing the AE bit clears the channel address error bits for all channels. 0: An audio-DMAC address error interrupt is not present. [Clearing condition] Writing CAE = 0 after reading CAE = 1 1: An audio-DMAC address error interrupt being generated during DMA transfer. |
| 1 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|-----|----------|---------------|-----|--|
| 0 | DME | B'0 | R/W | <p>DMA Master Enable</p> <p>Enables or disables DMA transfer on all channels. If the DME bit and the DE bit in DMACHCR are both set to 1, DMA transfer is enabled. At this time all AE bits in DMAOR_U must have the value 0. For DMA transfer on a channel to then proceed, the TE bit in DMACHCR for the channel must also have the value 0. Clearing this bit during transfer aborts transfer on all channels.</p> <p>0: Disables DMA transfers on all channels</p> <p>1: Enables DMA transfers on all channels</p> |

44.2.7 DMA Channel Clear Register for Lower-Numbered Channels (DMACHCLR_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMACHCLR_L is a 32-bit writable register that initializes each of the lower-numbered channels.

When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFGR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

| | | | | | | | | | | | | | | | | |
|----------------|-----------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | CLR[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | CLR[15:0] | All 0 | W | Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[0] 0: Ignored 1: All registers for channel 0 are cleared. CLR[1] 0: Ignored 1: All registers for channel 1 are cleared. CLR[2] 0: Ignored 1: All registers for channel 2 are cleared. ... CLR[12] 0: Ignored 1: All registers for channel 12 are cleared. CLR[13] 0: Ignored 1: All registers for channel 13 are cleared. CLR[14] 0: Ignored 1: All registers for channel 14 are cleared. CLR[15] 0: Ignored 1: All registers for channel 15 are cleared. |

When writing to this register, confirm that the DE bit is set to 0.

44.2.8 DMA Channel Clear Register for Higher-Numbered Channels (DMACHCLR_U)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

DMACHCLR_U is a 32-bit writable register that initializes each of the higher-numbered channels. When a bit of this register is set, the state of the corresponding channel is completely initialized.

This includes initialization of the following registers.

DMASAR, DMADAR, DMATCR, DMATSR, DMACHCR, DMATCRB, DMATSRB, DMACHCRB, DMARS, DMABUFGR, DMADPBASE, DMADPCR, DMAFIXSAR, DMAFIXDAR, and DMAFIXDPBASE

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 15 to 0 | CLR[31:16] | All 0 | W | Writing to a bit leads to clearing of all registers for the corresponding channel. CLR[16] 0: Ignored 1: All registers for channel 16 are cleared. CLR[17] 0: Ignored 1: All registers for channel 17 are cleared. ... CLR[25] 0: Ignored 1: All registers for channel 25 are cleared. CLR[26] 0: Ignored 1: All registers for channel 26 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[27] 0: Ignored 1: All registers for channel 27 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[28] 0: Ignored 1: All registers for channel 28 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[29] 0: Ignored 1: All registers for channel 29 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[30] 0: Ignored 1: All registers for channel 30 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] CLR[31] 0: Ignored 1: All registers for channel 31 are cleared. [in the RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] When writing to this register, confirm that the DE bit is set to 0. |

44.2.9 DPRAM Secure Control Register for Lower-Numbered Channels (DMADPSEC_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMADPSEC_L is a 32-bit readable/writable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

| | | | | | | | | | | | | | | | | |
|----------------|-----|----|----|----|----|----|----|---------|-----|-----|-----|-----|-----|-----|-----|-----|

| 24 to 16 | SA[8:0] | H'000 | R/W | Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 to 0 | SM[8:0] | H'000 | R/W | Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 44.4. |

44.2.10 DPRAM Secure Control Register for Higher-Numbered Channels (DMADPSEC_U)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

DMADPSEC_U is a 32-bit readable/writable register that controls the security attribute of the descriptor memory. Only the initiator in the secure mode can change the setting of this register.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 | SEC | B'0 | R/W | Security Attribute Setting for Descriptor Memory Specifies the security attribute of the address space used for the descriptor memory. 0: Non-secure 1: Secure |
| 30 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 to 16 | SA[8:0] | H'000 | R/W | Security Attribute Setting for Base Address of Descriptor Memory Specify the base address of the descriptor memory to be assigned the security attribute. H'000: H'A000 H'001: H'A004 ... H'1FF: H'A7FC |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 to 0 | SM[8:0] | H'000 | R/W | Security Attribute Setting for Base Address Mask of Descriptor Memory Specify the security attribute base address mask of the descriptor memory. The range of memory to be assigned the security attribute is specified by this register. See Figure 44.4. |

44.2.11 DMA Source Address Registers 0 to 31 (DMASAR_0 to DMASAR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMASAR is a 32-bit readable/writable register that specifies the source address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next source address.

When the address mode is incrementation, sources in memory only have byte boundaries. For details, refer to Table 44.4.

44.2.12 DMA Destination Address Registers 0 to 31 (DMADAR_0 to DMADAR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.
 RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
 RZ/G2E: 16 channels (channels 0 to 15)

DMADAR is 32-bit readable/writable register that specify the destination address of a DMA transfer. While a DMA transfer is in progress, this register indicates the next destination address. When the address mode is incremented, destinations in memory only have byte boundaries. For details, refer to Table 44.4.

Table 44.4 SAR/DAR Address Restriction

| Resource Selection | Address Mode | Restriction |
|--|----------------|---|
| Auto request | Incrementation | No restriction (byte boundaries) |
| | Others | Boundary corresponding to the DMA transfer size |
| On-chip peripheral module request Transmission/DAR, Reception/SAR | All | Boundary corresponding to the DMA transfer size |
| On-chip peripheral module request Transmission/SAR, Reception/DAR | Incrementation | No restriction (byte boundaries) |
| | Others | Boundary corresponding to the DMA transfer size |

44.2.13 DMA Transfer Count Registers 0 to 31 (DMATCR_0 to DMATCR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMATCR is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001 and 16,777,215 (the maximum) when the setting is H'00FF_FFFF. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in reading.

The eight higher-order bits of DMATCR are always read as 0, and the write value should always be 0.

44.2.14 DMA Transfer Count Registers B_0 to 31 (DMATCRB_0 to DMATCRB_31)

| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
|--------|--------------------------|--------|--------|
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

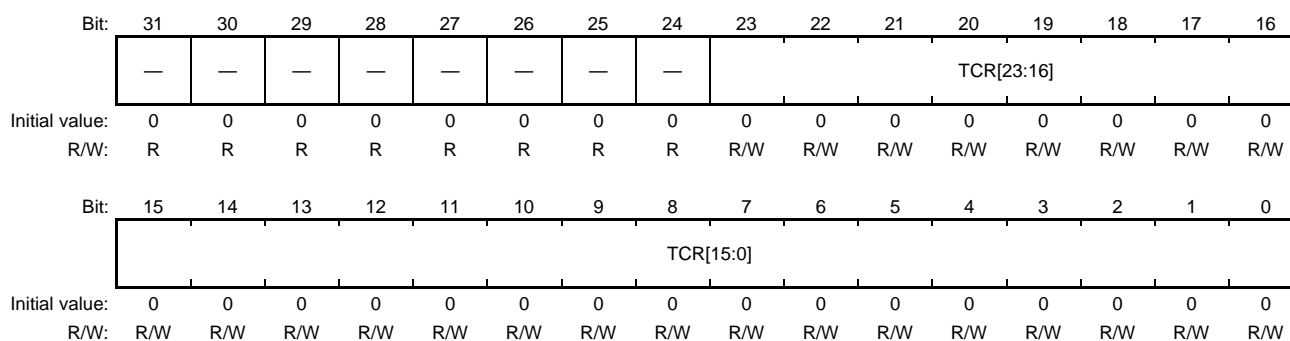

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMATCRB is a 32-bit readable/writable register that specifies the number of rounds of DMA transfer. The number of rounds of DMA transfer is 1 when the setting is H'0000_0001 and 16,777,215 (the maximum) when the setting is H'00FF_FFFF. During a DMA transfer, this register indicates the remaining number of rounds of transfer.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, the read transfer counter and write transfer counter have different values. This register indicates the counter value used in writing.

The eight higher-order bits of DMATCRB are always read as 0, and the write value should always be 0.

**44.2.15 DMA Transfer Size Registers 0 to 31 (DMATSR_0 to DMATSR_31)**

| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
|--------|--------------------------|--------|--------|
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMATSR is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'0000_0001, 4,294,967,295 bytes when the setting is H'FFFF_FFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'0000_0000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the read transfer size.

**44.2.16 DMA Transfer Size Registers B_0 to 31 (DMATSRB_0 to DMATSRB_31)**

| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
|--------|--------------------------|--------|--------|
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMATSRB is a 32-bit readable/writable register that specifies a total amount of memory to be transferred. The total size of DMA transfer is 1 byte when the setting is H'0000_0001, 4,294,967,295 bytes when the setting is H'FFFF_FFFF, and 4,294,967,296 bytes (the maximum) when the setting is H'0000_0000. During a DMA transfer, this register indicates the remaining amount of memory to be transferred. This register is used in total size transmission.

The audio-DMAC includes independent data buffers for reading and writing. Therefore, reading and writing will have different transfer sizes. This register indicates the value of the write transfer size.

44.2.17 DMA Channel Control Registers 0 to 31 (DMACHCR_0 to DMACHCR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMACHCR is a 32-bit readable/writable register that controls the DMA transfer mode.

| | | | | | | | | | | | | | | | | |

The TE bit is not set to 1 in the following cases.</p> <ul style="list-style-type: none"> DMA transfer ends due to a DMA address error before DMATCR becomes 0. DMA transfer is aborted by clearing the DE and DME bits in DMAOR. <p>To clear the TE bit, start by reading it as 1, and then write 0 to it.</p> <p>When the TE bit is set to 1, transfer is not possible even if the DE bit is set to 1.</p> <p>0: DMA transfer is in progress or was aborted [Clearing condition] Writing of 0 after reading of 1</p> <p>1: DMA transfer ended on the specified count (TCR = 0)</p> |
| 0 | DE | B'0 | R/W | <p>DMA Enable</p> <p>Enables or disables DMA transfer. In the auto request mode, a DMA transfer is started by setting the DE and DME bits in DMAOR to 1. At this time, the setting of both the AE and TE bits in DMAOR must be 0. In a peripheral module request, a DMA transfer starts if the transfer request is generated by the selected device or on-chip peripheral module after setting the DE and DME bits to 1. In this case too, the settings of both the TE and AE bits must be 0. Clearing the DE bit to 0 aborts all DMA transfer.</p> <p>Note: Ensure that the setting of the DE bit is actually 0 after clearing it.</p> <p>0: DMA transfer is disabled.</p> <p>1: DMA transfer is enabled.</p> |

Note: * Writing 0 is possible to clear the flag.

44.2.18 DMA Channel Control Register B_0 to 31 (DMACHCRB_0 to DMACHCRB_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMACHCRB is a 32-bit readable/writable register that controls the DMA transfer mode.

| | | | | | | | | | | | | | | | | |
|----------------|-----------|-----|-----|-----|-----|-----|-----|-----|-----------|-----|-----|----------|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | DCNT[7:0] | | | | | | | | DPTR[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | DRST | — | — | — | — | — | — | DTS | SLM[3:0] | | | PRI[3:0] | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|----------|-----------|---------------|-----|---|
| 31 to 24 | DCNT[7:0] | H'00 | R/W | Number of Stages of Descriptor Memory Specify the number of stages of the descriptor memory as DCNT + 1. When the descriptor memory is enabled, a transfer end (TE) interrupt is only generated for the CPU on completion of transfer under control of the specified number of stages. |
| 23 to 16 | DPTR[7:0] | H'00 | R | Descriptor Pointer This bit indicates the pointer to the next descriptor to be read. It is cleared to 0 when the last descriptor of the number of stages specified by DCNT[7:0] is read. It is also cleared to 0 when 1 is written to DRST. |
| 15 | DRST | B'0 | W | Descriptor Reset Resets the descriptor pointer. Before the descriptor memory is used, the pointer must be reset by writing 1 to this bit. This bit is always read as 0. |
| 14 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 8 | DTS | B'0 | R/W | Total Size Transmission under Descriptor Control This bit is only effective when total size transmission is selected. 0: The TCR fields of the descriptors are used as transfer count settings. 1: The TCR fields of the descriptors are used as total size settings. |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|--------|----------|---------------|-----|---|
| 7 to 4 | SLM[3:0] | B'0000 | R/W | <p>DMA Transfer Low-Speed Mode</p> <p>Specify the number of cycles of the AXI-bus clock (256.66 MHz) for the DMA transfer. One round of DMA transfer is executed in the number of cycles of the clock specified by this bit.</p> <p>B'0000: Normal mode</p> <p>B'1000: On round in 256 cycles of the clock.</p> <p>B'1001: On round in 512 cycles of the clock.</p> <p>B'1010: On round in 1024 cycles of the clock.</p> <p>:</p> <p>B'1111: On round in 32768 cycles of the clock.</p> <p>Other than above: Setting prohibited</p> |
| 3 to 0 | PRI[3:0] | B'0000 | R/W | <p>Channel Request Priority Setting</p> <p>These bits should be written by 0.</p> |

44.2.19 DMA Buffer Control Registers 0 to 31 (DMABUFCR_0 to DMABUFCR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMABUFCR is a 32-bit readable/writable register that controls the upper limit on buffer size in and burst unit for the SDRAM.

Use this register when the upper limit on buffering requires control.

| | | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----------|----------|-----|-----|-----|-----|-----|-----|-----|-----|---|---|---|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | | |
| | — | — | — | — | — | — | — | MBU[8:0] | | | | | | | | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | | |
| R/W: | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | | |
| | — | — | — | — | — | — | ULB[9:0] | | | | | | | | | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | | |
| R/W: | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | | | |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|----------|----------|---------------|-----|---|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 to 16 | MBU[8:0] | H'080 | R/W | Maximum Burst Unit for SDRAM This register is only effective for SDRAM access, and everything other than that is under control of the transfer size (unit). Settings bigger than ULB are prohibited. Power-of-two settings are recommended. Maximum value is 256 (bytes). |
| 15 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 to 0 | ULB[9:0] | H'100 | R/W | Upper Limit on Buffer Size This register controls the upper limit value for buffering. Power-of-two settings are recommended. Maximum value is 512 (bytes). |

44.2.20 DMA Extended Resource Selectors 0 to 31 (DMARS_0 to DMARS_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMARS is a 16-bit readable/writable register that specifies the on-chip peripheral module to be the source of the DMA transfer request for the given channel. DMARS_0 specifies the source for channel 0, DMARS_1 specifies the source for channel 1 and so on.

When bits MID and RID are set to a value other than the values listed in Table 44.5, the operation of this LSI is not guaranteed. Transfer requests from the source selected in DMARS are only valid when the resource selection bits (RS[3:0]) in DMACHCR have been set to B'1000. Otherwise, even if DMARS has been set, requests from the corresponding transfer request source are not accepted.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|---|---|----------|-----|-----|-----|-----|-----|----------|-----|
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | MID[5:0] | | | | | | RID[1:0] | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

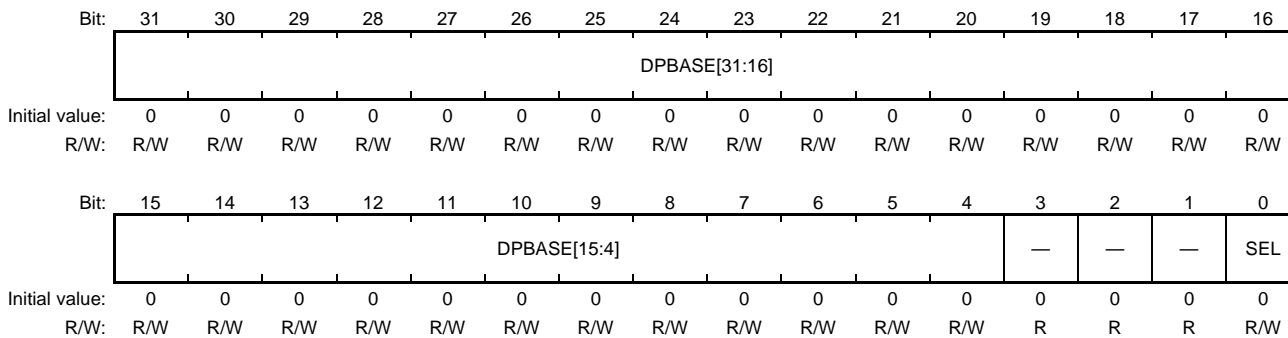

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|---------|----------|---------------|-----|--|
| 15 to 8 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 7 to 2 | MID[5:0] | All 0 | R/W | DMA Request Source Adoption MID[5] to MID[0] (MID) See Table 44.5. |
| 1, 0 | RID[1:0] | B'00 | R/W | DMA Request Source Adoption RID[5] and RID[0] (RID) See Table 44.5. |

44.2.21 DMA Descriptor Base Address Registers 0 to 31 (DMADPBASE_0 to DMADPBASE_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.
 RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)
 RZ/G2E: 16 channels (channels 0 to 15)

DMADPBASE specifies the base address of the descriptor memory. The address range of the descriptor memory is specified by setting this register.

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|---------|--------------|---------------|-----|---|
| 31 to 4 | DPBASE[31:4] | All 0 | R/W | Base Address of Descriptor Memory Setting example: When Built-in memory is used, [Audio-DMAC Lower]: H'EC70 A00 to H'EC70 A7F [Audio-DMAC Higher]: H'EC72 A00 to H'EC72 A7F When External memory is used, Other memory area on a 16-byte boundary |
| 3 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | SEL | B'0 | R/W | Descriptor Memory Selection Selects the memory to be used as descriptor memory. 0: Setting Prohibited 1: Built-in memory or External memory is used. |

44.2.22 DMA Descriptor Control Registers 0 to 31 (DMADPCR_0 to DMADPCR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMADPCR is a 32-bit readable/writable register that controls the timing with which interrupts are output in read-out interrupt mode (descriptor mode 3).

| | | | | | | | | | | | | | | | | |
|----------------|-----------|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | DIPT[7:0] | | | | | | | | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|----------|-----------|---------------|-----|--|
| 31 to 24 | DIPT[7:0] | H'00 | R/W | Descriptor Read-out Interrupt Pointer The number of stages for which descriptor read-out interrupts are generated in descriptor mode 3. DIPT + 1 specifies the number of descriptor stages. |
| 23 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

44.2.23 DMA Fixed Source Address Registers 0 to 31 (DMAFIXSAR_0 to DMAFIXSAR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMAFIXSAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit source address for a DMA transfer.

This register is not incremented by carrying when DMASAR overflows. And when uTLB function is effective, this register is invalid.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | SAR[39:32] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

44.2.24 DMA Fixed Destination Address Registers 0 to 31 (DMAFIXDAR_0 to DMAFIXDAR_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMAFIXDAR is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit destination address for a DMA transfer.

This register is not incremented by carrying when DMADAR overflows. And when uTLB function is effective, this register is invalid.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | DAR[39:32] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

44.2.25 DMA Fixed Descriptor Base Address Registers 0 to 31 (DMAFIXDPBASE_0 to DMAFIXDPBASE_31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Note: The availability of channels depends on the product as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N: 32 channels (channels 0 to 31)

RZ/G2E: 16 channels (channels 0 to 15)

DMAFIXDPBASE is a 32-bit readable/writable register that specifies the most significant 8 bits of the 40-bit descriptor base address for a DMA transfer. And when uTLB function is effective, this register is invalid.

| | | | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|---------------|-----|-----|-----|-----|-----|-----|-----|---|---|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | | |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | | |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | | |
| | — | — | — | — | — | — | — | — | DPBASE[39:32] | | | | | | | | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | | |
| R/W: | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | | |

44.2.26 Descriptor Memory (DescriptorMEM)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

See section 44.3.4, Descriptor Memory.

44.2.27 Secure function Secure Status register for channel 0 to 15 (DMASES_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMASES_L is a 32-bit readable/writable register that contain error status of secure function of channel 0 to 15.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | Error |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|---------|----------|---------------|-----|--|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | Error | B'0 | R/W | Error status of channel 0 to 15 Read: 0: No Error detected. 1: Error detected. Write*: 0: No operation 1: Clear DMASES_L, DMASEMID_L, DMASEDDR_L register. |

44.2.28 Secure function Secure Status register for channel 16 to 31 (DMASES_U)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

DMASES_U is a 32-bit readable/writable register that contain error status of secure function of channel 16 to 31.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | Error |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

44.2.31 Secure function Error Master ID register for channel 0 to 15 (DMASEMID_L)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

DMASEMID_L is a 32-bit readable register that contain first Master ID when access to channel 0 to 15 was denied.

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|---------|------------|---------------|-----|--|
| 31 to 0 | EMID[31:0] | All 0 | R | First Master ID when access to channel 0 to 15 was denied. |

44.2.32 Secure function Error Master ID register for channel 16 to 31 (DMASEMID_U)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

DMASEMID_U is a 32-bit readable register that contain first Master ID when access to channel 16 to 31 was denied.

| Bit | Bit Name | Initial Value | R/W | Descriptions |
|---------|------------|---------------|-----|---|
| 31 to 0 | EMID[31:0] | All 0 | R | First Master ID when access to channel 16 to 31 was denied. |

44.3 Operation

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

When there is a DMA transfer request, the DMAC starts the transfer according to the predetermined channel priority, when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in two modes: auto request and on-chip peripheral module request. The bus mode can be selected from normal speed mode and slow speed mode).

44.3.1 DMA Transfer Requests

Most commonly, DMA transfer requests are generated by either the source or destination for transfer, but they can also be generated by on-chip peripheral modules that are neither the source nor the destination. Transfers can be requested in two modes: auto request, and on-chip peripheral module request. The request mode is selected for each channel by DMARS.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, auto-request mode allows the audio-DMAC to automatically generate a transfer request signal internally. When the DE bit in DMACHCR and the DME bit in DMAOR are set to 1 for the target channel, the transfer begins so long as the CAE bit in DMACHCR is 0.

(2) On-Chip Peripheral Module Request Mode

This mode is in case of CHCR.RS = 1000.

In this mode, a transfer is performed at the transfer request signal of an on-chip peripheral module. The source (on-chip peripheral module) of the DMA transfer request is specified by DMARS.

When this mode is selected, if the DMA transfer is enabled (DE = 1, DME = 1, TE = 0, CAE = 0), a transfer is performed upon the input of a transfer request signal.

When a transmit data empty transfer request of the SCIF is set as the transfer request, the transfer destination must be the SCIF's transmit data register. Likewise, when receive data full transfer request of the SCIF is set as the transfer request, the transfer source must be the SCIF's receive data register. These conditions also apply to the other on-chip peripheral modules.

The number of the receive FIFO triggers can be set as a transfer request depending on an on-chip peripheral module. Data needs to be read after the DMA transfer is ended, because data may be left in the receive FIFO when the receive FIFO trigger condition is not satisfied.

Table 44.5 Selecting On-Chip Peripheral Module Request Modes

44.3.2 Channel Priority

When the audio-DMAC receives simultaneous transfer requests on two or more channels, it transfers data according to a predetermined priority. Two modes (fixed mode and round-robin mode) are selected by the PR[1:0] bits in DMAOR.

(1) Fixed Mode

In this mode, the priority levels among the channels remain fixed.

CH0 > CH1 > ... > CH11 > CH12, CH13 > CH14 > ... > CH25 > CH26 > CH27 > CH28 > CH29 > CH30 > CH31

(2) Round-Robin Mode

In round-robin mode, each time data of one transfer unit (byte, word, long-word, 8-byte or 16-byte units) is transferred on one channel, the priority is rotated. The channel on which the transfer was just finished rotates to the bottom of the priority. The priority of round-robin mode is CH0 > CH1 > ... > CH11 > CH12 > ... > CH24 > CH25 > ... > CH30 > CH31 immediately after reset.

44.3.3 Slow Speed Mode

In the low-speed mode, a single round of DMA transfer is performed every time the number of clock cycles specified by the SLM bits in DMACHCRB elapse. This mode can be selected per DMA channel. Transfer on other channels can proceed after each round of transfer for a channel in the low-speed mode is completed.

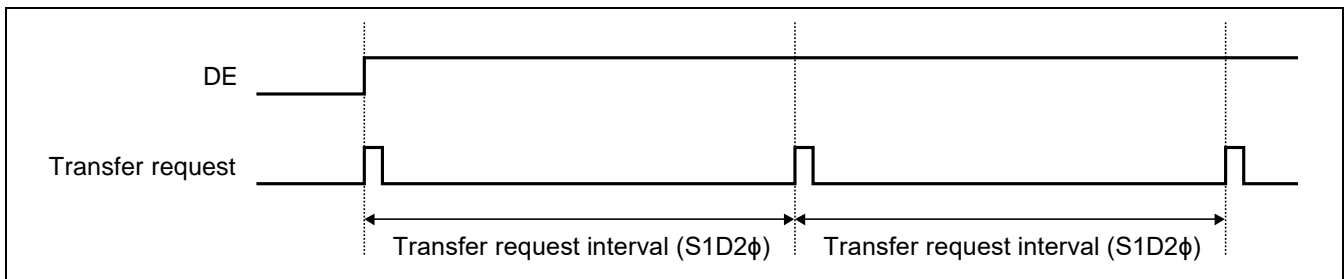

Figure 44.2 Slow Speed Mode

44.3.4 Descriptor Memory

The descriptor memory function is selected by setting the DPM[1:0] bits in DMACHCR to B'01, B'10, or B'11. When DMATCR is set to 0 and the DMA transfer is completed, the next set of settings is read, and if only a single channel is enabled, the contents defined by up to 128 stages of descriptor memory can be consecutively transferred when the built-in descriptor memory is used. External memory can also be used as the descriptor memory. In that case, the contents defined by up to 256 stages of descriptor memory can be transferred.

The following initial settings are required to use the descriptor memory.

- Set the base address of the descriptor memory for the DMA transfer in DMADPBASE.
- Set the DRST bit in DMACHCRB to reset the descriptor memory.
- Set the number of stages of the descriptor memory in the DCNT bits of DMACHCRB.

The descriptor memory is shared between all channels. Ensure that the areas of descriptor memory for use by each of the channels do not overlap.

It is necessary to arrange each stage of the descriptor memory on a 16-byte boundary.

There are two methods to activate the descriptor memory as follows.

- Specify the first DMA transfer settings in DMASAR, DMADAR, and DMATCR, and specify the subsequent settings in the descriptor memory. Then, set the DPB bit in DMACHCR to 0 to activate the descriptor memory. In this case, after completion of the transfer specified in DMASAR, DMADAR, and DMATCR, transfer continues after new settings are read from the descriptor memory. Note, however, that, when the operating mode of the descriptor memory is set to the repeat mode, the values specified in DMASAR, DMADAR, and DMATCR are not read, and the transfer starts and is repeated from the head of the descriptor memory.
- Write the DMA transfer settings to the descriptor memory, and write 1 to the DPB bit in DMACHCR to activate the descriptor memory. In this case, the DMA transfer starts from the first settings in the descriptor memory.

There are three operating modes of the descriptor memory, which can be selected by setting the DPM bits in DMACHCR.

For details on these operating modes, see the descriptions of each operating mode in this section.

(1) Configuration of Descriptor Memory

Figure 44.3 shows the configuration of the built-in descriptor memory.

The capacity of the built-in descriptor memory is 16 bytes per stage × 128 stages.

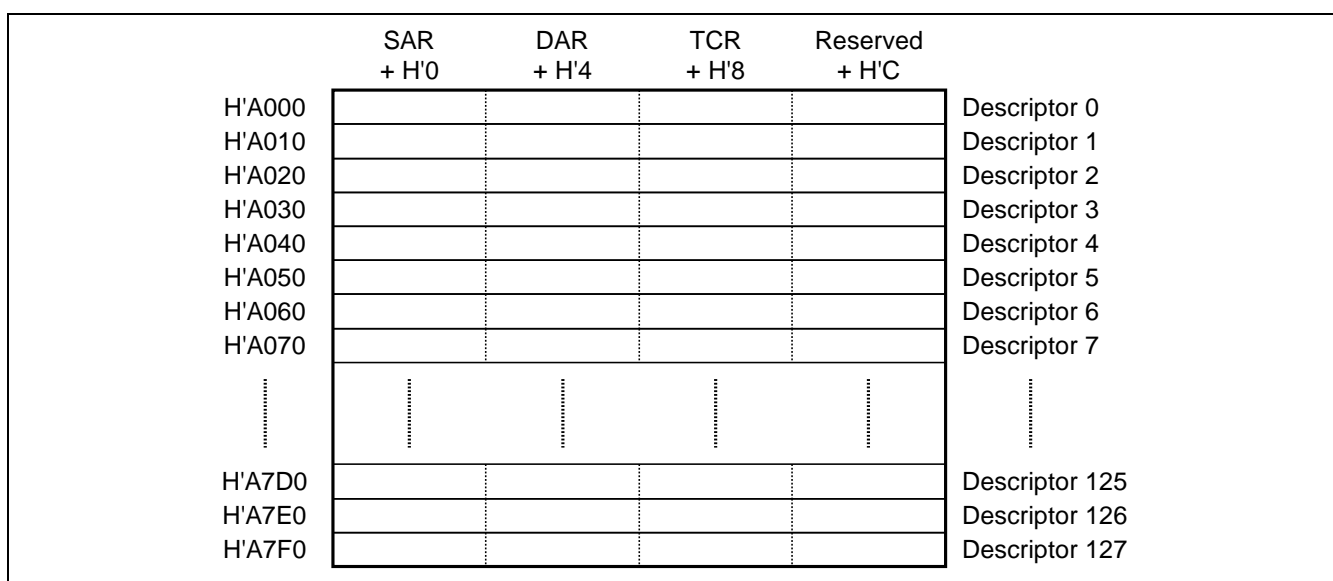

Figure 44.3 Configuration of Built-in Descriptor Memory

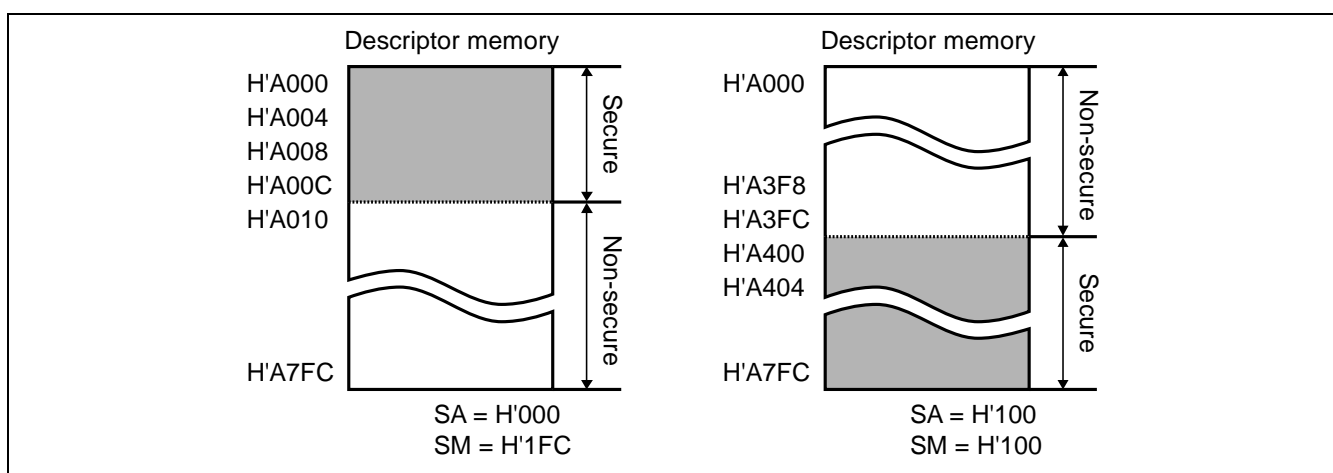

Figure 44.4 Example of DMADPSEC Setting

(2) Flow of Updating from Descriptor Memory

The RPT bits in DMACHCR can be used to specify which registers are to be updated from the descriptor memory.

The DPTR bits in DMACHCRB are incremented when updating from the descriptor memory is completed. If the DPTR value matches the DCNT value, the DPTR value is reset to 0.

This flow is automatically processed by hardware.

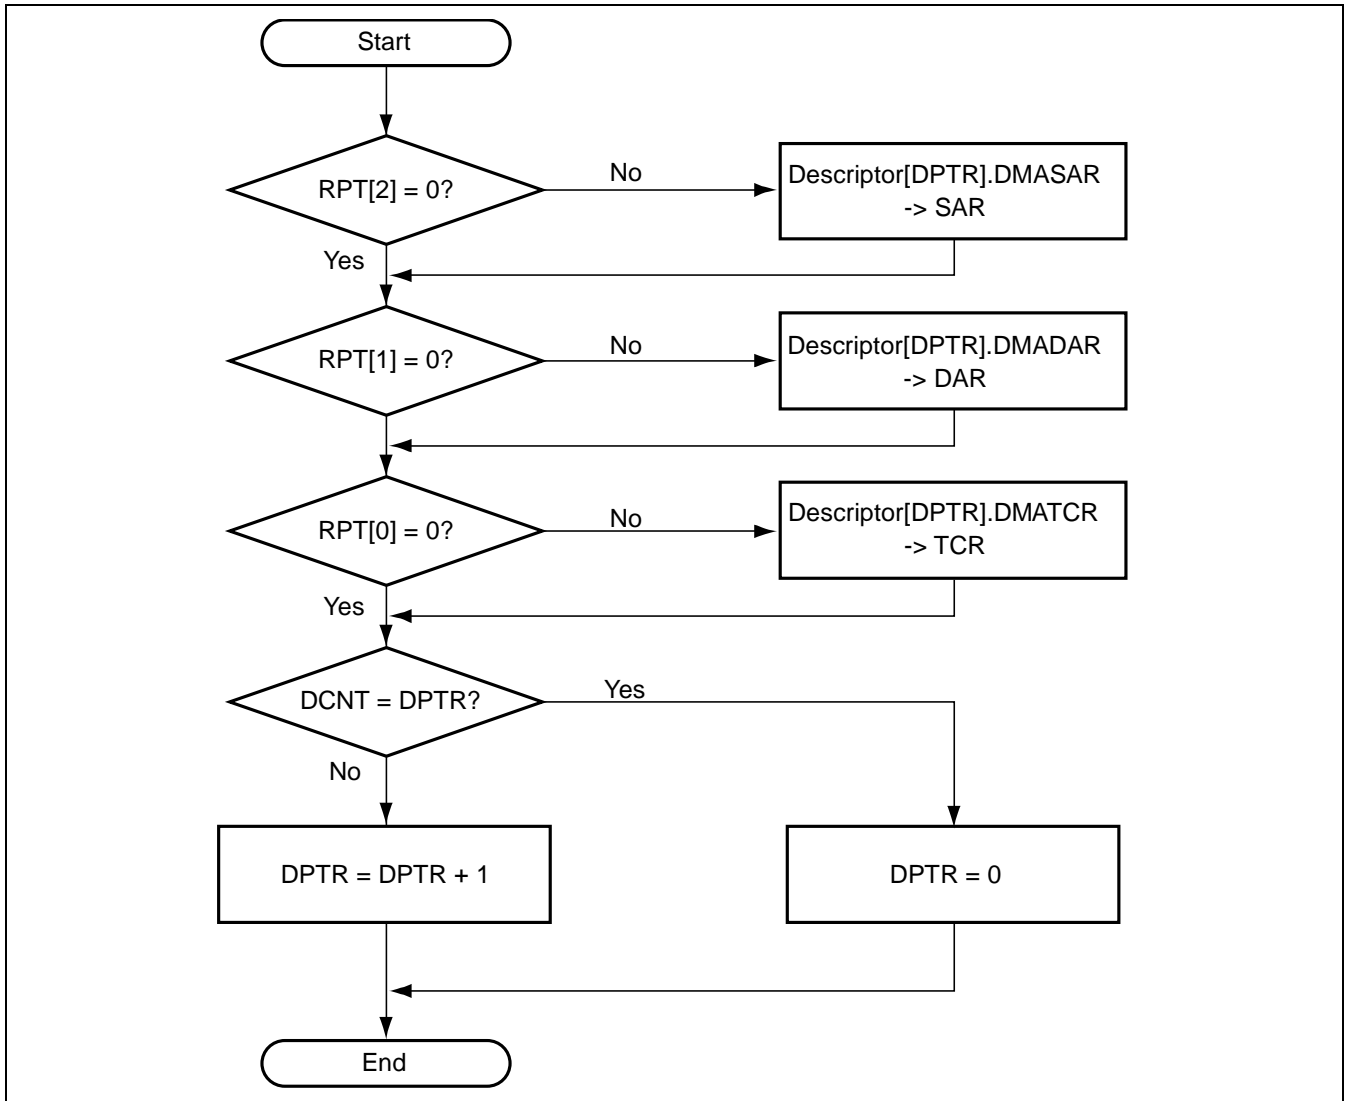

Figure 44.5 Flow of Updating from Descriptor Memory

(3) Operating Mode 1 of Descriptor Memory

Set the DPM bits in DMACHCR to B'01 to select operating mode 1 (normal mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, the DMA transfer is complete when the TE bit in DMACHCR is set to 1 after transfer under control of the number of stages of the descriptor memory specified in the DCNT bits in DMACHCRB.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

Figure 44.6 is an example of transfer when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 44.7 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 1 is selected and the TE and DSE bits are set to 1.

Figure 44.8 is an example of transfer when operating mode 1 is selected and the TE bit is set to 1.

In each example, there are four descriptor stages.

Figure 44.6 Operating Mode 1 (Example 1)

Figure 44.7 Operating Mode 1 (Example 2)

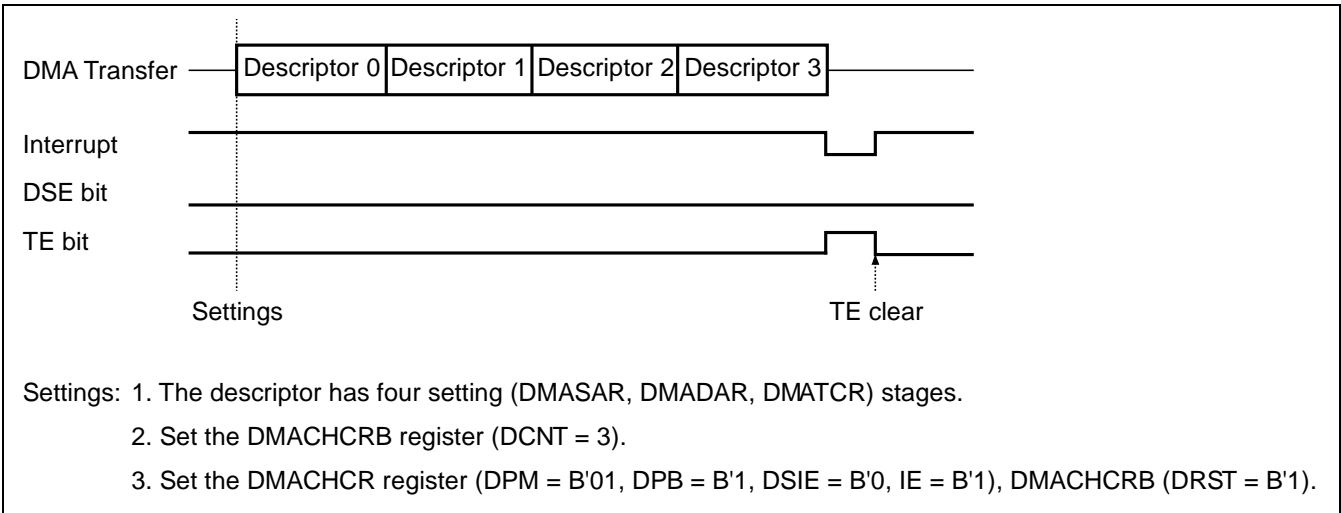

Figure 44.8 Operating Mode 1 (Example 3)

(4) Operating Mode 2 of Descriptor Memory

Set the DPM bits in DMACHCR to B'10 to select operating mode 2 (repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. If a first DSE interrupt has not been processed when a further DSE interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the DSE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

When the DSIE bit in DMACHCR is set to 0, after transfer under control of all stages of the descriptor memory is complete, the TE bit in DMACHCR is set to 1 and a TE interrupt is generated. If a TE interrupt has not been processed when a further interrupt is generated, the contents of the next stage of the descriptor memory are not read and the DMA transfer is aborted. Clearing the TE bit only causes clearing of the first interrupt and reading of the next stage of the descriptor memory.

To end operation in mode 2, change the mode to mode 1 by using the TE interrupt processing. When the mode is changed to mode 1, the DMA transfer is completed when the next TE interrupt is generated.

Figure 44.9 is an example of transfer when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 44.10 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE and DSE bits are set to 1.

Figure 44.11 is an example of transfer when operating mode 2 is selected and the TE bit is set to 1.

Figure 44.12 is an example of transfer when there is a delay in processing of the DSE interrupt when operating mode 2 is selected and the TE is set to 1.

In each example, there are four descriptor stages.

Figure 44.9 Operating Mode 2 (Example 1)

Figure 44.10 Operating Mode 2 (Example 2)

Figure 44.11 Operating Mode 2 (Example 3)

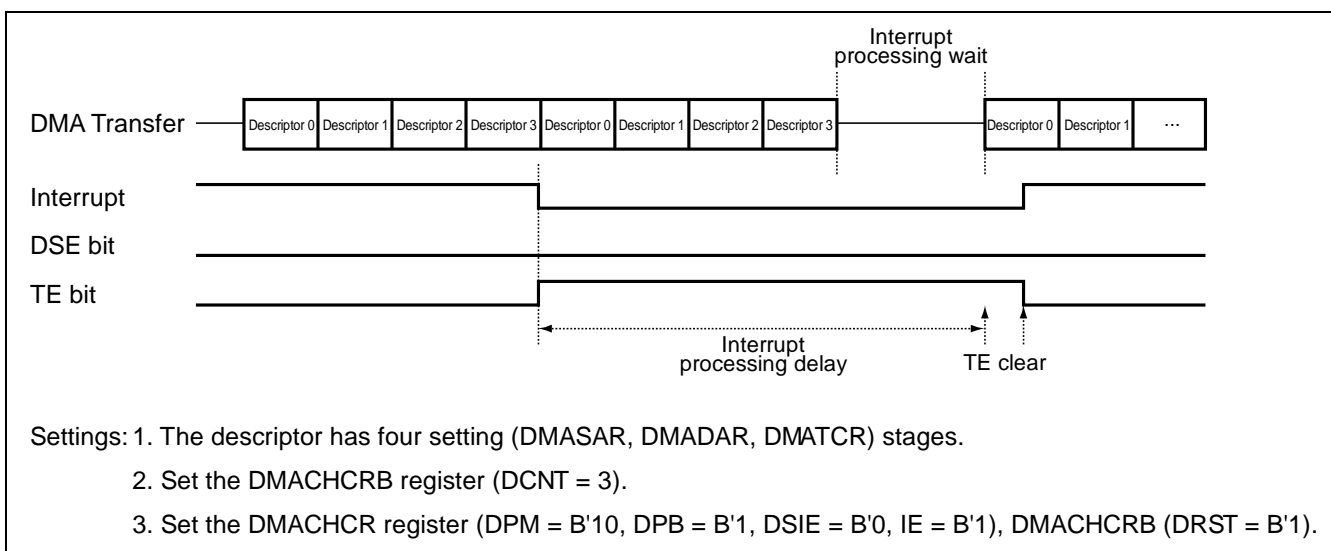

Figure 44.12 Operating Mode 2 (Example 4)

(5) Operating Mode 3 of Descriptor Memory

Set the DPM bits in DMACHCR to B'11 to select operating mode 3 (infinite repeat mode). This mode allows consecutive transfer under control of the descriptor memory.

In this mode, after transfer under control of the number of stages of descriptor memory specified in the DCNT bits in DMACHCRB, the TE bit in DMACHCR is set to 1. This operation is then repeated from the head of the descriptor memory.

When the DSIE bit in DMACHCR is set to 1, a DSE interrupt is generated every time transfer under the control of one stage of descriptor memory is complete. Even if a first DSE interrupt has not been processed when a further DSE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of DSE interrupts that have been generated, the DSE bit can be cleared by writing to it once. Similarly, even if a first TE interrupt has not been processed when a further TE interrupt is generated, the DMA transfer is not aborted. Regardless of the number of TE interrupts that have been generated, the TE bit can be cleared by writing to it once.

Figure 44.13 is an example of transfer when infinite repeat mode is selected.

Figure 44.14 is an example of transfer when read-out interrupt mode is selected.

In each example, there are four descriptor stages.

Figure 44.13 Operating Mode 3 (Infinite Repeat Mode)

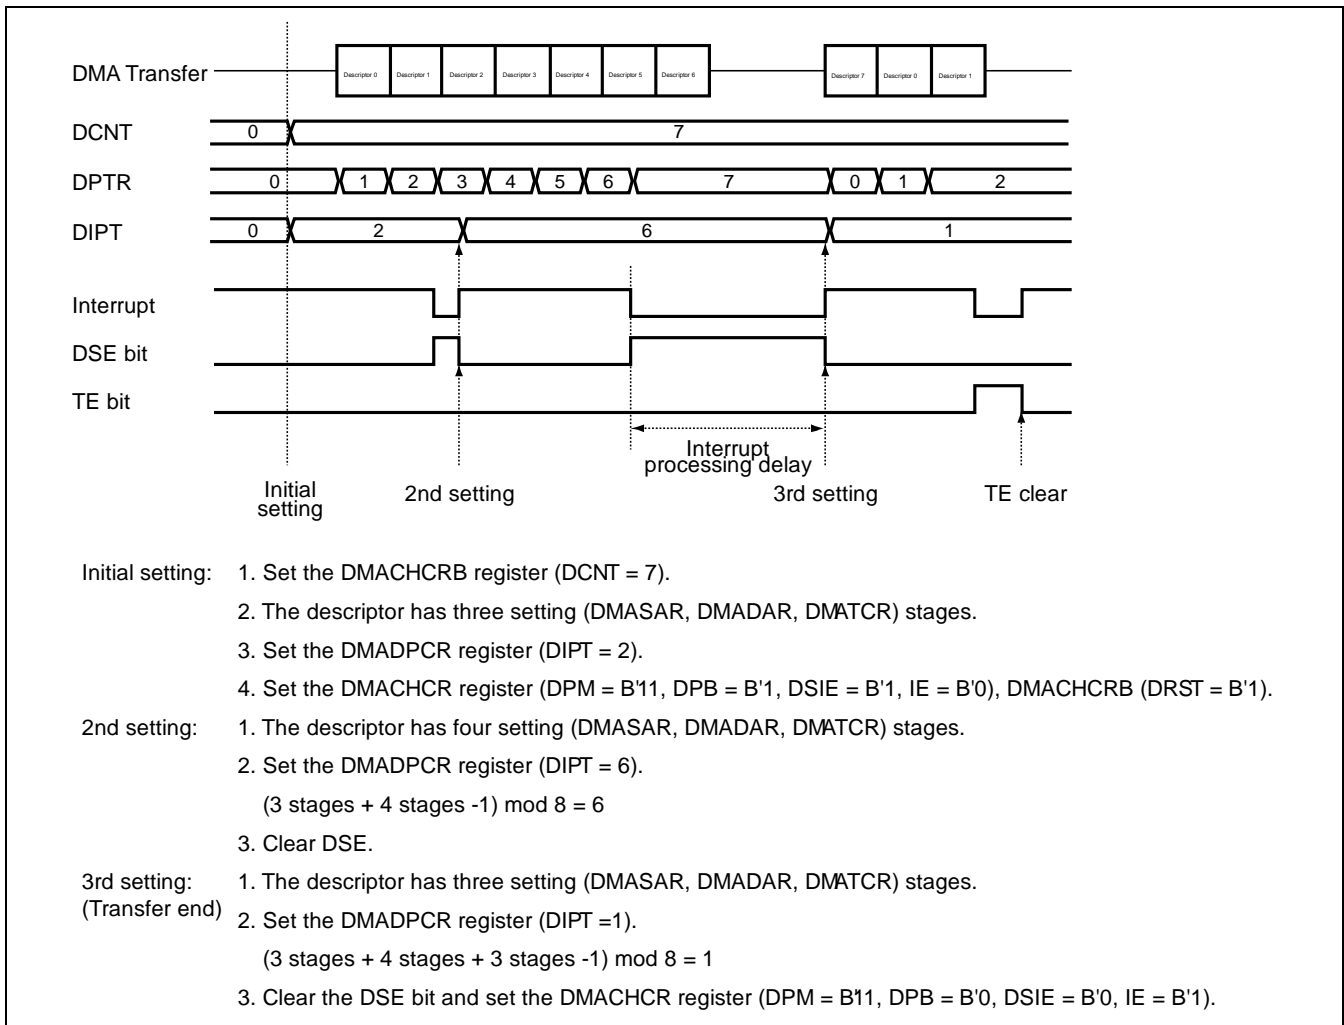

Figure 44.14 Operating Mode 3 (Read-Out Interrupt Mode)

(6) Using the Descriptor Memory for Double Buffering

To use the descriptor memory for double buffering, set the number of stages of descriptor memory to 2, set the buffer configuration to the descriptor memory, and activate the memory in operating mode 2. The DSE interrupt is used in double buffering. To end the use of double buffering, disable the descriptor operating mode, which stops the transfer on completion of the transfer currently in progress.

Figure 44.15 Using the Descriptor Memory for Double Buffering

44.3.5 Transmission Flow

Set the transfer conditions as required in the following registers:

DMA source address register (DMASAR), DMA destination address register (DMADAR), DMA transfer count register (DMATCR), DMA Channel control register (DMACHCR), DMA operation register (DMAOR) and DMA extended resource selector (DMARS)

The DMAC then transmits data in the following order.

- A transfer request is generated and the controller checks whether the transfer is allowed (DE = 1, DME = 1, TE = 0, DSE = 0, CAE = 0). When a channel is in the auto request mode, the transfer starts automatically.
- The controller checks whether updating from the descriptor memory is required.
Updating from the descriptor memory proceeds when the DPB bit in DMACHCR is set to 1 or the descriptor memory is enabled, if DMATCR is set to 0.
For updating by using the descriptor memory, see section 44.3.4, Descriptor Memory.
- Check whether address translation by the IPMMU is required.
Address translation by the IPMMU proceeds if the address exceeds the effective size for address translation when the DE bit in DMACHCR is enabled and updating of transfer settings from the descriptor memory is executed.
- Each time a transfer request is generated, the amount of data for a single round of transfer (specified by the TS[3:0] bits) is transmitted. The value in DMATCR is decremented by 1 every time the DMA transfer is completed.
- When the specified number of rounds of transfer are completed (the value in DMATCR is set to 0), the transfer ends normally. A TE interrupt is generated for the CPU upon the end of the transfer if the IE bit in DMACHCR is set to 1. If the descriptor memory is enabled, the processing differs with the mode of the descriptor memory. For more details, see section 44.3.4, Descriptor Memory.
- Transfer is aborted when the DMAC encounters an address error. Transfer is also aborted when the DE bit in DMACHCR or the DME bit in DMAOR is set to 0.

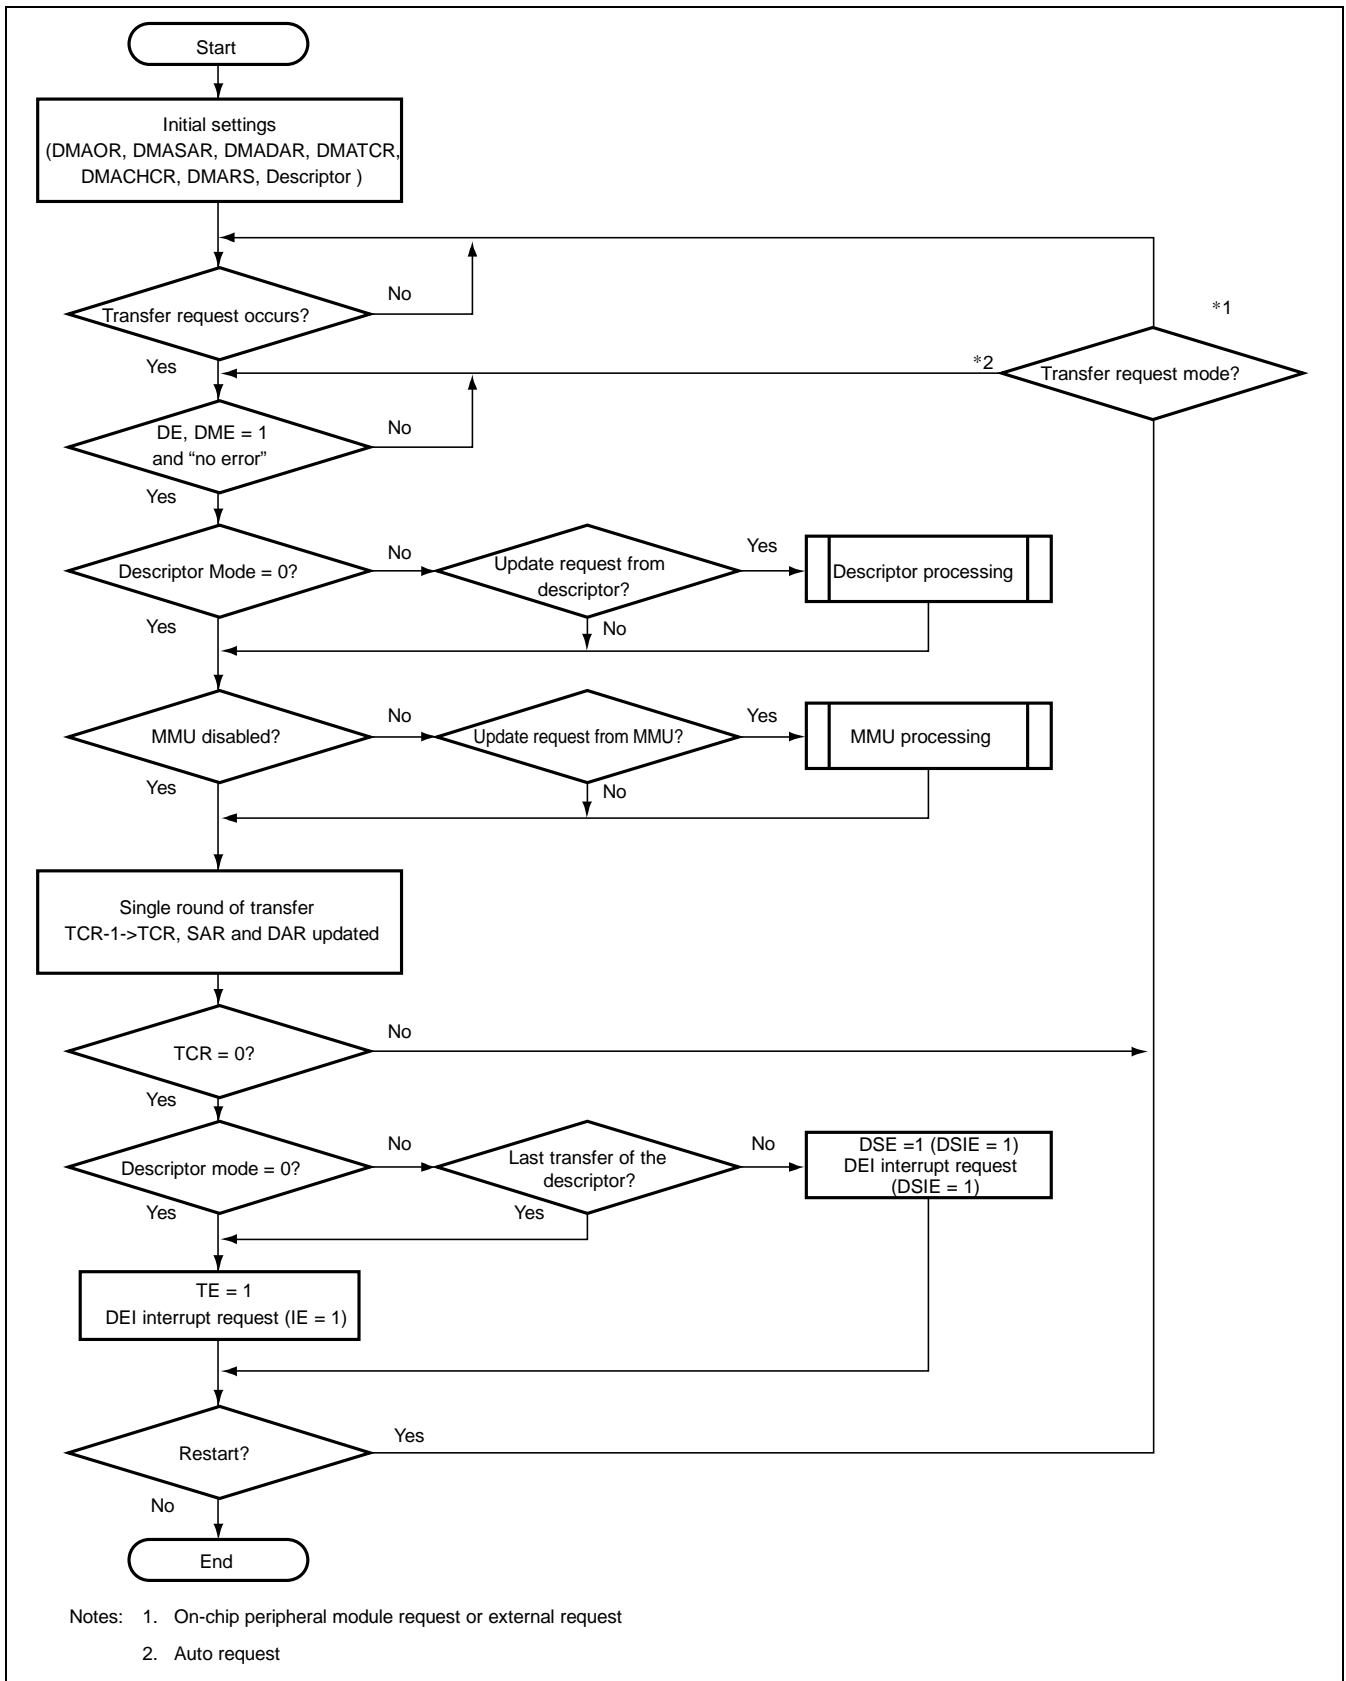

Figure 44.16 Transmission Flow

44.3.6 Total Size Transmission

The amount of data for total size transmission can be set in DMATSR (in bytes), and this setting is effective regardless of the size specified in the TS bits in DMACHCR. Thereby, the desired size can be transmitted in a single round of DMA transfer.

To use this function, make the settings for total size transmission in DMASAR, DMADAR, DMATSR, DMATSRB and DMACHCR.

Total size is set in the TCR (TSR) field of descriptors and 1 is set in DMACHCRB.DTS when total size transmission and descriptors are in use.

44.4 Usage Notes

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

Pay attention to the following notes when using the audio-DMAC.

(1) DMA Transfer for Peripheral Modules

When executing DMA transfer for an on-chip peripheral module, set addresses on the appropriate boundary (in terms of the amount of data for each round of transfer) for the transfer source and destination addresses. Otherwise, an address error may occur.

(2) Module Stop

While the audio-DMAC is operating, the module stop register (MSTPCR5) should not be set to stop the audio-DMAC. If the audio-DMAC is stopped in this way, results of the transfer that was in progress cannot be guaranteed.

(3) Address Error

When a DMA address error is generated, reset the registers of the channel on which the error has occurred and then start transfer anew.

(4) Aborting DMA Transfer

To abort a DMA transfer, disable the interrupt signal and set the DE bit in the DMA channel control register (DMACHCR) to 0 to disable the DMA transfer. If the TE and DSE bits are set when DMA transfer is aborted, these bits should be initialized. There is a possibility that TE and DSE will not be set with synchronized timing after transmission, so it's necessary to recognize the following three possibilities and take measures accordingly.

1. The DSE and TE bits are set to 1 before initialization of DMACHCR, but after the interrupt was disabled.
The TE and DSE bits are initialized within the DMA transfer initialization sequence.
2. The DSE and TE bits are set to 1 and the controller fails to abort the transfer, after the interrupt was disabled.
When the DE bit has become 0 after DMA transfer initialization, check the TE and DSE bits. If the TE or DSE bit is 1, go through the DMA transfer initialization process.
3. The TE and DSE bits are not cleared to 0 but the transfer is aborted, after the interrupt is disabled.
The TE or DSE bits are not set because data for transfer still remain after transfer is aborted.

Note: Initialization of DMA transfer during execution of the last transfer leads to a delay in setting of the TE and DSE bits, so include a dummy read.

Figure 44.17 shows an example of processing to abort DMA transfer.

Figure 44.17 Example of Processing to Abort DMA Transfer

45.1 Overview

The Audio DMAC-Peripheral-Peripheral module controls data transfer between the audio modules connected to the audio local bus.

45.1.1 Features

[RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N]

- Number of channels: 29 channels + 29 channels(extended)
- Data transfer size: Longword (4 bytes)
- Addressing mode: Dual addressing; fixed access size
- Transfer count: Not programmable
- Interrupt processing: None

[RZ/G2E]

- Number of channels: 29 channels (extended)
- Data transfer size: Longword (4 bytes)
- Addressing mode: Dual addressing; fixed access size
- Transfer count: Not programmable
- Interrupt processing: None

45.1.2 Block Diagram

- Notes:
1. N indicates the DMAC channel number (n = 0 to 28)
 2. Access the listed registers from the CPU in longword (32-bit) units; byte or word access is prohibited.
 3. Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

45.1.5 Connected Module

Table 45.2 Connected module

| Module name | Connected module name | Function of connected module |
|----------------------------------|------------------------------|-------------------------------------|
| Audio DMAC-Peripheral-Peripheral | APMU | Access the Register |
| | CPG | Output Clocks |
| | SSIU | Serial Sound Interface Unit |
| | SSI | Serial Sound Interface |
| | SCU | Sampling Rate Converter Unit |

45.2 Register Description

[Legend]

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC1: Readable/writable. Writing 1 initializes the bit, and writing 0 is ignored.

R: Read-only. The write value should always be 0.

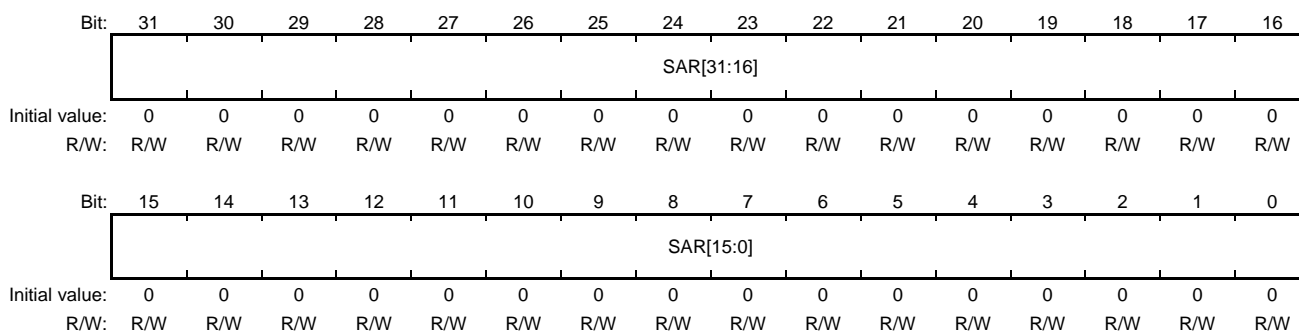

—/W: Write-only. The read value is undefined.

45.2.1 PDMA Source Address n Register (PDMASARn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

Function: Sets the DMA transfer source address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---------------------------------------|
| 31 to 0 | SAR | All 0 | R/W | Sets the DMA transfer source address. |

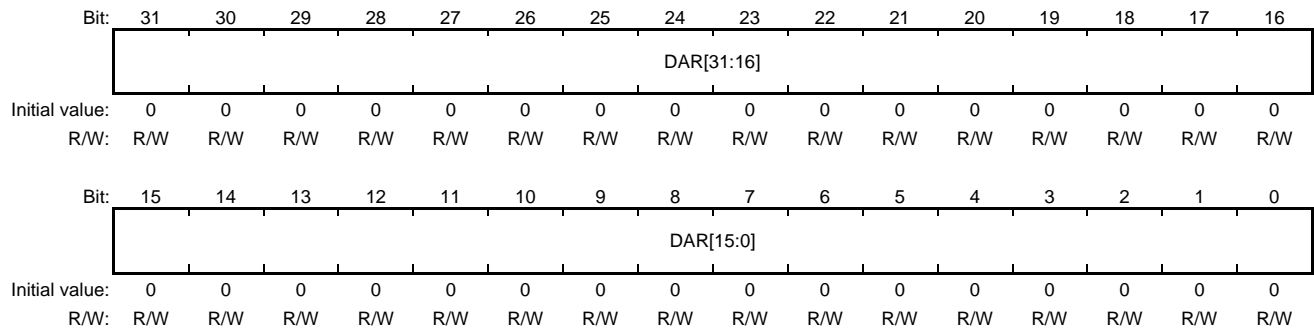

Note: It's prohibited to set same source address in other channels including PDMASARn and PDMASAREn.

45.2.2 PDMA Destination Address n Register (PDMADARn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

Function: Sets the DMA transfer destination address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | DAR | All 0 | R/W | Sets the DMA transfer destination address. |

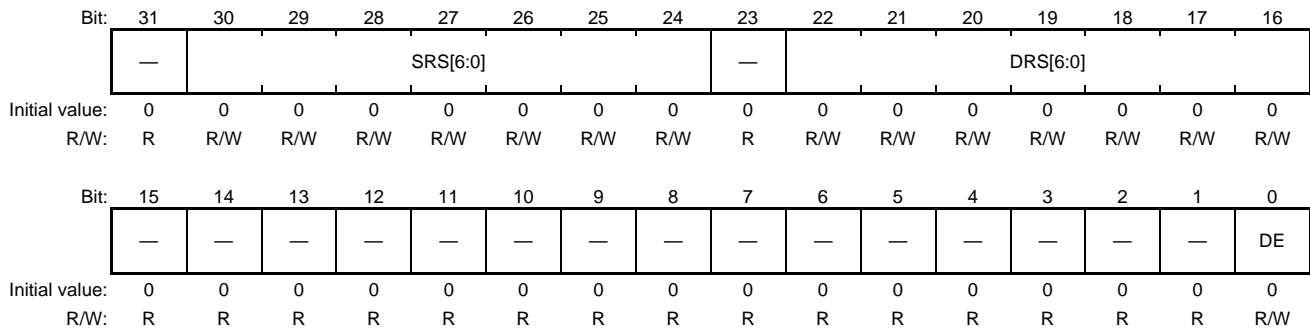

Note: It's prohibited to set same destination address in other channels including PDMADARn and PDMADAREn.

45.2.3 PDMA Channel Control n Register (PDMACHCRn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | — |

Function: Selects the request sources of DMA transfer source and destination, and also starts or stops DMA.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 24 | SRS | H'00 | R/W | Transfer Source Request Source Select (setting H'00 to H'38 and the values with “—” are prohibited) Refer to Table 45.3. |
| 23 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 22 to 16 | DRS | H'00 | R/W | Transfer Destination Request Source Select (setting H'00 to H'36 and the values with “—” are prohibited) Refer to Table 45.3. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | DE | B'0 | R/W | DMA Enable To enable DMA transfer function, set this bit to 1. Clearing this bit to 0 stops transfer. Note: Even if 0 is written to this bit while it is 1, 1 is read out until the transfer is completed. |

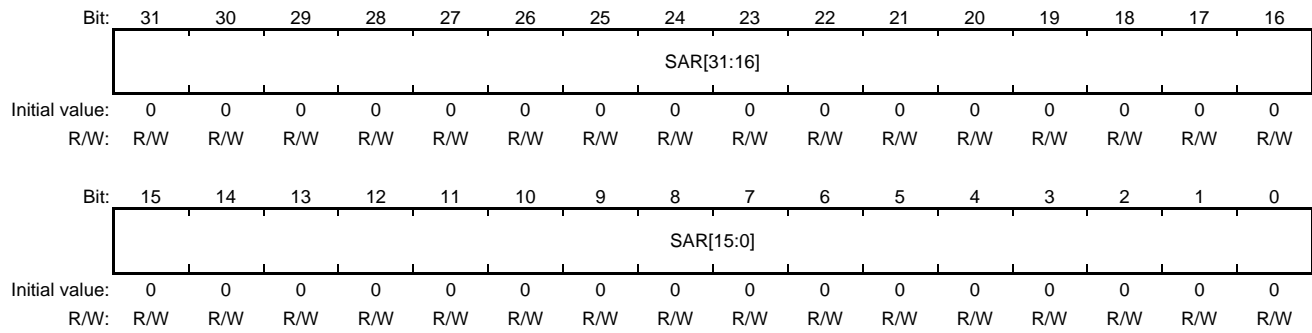

- Notes:
1. It's prohibited to set same source/destination request source in other channels including PDMACHCRn.SRS/DRS and PDMACHCREn.SRS/DRS.
 2. When clearing DE bit, do not change other bits.

45.2.4 PDMA Source Address n Register (extended) (PDMASAREn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: Sets the DMA transfer source address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---------------------------------------|
| 31 to 0 | SAR | All 0 | R/W | Sets the DMA transfer source address. |

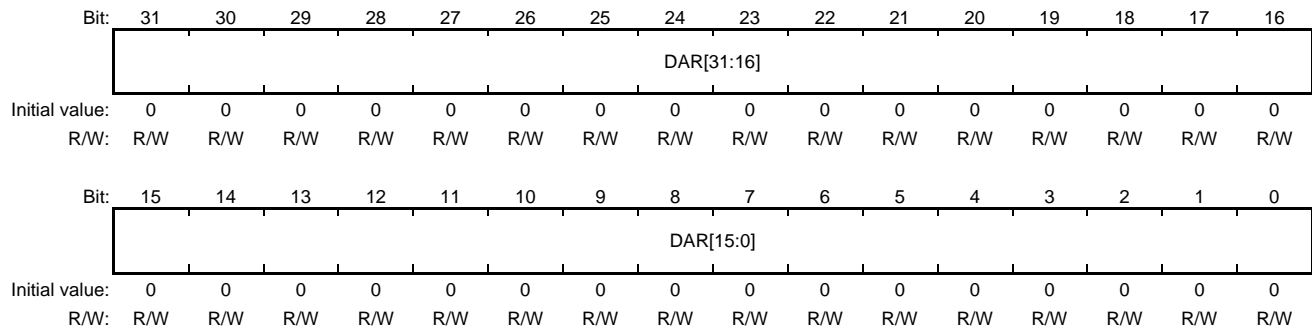

Note: It's prohibited to set same source address in other channels including PDMASARn and PDMASAREn.

45.2.5 PDMA Destination Address n Register (extended) (PDMADAREn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: Sets the DMA transfer destination address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | DAR | All 0 | R/W | Sets the DMA transfer destination address. |

Note: It's prohibited to set same destination address in other channels including PDMADARn and PDMADAREn.

45.2.6 PDMA Channel Control n Register (extended) (PDMACHCREn)

Note: n = 0 to 28

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Function: Selects the request sources of DMA transfer source and destination, and also starts or stops DMA.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 30 to 24 | SRS | H'00 | R/W | Transfer Source Request Source Select (setting H'00 to H'5B and the values with “—” are prohibited) Refer to Table 45.4(extended). |
| 23 | — | B'0 | R | Reserved This bit is always read as 0. The write value should always be 0. |
| 22 to 16 | DRS | H'00 | R/W | Transfer Destination Request Source Select (setting H'00 to H'5C and the values with “—” are prohibited) Refer to Table 45.4(extended). |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | DE | B'0 | R/W | DMA Enable To enable DMA transfer function, set this bit to 1. Clearing this bit to 0 stops transfer. Note: Even if 0 is written to this bit while it is 1, 1 is read out until the transfer is completed. |

- Notes:
1. It's prohibited to set same source/destination request source in other channels including PDMACHCRn.SRS/DRS and PDMACHCREn.SRS/DRS.
 2. When clearing DE bit, do not change other bits.

46. EthernetAVB-IF

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

46.1 Overview

The EthernetAVB-IF includes an Ethernet controller (E-MAC) that conforms to the definition of the MAC (Media Access Control) layer for Ethernet in the IEEE 802.3 standard.

When connected with a physical-layer LSI chip (PHY-LSI) that complies with the standard, the E-MAC is able to transmit and receive Ethernet (IEEE 802.3) frames. The E-MAC has a single MAC layer interface.

The EthernetAVB-IF has a dedicated direct memory access controller (AVB-DMAC) for transferring transmitted Ethernet frames to and received Ethernet frames from respective storage areas in the User RAM(URAM) at high speed.

The AVB-DMAC is compliant with the following three standards formulated for IEEE 802.1BA: the IEEE 802.1AS timing and synchronization protocol, the IEEE 802.1Qav real-time transfer, and the IEEE 802.1Qat stream reservation protocol.

In this section, URAM refers to the local RAM and external memory for the LSI.

46.1.1 Features

Table 46.1 lists the specifications of the EthernetAVB-IF module.

Table 46.1 Specifications (Functions)

| Item | Description |
|--|---|
| Protocol | Flow control conforming with the IEEE 802.3x standard |
| Data transmission and reception | Transmission and reception of Ethernet (IEEE 802.3) frames |
| Transfer speed | Supports transfer at 100 and 1000 Mbps |
| Mode | Full-duplex mode |
| Interface | Supports the RGMII (Reduced Gigabit Media Independent Interface) |
| Summary of the EthernetAVB-IF function | An intelligent frame separation DMAC (AVB-DMAC) conforming with the following standards stipulated for IEEE 802.1BA: IEEE 802.1AS (time synchronization protocol) IEEE 802.1Qav (real-time transfer) IEEE 1722 (AVTP presentation timestamp) IEEE 802.1Qat is supported by software. Descriptor management system Identification and sorting of frame data, and extraction and gathering of valid data Controllable interrupt frequency (reducing the load on the CPU) |
| Transmit/Receive FIFO | For transmission: 16Kbytes For reception: 8Kbytes |
| Max frame size | For transmission: 2047bytes For reception: 4092bytes |
| Magic Packet™ | Detection of Magic Packets™* and output of a detected signal |

Note: * Magic Packet™ is a trademark of Advanced Micro Devices, Inc.

46.1.2 Block Diagram

Figure 46.1, Figure 46.2, Figure 46.3 are block diagram of the EthernetAVB-IF.

46.1.5 Connected Module

Table 46.6 Connected module

| Module name | Connected module name | Function of connected module |
|--------------------|------------------------------|-------------------------------------|
| EthernetAVB-IF | AP-System Core | Access the Registers |
| | CPG | Output clocks |
| | PFC | Select the External pins |
| | Module Standby | Control to stop clocks |
| | Software Reset | Execute software reset |
| | INTC-SYS | Control to interrupt |
| | ADG | Output capture signal |
| | DU | Output capture signal |

46.2 Register Description

46.2.1 AVB-DMAC Mode Register (CCC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CCC register specifies the operating mode of the AVB-DMAC.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|------|-----|-----|-----|-----|-----|-----|-----|-----------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | FCE | LBME | — | — | — | — | — | — | — | CSEL[1:0] |

| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 26 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 25 | FCE | B'0 | R/W | Flow Control Enable This bit enables the flow control support of E-MAC. When flow control is enabled, the E-MAC gets informed about the Rx-FIFO level (Rx-FIFO fill level reached RCR.RFCL). 0: Flow control disabled 1: Flow control enabled |
| 24 | LBME | B'0 | R/W | Loopback Mode Enable This bit enables loopback mode. In loopback mode, the transmission lines are internally connected to the reception lines. When loopback mode is to be used, the Ethernet transmission clock must be supplied to the RGMII interface. A received clock signal is not required. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Normal operation 1: Loopback mode is enabled. Note: Data for transmission are still output normally. To eliminate effects on external modules, pin control should be applied to block the output of data. |
| 23 to 18 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 17, 16 | CSEL[1:0] | B'00 | R/W | <p>gPTP Clock Select</p> <p>These bits select the clock source for the gPTP timer.</p> <p>Writing to these bits is only possible when the current operating mode is configuration mode and CCC.GAC is 0.</p> <p>Writing to these bits is only possible when the current operating mode is Reset mode when writing CCC.GAC to 1 and CCC.OPC to B'01 by same write access.</p> <p>B'00: gPTP is disabled</p> <p>B'01: High-speed peripheral bus clock</p> <p>B'10 and B'11: Setting prohibited</p> |
| 15 to 9 | — | All 0 | R/W | <p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p> |
| 8 | DTSR | B'0 | R/W | <p>Data Transmission Suspend Request</p> <p>This bit can suspend access to the URAM.</p> <p>The access is suspended on completion of the transfer of the AXI transaction currently being transferred.</p> <p>This function disables access to the URAM without affecting normal operation of the AVB-DMAC. Use this bit when exclusive control over the contents of the URAM is necessary, for example, in checking its integrity.</p> <p>Note that the transmission and reception queues are not processed while access is suspended.</p> <p>Change neither the AVB-DMAC settings nor the mode while access is suspended.</p> <p>0: Normal operation</p> <p>1: Requests suspension</p> |
| 7 | GAC | B'0 | R/W | <p>Gptp Active in Config</p> <p>This bit enables the gPTP support of EthernetAVB-IF in CONFIG mode. Function of gPTP support in OPERATION and STANDBY is not influenced by this bit. When gPTP support is active in CONFIG, CCC.CSEL defines the timer clock source.</p> <p>The CPU can only write 1 to this bit if CSR.OPS is RESET when writing CCC.OPC to B'01 by same write access.</p> <p>0: Normal operation</p> <p>1: gPTP support active in CONFIG mode</p> |
| 6 to 2 | — | All 0 | R/W | <p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p> |

46.2.2 Descriptor Base Address Table Register (DBAT)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The DBAT register specifies the base address of the descriptor table in the URAM. For the structure of this table, see section 46.3.3 Descriptors. Writing to this bit is only possible when the current operating mode is configuration mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | TA[31:0] | H'0000_0000 | R/W | Descriptor Base Table Address Base address of the descriptor table in the URAM Note: The setting of this bit must be a multiple of four (i.e. bit 0 and bit 1 must be set to 0). |

46.2.3 Descriptor Base Address Load Request Register (DLR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The DLR register is used to issue a request to load the values from the current descriptor address register q (CDAR $_q$) for each queue to the descriptor base address table register (DBAT).

Setting a bit to 1 issues a request for loading the descriptor base address for the queue q . If transfer is currently in progress, loading is executed on completion of transfer for the current frame. Completion of loading leads to automatic setting of the corresponding bit to 0.

For the transmission queues, base address load requests are executed even while fetching is in progress (the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is 1). Therefore, be sure to check that fetching is not in progress before issuing a request.

Writing to a bit of this register is only possible when the current operating mode is operation mode. Only 1 can be written to this bit.

46.2.5 Current Descriptor Address Register q (CDARq) (q = 0 to 21)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CDARq register indicates the current descriptor address.

CDAR0 to CDAR3 indicate the addresses of the current descriptors for the corresponding transmission queues while CDAR4 to CDAR21 indicate the addresses of the current descriptors for the corresponding reception queues.

If the operating mode is changed to operation mode, the contents of the register for the queue to be used are set in the descriptor base address table register (DBAT).

Also, when the descriptor base address load request register (DLR) issues a load request, the contents of the descriptor base address table register (DBAT) are set in to the corresponding CDAR registers.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|

| | TDM | B'0 | R/W | Tx clock internal Delay Mode [RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N] This bit can add internal Tx clock delay typ 2.0ns*. 0: normal mode 1: Setting prohibited * Refer to Electrical Characteristics for details. |
| 13 | RDM | B'0 | R/W | Rx clock internal Delay Mode This bit can add internal Rx clock delay typ 1.8ns*. 0: normal mode 1: delayed mode * Refer to Electrical Characteristics for details. |
| 12 to 5 | — | All 0 | R/W | Reserved These bits are read as 0. |
| 4 | CMSW | B'0 | R/W | select width of internal compare match signal 0: 1clock period pulse 1: 4clock period pulse |
| 3 to 0 | — | B'0000 | R/W | Reserved These bits are read as 0. |

46.2.8 Receive Configuration Register (RCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RCR register is used to make settings related to reception for the AVB-DMAC.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 29 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 28 to 16 | RFCL[12:0] | H'1800 | R/W | Receive FIFO Caution Level These bits set the caution level for the reception FIFO and are used to maintain the priority order of the storage of received data and the fetching of data for transmission. If the reception FIFO contains less data than this level, processing of both transmission and reception queues becomes pending. If the reception FIFO contains more data than this level, only data in the reception queue are transferred, and processing of the transmission queue becomes pending. Writing to this bit is only possible when the current operating mode is configuration mode. Recommended value: H'1800 Notes: <ul style="list-style-type: none"> The setting of this bit must be a multiple of four (i.e. set RFCL[1:0] = B'00). In the case of this LSI chip, set these bits to H'1800. |
| 15 to 6 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 5 | ETS2 | B'0 | R/W | Time Stamp Enable (Stream) Enables the inclusion of time-stamp information in reception queues 2 to 17. Writing to this bit is only possible when the current operating mode is configuration mode. 0: Time stamping is disabled. 1: Time stamping is enabled. Recommended value: 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|---|
| 4 | ETS0 | B'0 | R/W | <p>Time Stamp Enable (Best Effort)</p> <p>Enables the inclusion of time-stamp information in reception queue 0.</p> <p>Writing to this bit is only possible when the current operating mode is configuration mode.</p> <p>0: Time stamping is disabled.</p> <p>1: Time stamping is enabled.</p> <p>Recommended value: 0</p> |
| 3, 2 | ESF[1:0] | B'00 | R/W | <p>Stream Filtering Select</p> <p>Settings for reception queues 2 to 17.</p> <p>These bits select separation filtering for reception queues 2 to 17. The queue-dependent separation filter can be used in combination with the identification of AVB stream frames.</p> <p>When the value is B'00, filtering is disabled and frames from streams are processed in reception queue 0 (best effort).</p> <p>When the value is B'01, the separation filter is enabled for both AVB stream frames and non-AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).</p> <p>When the value is B'10, the separation filter is enabled for AVB stream frames; frames from non-matching streams are discarded.</p> <p>When the value is B'11, the separation filter is enabled for AVB stream frames; frames from non-matching streams are processed in reception queue 0 (best effort).</p> <p>For separation filtering, see section 46.3.4(1)(a) Separation Filtering.</p> <p>Writing to this bit is only possible when the current operating mode is configuration mode.</p> <p>B'00: Filtering is disabled. Frames are processed in queue 0 (best effort).</p> <p>B'01: The filter for both AVB stream frames and non-AVB stream frames is enabled; non-matching frames from the stream are processed in queue 0 (best effort).</p> <p>B'10: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames are discarded.</p> <p>B'11: The filter for separating AVB stream frames from non-AVB stream frames is enabled; non-matching frames from a stream are processed in queue 0 (best effort).</p> <p>Recommended value: B'10 or B'11</p> |
| 1 | ENCF | B'0 | R/W | <p>Network Control Filtering Enable</p> <p>Setting for reception queue 1 (network control)</p> <p>Enables the AVB network control frame for reception queue 1.</p> <p>When reception queue 1 is disabled, a received frame is stored in reception queue 0 (best effort).</p> <p>Writing to this bit is only possible when the current operating mode is configuration mode.</p> <p>0: Network control is disabled.</p> <p>1: Network control is enabled.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 0 | EFFS | B'0 | R/W | <p>Error Frame Enable</p> <p>Enables or disables the reception of frames that have been classified as error frames by the E-MAC.</p> <p>Received error frames are stored in reception queue 0 (best effort).</p> <p>An indicator of error detection by the E-MAC during reception is stored in the descriptor (DESCR.MS).</p> <p>Writing to this bit is only possible when the current operating mode is configuration mode.</p> <p>0: Error frames are disabled.</p> <p>1: Error frames are enabled.</p> <p>Recommended value: 0</p> |

46.2.9 Receive Queue Configuration Register i (RQCi) (i = 0 to 4)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

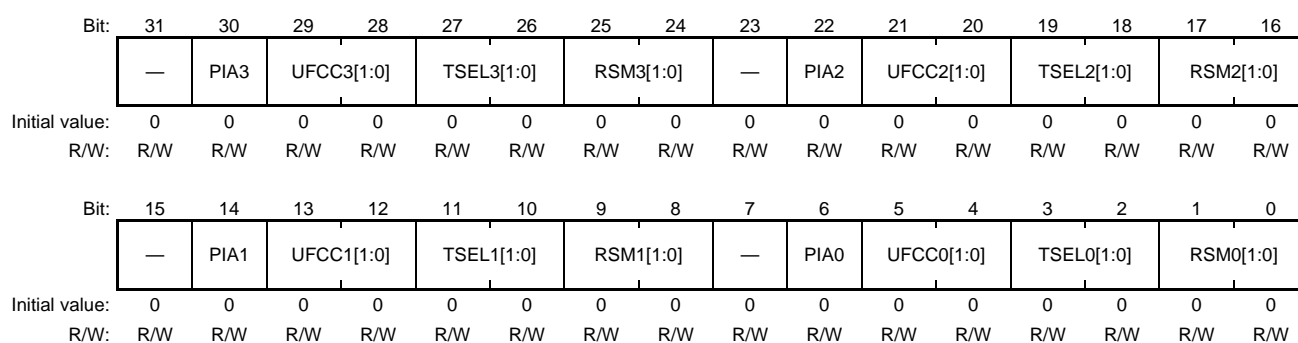

The RQC0 register is used to set up reception queues 0 to 3.

The RQC1 register is used to set up reception queues 4 to 7.

The RQC2 register is used to set up reception queues 8 to 11.

The RQC3 register is used to set up reception queues 12 to 15.

The RQC4 register is used to set up reception queues 16 to 17.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|------------|---------------|-----|--|
| 31 | — | B'0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 30 | PIA3 | B'0 | R/W | Packed Incremental data Area (Receive Queue 3 + i × 4) This bit defines how addresses inside the incremental data area of queue 3 + i × 4 are handled. When this bit is 0, frame data in incremental data area starts always at a 32 bit address. Depending on received frame length there are up to 3 undefined bytes between two frames in URAM. When this bit is 1, there will no gaps generated between two frames in incremental data area. The CPU can only write to this bit if CSR.OPS is CONFIG. 0: Frame data starts always 32 bit aligned 1: No gaps between frame data in incremental data area |
| 29, 28 | UFCC3[1:0] | B'00 | R/W | Unread Frame Counter Configuration (Receive Queue 3 + i × 4) These bits set the unread frame counter used in reception queue 3 + i × 4. With the AVB-DMAC, four patterns of settings are available for the unread frame counter. Use the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) to set the warning level and stop level of the unread frame counter. Set the pattern number 3 set in the unread frame counter warning level configuration register (UFCW) and unread frame counter stop level configuration register (UFCS) in this bit. When the value is B'00, the stop function is disabled. Writing to the bits is only possible when the current operating mode is configuration mode. |

46.2.10 Receive Padding Configuration Register (RPC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RPC register is used to set padding for received frames.

Note: Padding can be used to extend frame lengths, but frame lengths should not exceed 4 Kbytes.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 24 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 23 to 16 | DCNT[7:0] | H'00 | R/W | Stored Data Counter These bits specify the amount of the frame data (1 to 255) to be stored following the padding. Counting by one indicates one word (4 bytes). For example, when these bits are set to 47, the amount of data is 47 words (= 188 bytes). When these bits are 0, all received data have been stored following the initial padding. Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 46.3.4(3)(b) Incremental Data Areas. |
| 15 to 11 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 10 to 8 | PCNT[2:0] | B'001 | R/W | Stored Padding Counter These bits specify the amount of padding to be appended to the URAM. Counting by one indicates one word (4 bytes). For example, when these bits are set to 1, the amount of padding is one word (= 4 bytes). Writing to the bits is only possible when the current operating mode is configuration mode. For details on padding, see section 46.3.4(3)(b) Incremental Data Areas. The CPU should not write 0 to these bits. |
| 7 to 0 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

46.2.11 Reception Truncation Configuration register (RTC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RTC register is used to set Maximum Number of bytes stored per received frame.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 28 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 27 to 16 | MFL1[11:0] | H'FFC | R/W | Maximum Frame Length 1 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 1 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is B'1000). Additionally the DESCR.TI in the updated descriptor is set to 1. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then SFO.FBP + 8 to these bits when RCR.ESF is not equal to B'00. |
| 15 to 12 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 11 to 0 | MFL0[11:0] | H'FFC | R/W | Maximum Frame Length 0 These bits define the maximum frame length (64 to 4092 bytes) stored to URAM. For each receive queue one parameter 0 used for truncation is selected. When a frame received by E-MAC is truncated, CPU gets informed by EIS.QEF and frame size error (ESR.ET is B'1000). Additionally the DESCR.TI in the updated descriptor is set to 1. The CPU can only write to these bits if CSR.OPS is CONFIG. The CPU should only write values which are a multiple of 4 to these bits. The CPU should not write values less than 64 to these bits. The CPU should not write values less then SFO.FBP + 8 to these bits when RCR.ESF is not equal to B'00. |

46.2.12 Unread frame counter warning level register (UFCW)

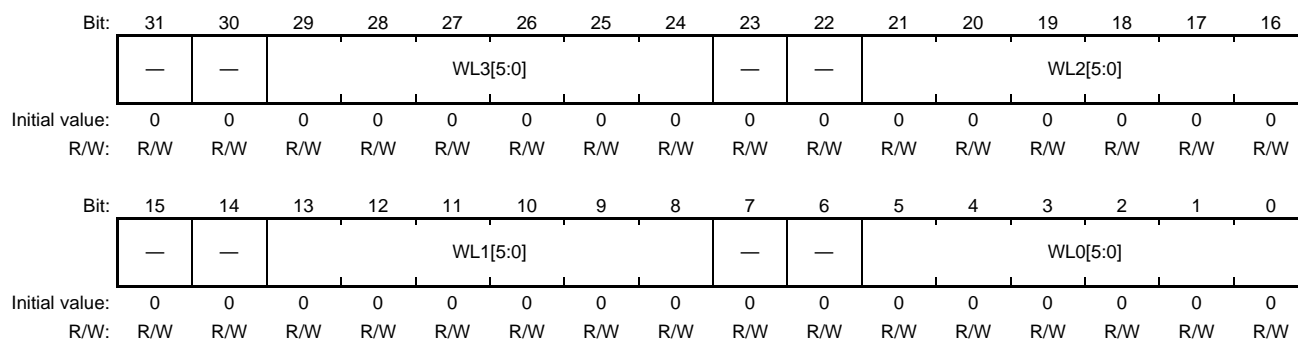

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The UFCW register sets the warning levels for the number of unread frames.

One of the four warning levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) (i = 0 to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

The CPU should not write 63 to these bits.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31, 30 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 29 to 24 | WL3[5:0] | B'00_0000 | R/W | Warning Level 3 Unread frame count warning level 3 |
| 23, 22 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 21 to 16 | WL2[5:0] | B'00_0000 | R/W | Warning Level 2 Unread frame count warning level 2 |
| 15, 14 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 13 to 8 | WL1[5:0] | B'00_0000 | R/W | Warning Level 1 Unread frame count warning level 1 |
| 7, 6 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 5 to 0 | WL0[5:0] | B'00_0000 | R/W | Warning Level 0 Unread frame count warning level 0 |

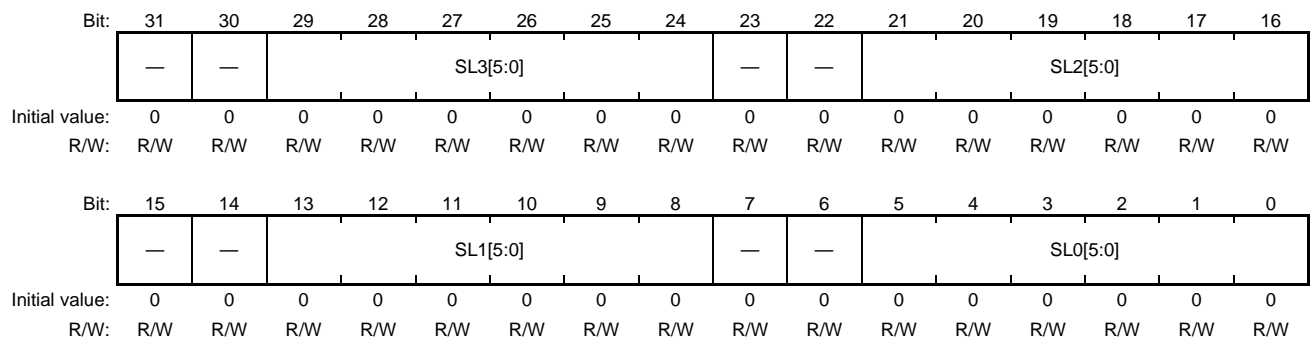

46.2.13 Unread frame counter stop level register (UFCS)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The UFCS register sets the stop levels for unread frames.

One of the four stop levels from 0 to 3 can be set for each reception queue. When these bits are set to 0, the stop function is disabled. The level to be used is specified by the receive queue configuration register i (RQCi) ($i = 0$ to 4).

Writing to the bits is only possible when the current operating mode is configuration mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31, 30 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 29 to 24 | SL3[5:0] | B'00_0000 | R/W | Stop Level 3 Unread frame count stop level 3 |
| 23, 22 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 21 to 16 | SL2[5:0] | B'00_0000 | R/W | Stop Level 2 Unread frame count stop level 2 |
| 15, 14 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 13 to 8 | SL1[5:0] | B'00_0000 | R/W | Stop Level 1 Unread frame count stop level 1 |
| 7, 6 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 5 to 0 | SL0[5:0] | B'00_0000 | R/W | Stop Level 0 Unread frame count stop level 0 The CPU can only write 0 |

46.2.14 Unread Frame Counter Register i (UFCVi) (i = 0 to 4)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The UFCV0 register indicates the number of unread frames in reception queues 0 to 3.

The UFCV1 register indicates the number of unread frames in reception queues 4 to 7.

The UFCV2 register indicates the number of unread frames in reception queues 8 to 11.

The UFCV3 register indicates the number of unread frames in reception queues 12 to 15.

The UFCV4 register indicates the number of unread frames in reception queues 16 and 17.

For a description of how to use unread frames, refer to section 46.3.4 (4), Unread Frame Counters.

Conditions for updating:

The bits are set to 0 when the operating mode is not operation mode and when the descriptor base address load request register (DLR) issues a base address load request.

The number is incremented when data received in reception queue r are stored normally. The maximum increment is H'3F. If the value exceeds H'3F, incrementation will not proceed.)

The number is decremented by the value written to the unread frame counter decrement register i (UFCDi).

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31, 30 | — | All 0 | R | Reserved These bits are read as 0. |
| 29 to 24 | CV3[5:0] | B'00_0000 | R | Unread Frame Count 3 + 4 × i Number of unread frames in reception queue 3 + 4 × i |
| 23, 22 | — | All 0 | R | Reserved These bits are read as 0. |
| 21 to 16 | CV2[5:0] | B'00_0000 | R | Unread Frame Count 2 + 4 × i Number of unread frames in reception queue 2 + 4 × i |
| 15, 14 | — | All 0 | R | Reserved These bits are read as 0. |
| 13 to 8 | CV1[5:0] | B'00_0000 | R | Unread Frame Count 1 + 4 × i Number of unread frames in reception queue 1 + 4 × i |
| 7, 6 | — | All 0 | R | Reserved These bits are read as 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 5 to 0 | CV0[5:0] | B'00_0000 | R | Unread Frame Count 0 + 4 × i Number of unread frames in reception queue 0 + 4 × i |

46.2.15 Unread Frame Counter Decrement Register i (UFCDi) (i = 0 to 4)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The UFCD0 register is used to decrement unread counters in reception queues 0 to 3.

The UFCD1 register is used to decrement unread counters in reception queues 4 to 7.

The UFCD2 register is used to decrement unread counters in reception queues 8 to 11.

The UFC register is used to decrement unread counters in reception queues 12 to 15.

The UFCD4 register is used to decrement unread counters in reception queues 16 and 17.

Write H'3F to these bits to reset the unread counters in reception queue r (r = 0 to 17). These bits are always read as 0.

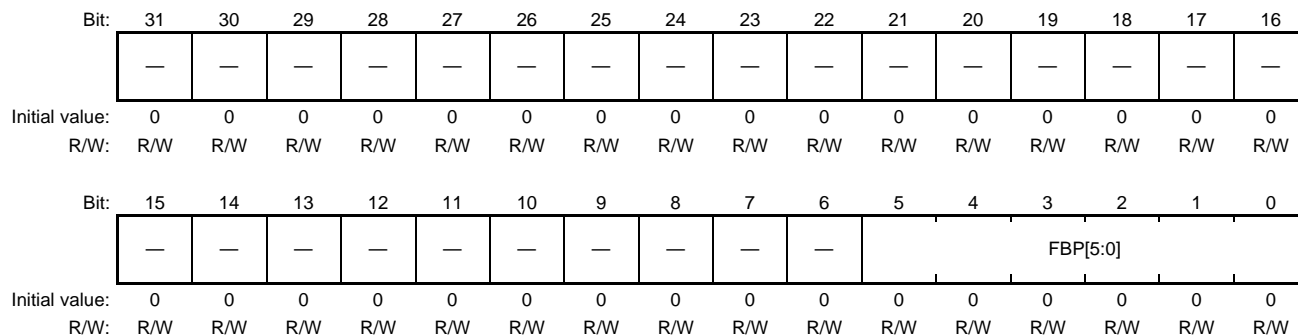

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31, 30 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 29 to 24 | DV3[5:0] | B'00_0000 | R/W | Unread Frame Decrement Value $3 + 4 \times i$ Unread frame decrement value for reception queue $3 + 4 \times i$ |
| 23, 22 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 21 to 16 | DV2[5:0] | B'00_0000 | R/W | Unread Frame Decrement Value $2 + 4 \times i$ Unread frame decrement value for reception queue $2 + 4 \times i$ |
| 15, 14 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 13 to 8 | DV1[5:0] | B'00_0000 | R/W | Unread Frame Decrement Value $1 + 4 \times i$ Unread frame decrement value for reception queue $1 + 4 \times i$ |
| 7, 6 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 5 to 0 | DV0[5:0] | B'00_0000 | R/W | Unread Frame Decrement Value $0 + 4 \times i$ Unread frame decrement value for reception queue $0 + 4 \times i$ |

46.2.16 Separation Filter Offset Register (SFO)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The SFO register sets an offset into frames for use by the separation filter.

Note: Received frames having fewer bytes than the setting of these bits + 8 bytes are judged to be non-matching by the separation filter. In this case, the data will either be sorted into a reception queue or discarded in accord with the setting of the separation filtering select bits in the receive configuration register (RCR.ESF).

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 6 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 5 to 0 | FBP[5:0] | B'00_0000 | R/W | First Byte Position These bits set the position in Ethernet frames of the first byte of the bytes to be used by the separation filter. When these bits are 0, the separation filter starts from the start of each Ethernet frame (first byte of the destination address). For bytes in Ethernet frames, see Figure 46.2 Operating Mode of AVB-DMAC, in section 46.3.1(1) Operating Modes. Writing to the bits is only possible when the current operating mode is configuration mode. [Changing condition] These bits are updated to the value of SFVi.LV[5:0] when SFL.LC changes from 30 (Load SFO.FBP) to 31 while CSR.OPS is OPERATION. For separation filtering, see section 46.3.4(1)(a) Separation Filtering. |

46.2.17 Separation Filter Pattern Register i (SFPi) (i = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

A pair of SFPi registers set the pattern for the separation filters to be used by the corresponding reception queues 2 to 17 (for streams 0 to 15).

Each queue shares a 64-bit setting; reception queue 2 (for stream 0) uses SFP0 and SFP1, reception queue 17 (for stream 15) uses SFP30 and SFP31, and so on.

The separation filter passes a frame when, after masking by the mask value set in the separation filter mask register (SFMi), data from received frames match the value defined in these bits.

SFPi.FP[7:0] (where i is an even number) are used for the byte of Ethernet frame data specified by the separation filter offset register, while SFPi.FP[63:56] (where i is the corresponding odd number) are used for the byte at the address specified by the separation filter offset register (SFO) + 7.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of SFVi.LV[63:0] when SFL.LC changes from s (Load SFPi.FPs) to 31 while CSR.OPS is OPERATION.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | FP[31:0] | H'0000_0000 | R/W | Separation Filter Pattern These bits set the pattern of the separation filter. The 64-bit filter pattern is set for each queue. |

46.2.18 Separation Filter Value register i (SFVi) (i = 0 to 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

These bits define the 64 bit value to be loaded for separation filtering.

When loading the first by position (SFO.FBP), SFVi.LV[63:6] are ignored.

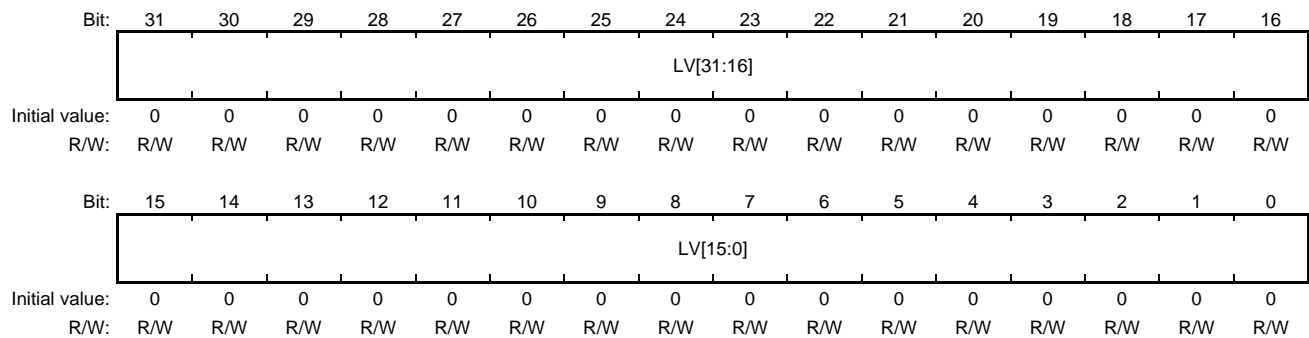

The CPU can only write to these bits if CSR.OPS is OPERATION.

The CPU can only write to these bits if SFL.LC is 31.

[Changing condition]

These bits are set to 0 when leaving OPERATION mode.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | LV[31:0] | H'0000_0000 | R/W | Separation Filter Value These bits set the Load value of the separation filter. |

46.2.19 Separation Filter Mask Register i (SFMi) (i = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

A pair of SFMi registers sets the mask value for the separation filter used by the corresponding reception queue 2 to 17 (stream 0 to 15).

SFM0.CFM[7:0] are used for bytes of Ethernet frame data specified by the separation filter offset register, while SFM1.CFM[63:56] are used for the separation filter offset register (SFO) + 7.

Frame data at the positions of mask bits that are set to 0 are masked; that is, they do not affect pattern-matching by the separation filter.

Writing to the bits is only possible when the current operating mode is configuration mode.

[Changing condition]

These bits are updated to the value of SFVi.LV[63:0] when SFL.LC changes from 29 (Load SFMi.CFM) to 31 while CSR.OPS is OPERATION.

For separation filtering, see section 46.3.4(1)(a) Separation Filtering.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 0 | CFM[31:0] | H'0000_0000 | R/W | Separation Filter Mask These bits set the mask value for the separation filter. |

46.2.20 Separation Filter Load register (SFL)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The SFL register is used to separation filter load.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 4 to 0 | LC[4:0] | H'1F | R/W | Load Command These bits control update of separation filter configuration in OPERATION mode. By writing 30 to these bits CPU triggers an update of First Byte Position (SFO.FBP) value. By writing 29 to these bits CPU triggers an update of Common Filter Mask (SFMi.CFM) value. By writing number between 0 and 15 to these bits CPU triggers an update of Filter Pattern s (SFPI.FPs) value. The number written to SFL.LC defines the index s of the updated Filter Pattern. The CPU can only write to these bits if CSR.OPS is OPERATION. The CPU can only write to these bits if SFL.LC is 31. [Changing condition] These bits are set to 31 when leaving OPERATION mode. These bits are set to 31 when the requested update has been processed. 0-15: Load of SFPI.FPs with s = SFL.LC 16-28: Invalid 29: Load of SFMi.CFM 30: Load of SFO.FBP 31: No pending load request |

46.2.21 Current Incremental Address Register r (CIARr) (r = 0 to 17)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CIARr register is used to check queue address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 0 | CIA[31:0] | H'0000_0000 | R | <p>Current incremental address used by receive queue</p> <p>These bits indicate the incremental address of receive queue r, where currently frame data is stored or where frame data will be stored when queue r gets active.</p> <p>Refer to section 46.3.4(3)(b) Incremental Data Areas.</p> <p>[Changing condition]</p> <p>These bits are set to 0 when leaving OPERATION mode.</p> <p>These bits are updated to next address in incremental data area when processing a FEMPTY_IS or FEMPTY_IC descriptor.</p> |

46.2.22 Last Incremental Address Register r (LIARr) (r = 0 to 17)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The LIARr register is used to check queue address.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 0 | LIA[31:0] | H'0000_0000 | R | <p>Last incremental address used by receive queue</p> <p>These bits indicate the current incremental address of receive queue r (CIARr.CIA) before its address was updated due to processing a FEMPTY_IS descriptor. So it describes the first not used address inside the incremental data area of receive queue r. Refer to section 46.3.4(3)(b) Incremental Data Areas.</p> <p>[Changing condition]</p> <p>These bits are set to 0 when leaving OPERATION mode.</p> <p>These bits are set to CIARr.CIA when processing a FEMPTY_IS descriptor.</p> |

46.2.23 Transmit Configuration Register (TGC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TGC register is used to make settings related to transmission for the AVB-DMAC.

| | | | | | | | | | | | | | | | | |

46.2.24 Transmit Configuration Control Register (TCCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TCCR register controls transmission by the AVB-DMAC and is used to make related settings.

Conditions for updating:

The bit is set to 0 when the operating mode is not operation mode, when a descriptor of type EEMPTY, FEMPTY or LEMPTY (no usable data) is processed, when an EOS descriptor is processed, and when a descriptor with defective data is processed.

| | | | | | | | | | | | | | | | | |

46.2.26 E-MAC status FIFO Access register (MFA)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The MFA register indicates the state of MAC.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 26 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 25 to 16 | MST[9:0] | H'000 | R | Tag number from descriptor identifying the frame E-MAC status relation E-MAC Status Tag These bits represent the DESCR.TAG bits from the descriptor defining the data for frame transmission. The tag is used to get the relation between the frame inside a transmit queue and the E-MAC status available in the FIFO (MFA.MSV). The CPU should not read these bits when TSR.MFFL is 0. [Changing condition] These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1). These bits are updated when the oldest entry is released (writing 1 to TCCR.MFR). These bits are updated when the FIFO is overwritten (a frame with DESCR.MSR in descriptor has been transmitted by MAC, TCCR.MFEN is 1 and TSR.MFFL is 16). These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and TSR.MFFL is 16). <i>Note for verification: These bits are set to 0 when leaving OPERATION mode.</i> |
| 15 to 4 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 3 to 0 | MSV[3:0] | H'0 | R | <p>E-MAC Status Value</p> <p>These bits represent the E-MAC status bits as stored in the oldest E-MAC status FIFO entry.</p> <p><i>MSV[3] Reserved</i></p> <p><i>MSV[2] Carrier lost during frame transmission</i></p> <p><i>MSV[1] Delay collision</i></p> <p><i>MSV[0] Transmission time out</i></p> <p>The CPU should not read these bits when TSR.MFFL is 0.</p> <p>[Changing condition]</p> <p>These bits are updated when the first entry is stored in FIFO (TSR.MFFL changes from 0 to 1).</p> <p>These bits are updated when the oldest entry is released (writing 1 to TCCR.MFR).</p> <p>These bits are updated when the FIFO overwritten (a frame with DESCR.MSR in descriptor has been transmitted by E-MAC, TCCR.MFEN is 1 and TSR.MFFL is 16).</p> <p>These bits are updated when the FIFO is overwritten (E-MAC detects an error during transmission and TSR.MFFL is 16).</p> <p><i>Note for verification: These bits are set to 0 when leaving OPERATION mode.</i></p> |

46.2.27 Time Stamp FIFO Access Register 0 (TFA0)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

TFA0 indicates the nano seconds portion of the timestamp value.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 0 | TSV[31:0] | H'0000_0000 | R | <p>Time Stamp Value</p> <p>These 80 bits consist of TFA0.TSV[31:0], TFA1.TSV[63:32], and TFA2.TSV[79:64], which together indicate the oldest time stamp value stored in the time-stamp FIFO.</p> <p>Once the time-stamp FIFO is full, no further time-stamp values are stored.</p> <p>Conditions for updating:</p> <ul style="list-style-type: none"> The bits are set to H'0000_0000 when the operating mode is not operation mode. The register is updated whenever a value is stored in the time-stamp FIFO (when the time-stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). The register is updated when the oldest entry is released (when the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR) is set to 1). |

46.2.28 Time Stamp FIFO Access Register 1 (TFA1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TFA1 register indicates the lower seconds portion of the timestamp value.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | TSV[63:32] | H'0000_0000 | R | Time Stamp Value For details, see section 46.2.28 Time Stamp FIFO Access Register 0 (TFA0). |

46.2.29 Time Stamp FIFO Access Register 2 (TFA2)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TFA2 register indicates the timestamp tag and the higher seconds portion of the timestamp value.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 26 | — | All 0 | R | Reserved These bits are read as 0. |
| 25 to 16 | TST[9:0] | H'000 | R | Time Stamp Tag These bits indicate the contents of the DESCR.TAG bit within the descriptor for frame transmission. These values are used to check the correlation between frames within the transmission queue and the time-stamp values (accessible through time stamp FIFO access register i (TFAi)) which can be placed in the FIFO. For the tagging of frames in transmission, see section 46.3.5(4) Time Stamping in Transmission. Conditions for updating: <ul style="list-style-type: none"> The bits are set to H'000 when the operating mode is not operation mode. Updated when a value is stored in the time-stamp FIFO (when the value of the time stamp FIFO count bit in the transmit status register (TSR.TFFL) changes from 0 to 1). Updated when the oldest entry has been released (1 is set in the time stamp FIFO release bit in the transmit configuration control register (TCCR.TFR)). |
| 15 to 0 | TSV[79:64] | H'0000 | R | Time Stamp Value For details, see section 46.2.28 Time Stamp FIFO Access Register 0 (TFA0). |

46.2.30 Version and Release Register (VRR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

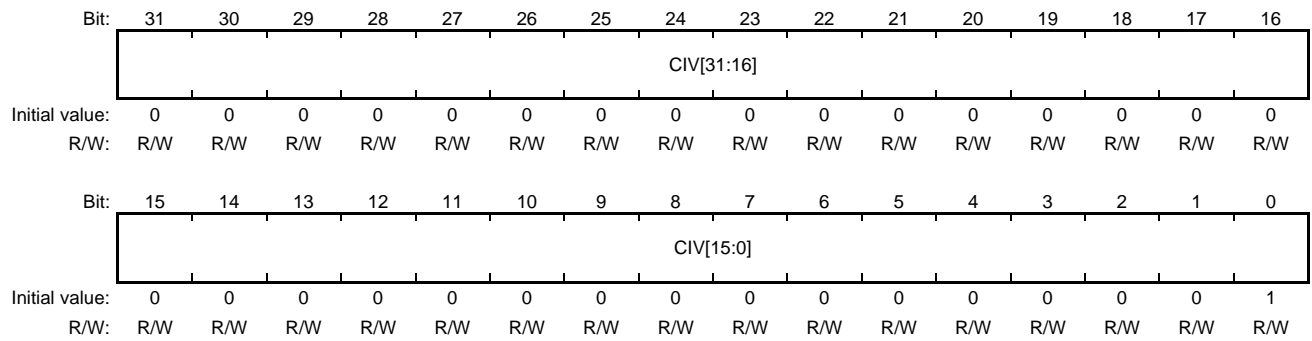

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | VC[31:0] | H'0000_E300 | R | Version Code These bits identify the version of used EthernetAVB-IF. |
| | | | | H'0000_E300: RAVBES3 |

46.2.31 CBS Increment Value Register c (CIVRc) (c = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CIVR0 register sets the increment in the CBS algorithm for transmission queue 2 (for stream class B).

The CIVR1 register sets the increment in the CBS algorithm for transmission queue 3 (for stream class A).

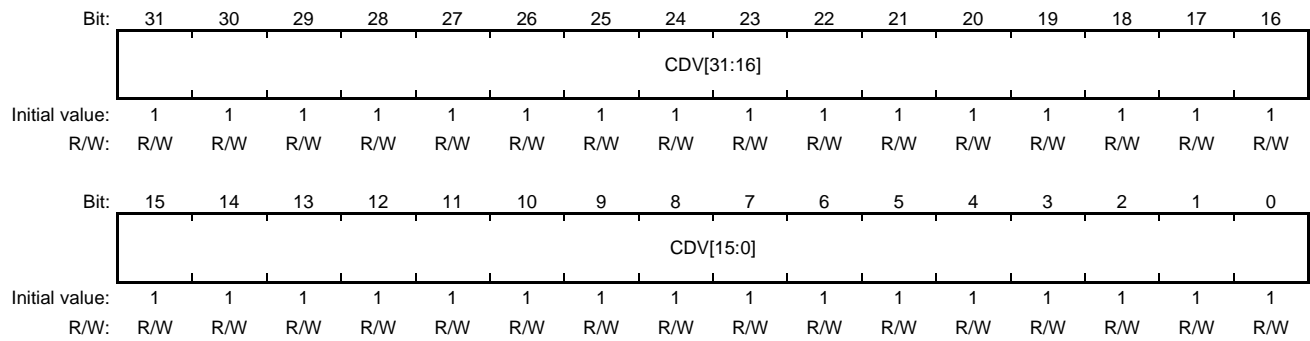

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 0 | CIV[31:0] | H'0000_0001 | R/W | <p>CBS Increment Value</p> <p>CBS increment value (1 to H'FFFF)</p> <p>These bits define the increment value related to idleSlope for the CBS algorithm.</p> <p>Set a value in the range from H'0000_0001 to H'0000_FFFF.</p> <p>The value to be written to these bits depends on the Ethernet bit rate and HPφ (high-speed peripheral clock). For details, see section 46.3.6 CBS (Credit-Based Shaping).</p> <p>Note: When write to these bits, corresponding queue's credits are cleared to 0 respectively.</p> |

46.2.32 CBS Decrement Value Register c (CDVRC) (c = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CDVR0 register sets the decrement in the CBS algorithm for transmission queue 2 (for stream class B).

The CDVR1 register sets the decrement in the CBS algorithm for transmission queue 3 (for stream class A).

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 0 | CDV[31:0] | H'FFFF_FFFF | R/W | <p>CBS Decrement Value</p> <p>Setting value: -1 to -65536 (H'FFFF_FFFF to H'FFFF_0000)</p> <p>These bits set the decrement for the CBS algorithm.</p> <p>These bits define the decrement value related to sendSlope for CBS algorithm.</p> <p>The value to be written to these bits depends on the Ethernet bit rate and HPφ (high-speed peripheral clock). For details, see section 46.3.6 CBS (Credit-Based Shaping).</p> <p>Note: When write to these bits, corresponding queue's credits are cleared to 0 respectively.</p> |

46.2.33 CBS Upper Limit Register c (CULc) (c = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CUL0 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the upper limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|----------|---|
| 31 to 0 | ULV[31:0] | H'7FFF_FFFF | R/W * | <p>CBS Upper Limit</p> <p>These bits set the upper limit for credit values calculated by using the CBS algorithm.</p> <p>The setting is a limiting value for error detection and does not normally affect operation of the algorithm.</p> <p>Write a positive value to these bits.</p> <p>For details, see section 46.3.6 CBS (Credit-Based Shaping).</p> |

Note: * Bit 31 is read only.

46.2.34 CBS Lower Limit Register c (CLLc) (c = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CUL0 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 2 (for stream class B).

The CUL1 register sets the lower limit for credit values calculated by using the CBS algorithm for transmission queue 3 (for stream class A).

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|------|---|
| 31 to 0 | LLV[31:0] | H'8000_0001 | R/W* | <p>CBS Lower Limit</p> <p>These bits set the lower limit for credit values calculated by using the CBS algorithm.</p> <p>The setting is a limiting value for error detection and does not normally affect operation of the algorithm.</p> <p>Write a negative value to these bits.</p> <p>For details, see section 46.3.6 CBS (Credit-Based Shaping).</p> |

Note: * Bit 31 is read only.

46.2.35 Descriptor Interrupt Control Register (DIC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The DIC register is used to control descriptor interrupts 1 to 15.

When an interrupt source flag is set (a bit from DPF1 to DPF15 bits in the descriptor interrupt status register (DIS) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0 when writing 1 to DID.DPDi.

This bit is set to 1 when writing 1 to DIE.DPSi.

| | | | | | | | | | | | | | | | | |
|----------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|------|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 1 | DPF1 | B'0 | R/W | Descriptor Interrupt Status1 0: The interrupt is not pending. 1: The interrupt is pending. |
| 0 | — | B'0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

DPF1 to DPF15 Descriptor Interrupt Status Bits:

When DESC.R.DIE is 1 to 15, the corresponding bit indicates completion of the processing of a descriptor within the reception or transmission queue.

When DESC.R.DIE is 0, the descriptor interrupt is not generated.

When DESC.R.DIE is 0001b, in addition a queue specific descriptor interrupt is generated.

Only 0 can be written to these bits.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when a descriptor with DESC.R.DIE set to the corresponding number from 1 to 15 is processed.

46.2.37 Error Interrupt Control Register (EIC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The EIC register controls the AVB-DMAC-related error interrupts.

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 17 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 16 | QFS | B'0 | R/W | Queue Full Error Interrupt Status With the interrupts enabled, this bit indicates that a queue is full (the receive queue r full interrupt status bit (QFFr) or the receive FIFO full interrupt status bit (RFFF) in receive interrupt status register 2 (RIS2) = 1). [Conditions for Changing] — If the receive queue r full interrupt status bit (RIS2.QFFr) and/or the receive queue r full interrupt enable bit in the - receive interrupt control register 2 (RIC2.QFEr) are updated, this bit is also updated. — If the receive FIFO full interrupt status bit (RIS2.RFFF) and/or the receive FIFO full interrupt enable bit (RIC2.RFFE) are updated, this bit is also updated. 0: The interrupt is not pending. 1: The interrupt is pending. |
| 15 to 11 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 10 | TBFF | B'0 | R/W | Tx-Buffer Full Flag This bit indicates that fetching transmit data was delayed because the Tx-Buffer has no sufficient storage available to store fetched frame. It depends on configuration of TGC.TBDt (refer to section 46.3.5(1)) if a full Tx-Buffer is expected during normal operation. No frame gets lost but transmission priority may be influenced. The CPU can only write 0 to this bit. [Changing condition] This bit is set to 0 when leaving OPERATION mode. This bit is set to 1 when frame data has been fetched from URAM but there is no storage available in Tx-Buffer. 0: No interrupt pending 1: Tx-Buffer full condition detected |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 9 | MFFF | B'0 | R/W | <p>E-MAC status FIFO Full Flag</p> <p>This bit indicates that a transmission E-MAC status is overwritten because the E-MAC status FIFO is full (overwrite condition). The CPU can only write 0 to this bit.</p> <p>[Changing condition]</p> <p>This bit is set to 0 when leaving OPERATION mode.</p> <p>This bit is set to 1 when a frame with DESCR.MSR has been transmitted by E-MAC, TCCR.MFEN is 1 and TSR.MFFL is 16.</p> <p>This bit is set to 1 when E-MAC detects an error during transmission and TSR.MFFL is 16.</p> <p>0: No interrupt pending 1: E-MAC status FIFO full, oldest E-MAC status lost</p> |
| 8 | TFFF | B'0 | R/W | <p>Time Stamp FIFO Full Error Interrupt Status</p> <p>This bit indicates that a new transmission time stamp has been discarded due to the time-stamp FIFO being full (i.e. has reached the overflow state).</p> <p>Only 0 can be written to the bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when a frame with DESCR.TSR set is transmitted while the time stamp FIFO enable bit in the transmit configuration control register (TCCR.TFEN) is set to 1 and the time stamp FIFO count bit in the transmit status register (TSR.TFFL) is set to 3. <p>0: The interrupt is not pending. 1: The interrupt is pending.</p> |
| 7 | CULF1 | B'0 | R/W | <p>CBS Upper Limit Error Interrupt Status (Class A)</p> <p>This bit indicates that CBS counter 1 has exceeded the set upper limit (CUL1.ULV in the CBS upper limit register c (CULc)).</p> <p>Only 0 can be written to the bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — This bit is set to 0 when the operating mode is not operation mode. — This bit is set to 1 when the value of the CBS counter status 1 (Class A) bits in the transmit status register (TSR.CCS1) change from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). <p>0: The interrupt is not pending. 1: The interrupt is pending.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 6 | CULF0 | B'0 | R/W | <p>CBS Upper Limit Error Interrupt Status (Class B)</p> <p>This bit indicates that CBS counter 0 has exceeded the set upper limit (CUL0.ULV in the CBS upper limit register c (CULc)).</p> <p>Only 0 can be written to the bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — The bit is set to 0 when the operating mode is not operation mode. — The bit is set to 1 when the value of the CBS counter status 0 (Class B) bit in the transmit status register changes from B'00 (indicating a value within the range between the limits) to B'10 (indicating a value over the upper limit). <p>0: The interrupt is not pending. 1: The interrupt is pending.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 0 | MREF | B'0 | R/W | <p>E-MAC Reception Error Flag</p> <p>This bit indicates that the E-MAC has detected a fault during reception.</p> <p>For detail, the E-MAC registers have to be checked.</p> <p>Note: When the storage of faulty received frames (RCR.EFFS) is enabled, the E-MAC error code (DESCR.MSC) is stored in the descriptor. By evaluating this information, CPU can identify corrupted frames in URAM.</p> <p>The CPU can only write 0 to this bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none">— This bit is set to 0 when leaving operating mode.— This bit is set to 1 when E-MAC detects an error during frame reception. <p>0: No interrupt pending.</p> <p>1: E-MAC has reported an error during reception.</p> |

46.2.39 Receive Interrupt Control Register 0 (RIC0)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RIC0 register controls the AVB-DMAC receive interrupts.

When an interrupt source flag is set (a bit from among the receive interrupt status bits in the receive interrupt status register (RIS0.FRf0 to 17) = 1) while the interrupt is enabled, the interrupt is issued.

[Changing condition]

This bit is set to 0 when writing 1 to RID0.FRDr.

This bit is set to 1 when writing 1 to RIE0.FRSr.

FRF0 to FRF17 Receive Frame Interrupt Status Bits 0 to 17:

Each bit indicates that a corresponding frame has been stored normally in reception queues 0 to 17 and that data are ready for CPU processing.

Only 0 can be written to the bit.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 0 when a value is written to the unread frame counter decrement register i (UFCD i) ($i = 0$ to 4), and this decrements the value of unread frame counter register i (UFCV i) ($i = 0$ to 4) to 0.
- When a frame is stored normally in a reception queue, the corresponding bit is set to 1.

46.2.41 Receive Interrupt Control Register 1 (RIC1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RIC1 register controls the AVB-DMAC receive interrupts.

QFF0 to 17 Receive 0 to 17 Full Interrupt Status Bits:

These bits indicate that reception queue r did not have space for storing a received frame.

A reception queue is treated as full when it has no descriptors (descriptor type (DESCR.DT) = FEMPTY, FEMPTY_IS, FEMPTY_IC, or FEMPTY_ND) available or reaches the set level for stopping.

Note: If no FEMPTY descriptors or no empty space for descriptors remains in the queue during storing of a divided frame (see section 46.3.4(3)(a) Storing Frame Data in the Descriptor Data Area, for storing a frame as a divided frame), an error frame is stored in the queue. Such error frames are treated as descriptor sequence errors.

[Conditions for Changing]

- A bit is set to 0 when the operating mode is not operation mode.
- A bit is set to 1 when reception queue r has no space available for storage.
- A bit is set to 1 when a SW defined stop point (EOS descriptor) reached within a split frame.
- A bit is set to 1 when the unread frame counter (unread frame counter register i (UFCVi) (i = 0 to 4)) reaches the set level for stopping.

46.2.45 Transmit Interrupt Control Register (TIC)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 20 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 19 | RFFL | B'0 | R/W | Rx-FIFO Full interrupt Line select This bit selects the interrupt line of notification flagged by RIS2.RFFF. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 18 | RFWL | B'0 | R/W | Rx-FIFO Warning interrupt Line select This bit selects the interrupt line of notification flagged by RIS1.RFWF. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 17 | CL0M | B'0 | R/W | Common Line 0 Mode This bit controls if all data related interrupts using a common interrupt line or if queue specific interrupt lines for data related interrupts are used. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). To prevent interrupt notifications on different lines, it is recommended to set all CIE.CTIE, CIE.CRIE, and DIL.DPLi (i = 2 to 15) to 0 when this bit is 0. 0: Use common interrupt line 0 1: Use queue specific interrupt line 0 |
| 16 | RQFM | B'0 | R/W | Reception Queue Full Mode This bit controls if queue full notification is mapped to error interrupt line or to queue data interrupt line. The selected mode has no influence to internal flagging in EthernetAVB-IF register (e.g. ISS). 0: Use for error interrupt line 1: Use for queue specific interrupt line |
| 15 to 9 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

46.2.51 gPTP Configuration Control Register (GCCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GCCR register is used to set and control the gPTP (generalized precision time protocol).

| | | | | | | | | | | | | | | | | |

| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 23 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 22 to 20 | LI[2:0] | B'000 | R/W | Index number of compare unit to be loaded Load Index These bits define the target unit to be updated by GCCR.LPTC. The CPU can only write to these bits if GCCR.LPTC is 0b. |
| 19 | SPC | B'0 | R/W | Start Periodic Comparison This bit defines if the absolute comparison value or the periodicity value is updated to the value of GPTC.PTCV on GCCR.LPTC request. Periodic comparison starts when updating the periodic comparison value; periodic comparison stops when updating the absolute comparison value. The CPU can only write to these bits if GCCR.LPTC is 0b. 0: Absolute comparison value updated by GCCR.LPTC request 1: Periodic comparison value updated by GCCR.LPTC request |
| 18 to 17 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 16 | PGM | B'0 | R/W | Pulse Generation Mode This bit configures if the pulse per second signal (AVB_AVTP_PPS) is derived from the gPTP timer value or the corrected gPTP timer value. A pulse is generated when the second part of the selected timer is incremented. See section 46.3.8(3) Pulse per second. The CPU can only write to this bit if CSR.OPS is CONFIG. The CPU should only change this bit if CCC.GAC is 0b or if increment value used by gPTP timer is 0. 0: Pulse per second is related to gPTP timer value 1: Pulse per second is related to corrected gPTP timer value |
| 15 to 10 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

When read: Completion of settings is pending.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|----------|---------------|-----|---|
| 3 | LTI | B'1 | R/W | <p>Timer Increment Value Configuration Request</p> <p>This bit issues requests for configuring the gPTP timer increment configuration register (GTI).</p> <p>Only 1 can be written to the bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — The bit is set to 1 when the operating mode is not operation mode and CCC.GAC is 0b. — The bit is set to 0 when the value of the gPTP timer increment configuration register (GTI) is loaded. <p>0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.</p> |
| 2 | LTO | B'1 | R/W | <p>Timer Offset Value Configuration Request</p> <p>This bit issues requests for configuring gPTP timer offset configuration register i (GTOi).</p> <p>Only 1 can be written to the bit.</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — The bit is set to 1 when the operating mode is not operation mode and CCC.GAC is 0b. — The bit is set to 0 when the value of gPTP timer offset configuration register i (GTOi) is loaded. <p>0: Setting completed 1: When written: Issue a configuration request. When read: Completion of settings is pending.</p> |
| 1, 0 | TCR[1:0] | B'00 | R/W | <p>Timer Control Request</p> <p>These bits issue requests for controlling the gPTP timer.</p> <p>The source selection (GCCR.TCSS) can be done by same write access.</p> <p>Writing to the bits is only possible when the current operating mode is operation mode, or if CSR.OPS is CONFIG and CCC.GAC is 1.</p> <p>Do not write to the bit when the gPTP timer clock select bit in the AVB-DMAC mode register is B'00. Write to these bits while GCCR.TCR is B'00 or B'10.</p> <p>The CPU should not write other values than B'11 to these bits if GCCR.TCR is B'10.</p> <p>The CPU should only use continuous capture (B'10) for AVTP presentation time value (GCCR.TCSS is B'10).</p> <p>[Conditions for Changing]</p> <ul style="list-style-type: none"> — The bits are set to B'00 when the operating mode is not operation mode and CCC.GAC is 0b. — The bits are also set to B'00 on completion of the requested processing. <p>B'00: Timer control is not requested. B'01: gPTP/AVTP presentation time reset B'10: Continuous capture of AVTP to GCTt.CTV B'11: Captures the value set in the TCSS bit.</p> |

46.2.52 gPTP Maximum Transit Time Configuration Register (GMTT)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GMTT register sets the maximum time for transitions of the gPTP timer.

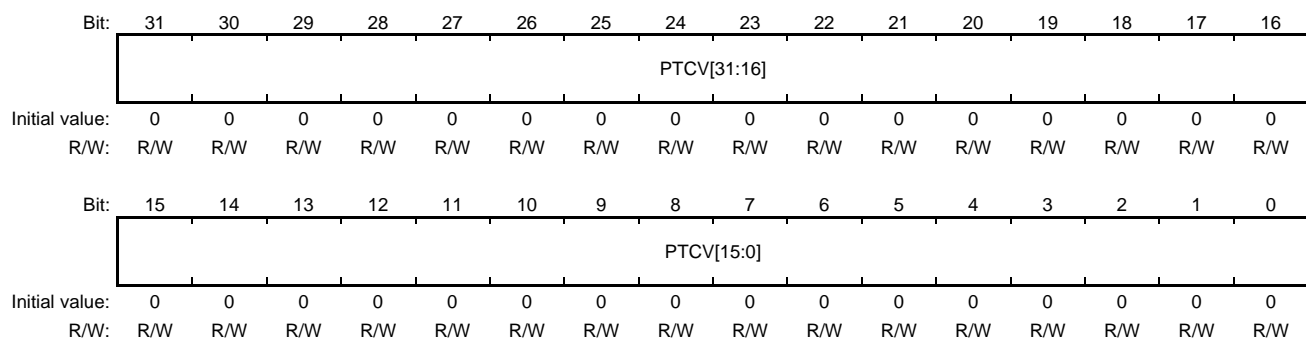

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | MTTV[31:0] | H'0000_0000 | R/W | <p>Maximum Transit Time</p> <p>These bits set the maximum transition time for use in calculating AVTP presentation time.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the maximum transit time configuration request bit in the gPTP configuration control register (GCCR.LMTT) to 1.</p> |

Note: Do not write a value to these bits when the operating mode is operation mode or CCC.GAC is 1 and the maximum transit time configuration request bit (GCCR.LMTT) is 1.

46.2.53 gPTP Presentation Time Comparison Register (GPTC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GPTC register sets a value for comparison with presentation times in the gPTP timer.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | PTCV[31:0] | H'0000_0000 | R/W | <p>Presentation Time Comparison Value</p> <p>These bits set a value for comparison with AVTP timer values to which a maximum transit time is not appended.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the presentation time comparison value configuration request bit in the gPTP configuration control register (GCCR.LPTC) to 1.</p> |

Note: Do not write a value to these bits when the presentation time comparison value configuration request bit (GCCR.LPTC) is 1.

The CPU should only write values in range of 0 to H'3FFF_FFFF to these bits when they are defining the period value of AVTP comparison unit (controlled by GCCR.SPC).

46.2.54 gPTP Timer Increment Configuration Register (GTI)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GTI register sets the increment for the gPTP timer.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 31 to 28 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 27 to 0 | TIV[27:0] | H'000_0001 | R/W | gPTP Timer Increment Value When the gPTP clock select bits in the AVB-DMAC mode register (CCC.CSEL) are selecting a clock signal, these bits set the value by which the timer is incremented each time a cycle of that clock signal elapses. Write the desired setting to the bits, then issue the configuration request by setting the timer increment value configuration request bit in the gPTP configuration control register (GCCR.LTI) to 1. |

Note: Do not write a value to these bits when the operating mode is operation mode and CCC.GAC is 1 and the timer increment value configuration request bit (GCCR.LTI) is 1.

Do not write 0 to the bits.

Keep comparison value in the following range

$$x \leq \text{comparison_value} \leq 2^{32} - x$$

, where x is amount of nanoseconds of the configured increment value in GTI.TIV

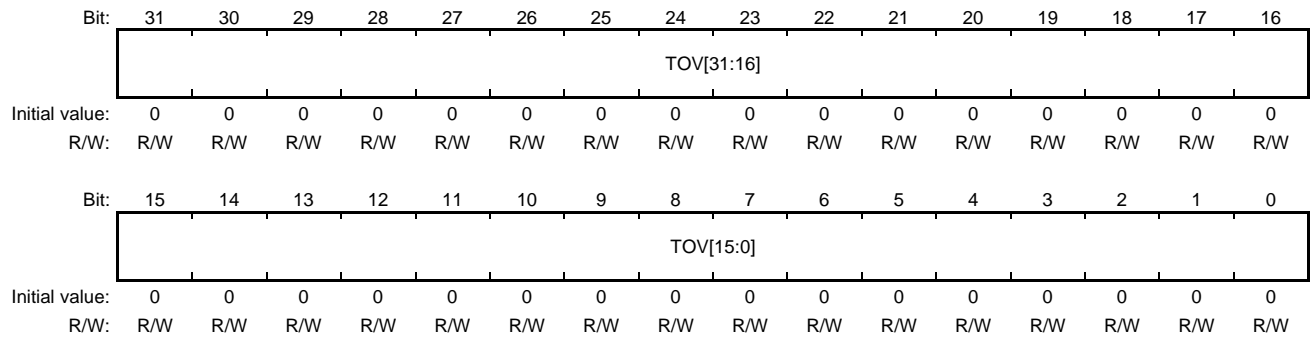

The CPU should not program increment values less than H'0010_0000

46.2.55 gPTP timer offset register i (GTOi) (i = 0 to 2)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GTOi register sets an offset value for the gPTP timer.

The offset value is added to the combination of bits 0 to 31 in GTO0, 32 to 63 in GTO1, and 64 to 79 in GTO2, which together make up the gPTP timer.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 0 | TOV[31:0] | H'0000_0000 | R/W | <p>Timer Offset Value</p> <p>This is an 80-bit value consisting of the settings in GTO0.TOV[31:0], GTO1.TOV[63:32], and GTO2.TOV[79:64], and is used to set an offset for adding to the value of the gPTP timer.</p> <p>Write the desired setting to the bits, then issue the configuration request by setting the timer offset value configuration request bit in the gPTP configuration control register (GCCR.LTO) to 1.</p> |

Note: Do not write a value to these bits when the operating mode is operation mode and CCC.GAC is 1 and the timer offset value configuration request bit (GCCR.LTO) is 1. Write H'0000 to GTO2.TOV[95:80]. Set a value in the range from 0 to 10⁹-1 (H'0000_0000 to H'3B9A_C9FF) in GTOi.TOV[31:0].

46.2.56 gPTP Interrupt Control Register (GIC)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GIC register is used to control gPTP-related interrupts.

46.2.58 gPTP Captured Presentation Time register (GCPT)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GCPT registers that captured presentation the gPTP timer value.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|---|
| 31 to 0 | CPTV[31:0] | H'0000_0000 | R | <p>Captured Presentation Time Value</p> <p>These bits represents the captured AVTP presentation time (with Max Transit Time added) due to HW trigger.</p> <p>The CPU should not read these bits when GIS.PTCF is 0.</p> <p>[Changing condition]</p> <p>These bits are updated with the current AVTP presentation time when an external capture trigger (avb_pt_capture[0]) occurs and GIS.PTCF is 0.</p> <p><i>Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.</i></p> |

46.2.59 gPTP Timer Capture Register i (GCTi) (i = 0 to 2)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GCTi registers form an 80-bit register that captures the gPTP timer value.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|--|
| 31 to 0 | CTV[31:0] | H'0000_0000 | R/W | <p>gPTP Timer Capture Value</p> <p>These 80 bits consist of GCT0.CTV[31:0], GCT1.CTV[63:32 and GCT2.CTV[79:64], which together indicate captured timer values.</p> <p>When B'00 (value of the gPTP timer) or B'01 (adjusted gPTP timer value) is selected by the timer capture source select bits in the gPTP configuration control register, the corresponding 80-bit values are stored in these bits.</p> <p>When B'10 (AVTP presentation time) is selected by the timer capture source select bit, the corresponding 32-bit values are stored in these bits.</p> <p>In case of continuous update (GCCR.TCR is B'10) CPU should only use 32 bit read access to get consistent value.</p> <p>Actual writing of the timer value specified by the timer capture source select bits (GCCR.TCSS) proceeds when B'11 (timer capture request) is written to the timer control request bits in the gPTP configuration control register (GCCR.TCR).</p> <p>Do not read the value while the value of the timer control request bits (GCCR.TCR) is B'11, because this indicates that storage is still in progress.</p> <p><i>Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.</i></p> |

46.2.60 gPTP Status Register (GSR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GSR register indicates the state of the gPTP.

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 31 | ATCS15 | B'0 | R/W | Avtp Time Captured interrupt Set 15 This bit supports interrupt enable. It controls set of GIC.ATCE15. This bit is always read as 0. 0: No change of GIC.ATCE15 1: Set GIC.ATCE15 to 1 |
| 30 | ATCS14 | B'0 | R/W | Avtp Time Captured interrupt Set 14 This bit supports interrupt enable. It controls set of GIC.ATCE14. This bit is always read as 0. 0: No change of GIC.ATCE14 1: Set GIC.ATCE14 to 1 |
| 29 | ATCS13 | B'0 | R/W | Avtp Time Captured interrupt Set 13 This bit supports interrupt enable. It controls set of GIC.ATCE13. This bit is always read as 0. 0: No change of GIC.ATCE13 1: Set GIC.ATCE13 to 1 |
| 28 | ATCS12 | B'0 | R/W | Avtp Time Captured interrupt Set 12 This bit supports interrupt enable. It controls set of GIC.ATCE12. This bit is always read as 0. 0: No change of GIC.ATCE12 1: Set GIC.ATCE12 to 1 |
| 27 | ATCS11 | B'0 | R/W | Avtp Time Captured interrupt Set 11 This bit supports interrupt enable. It controls set of GIC.ATCE11. This bit is always read as . 0: No change of GIC.ATCE11 1: Set GIC.ATCE11 to 1 |
| 26 | ATCS10 | B'0 | R/W | Avtp Time Captured interrupt Set 10 This bit supports interrupt enable. It controls set of GIC.ATCE10. This bit is always read as 0. 0: No change of GIC.ATCE10 1: Set GIC.ATCE10 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 25 | ATCS9 | B'0 | R/W | Avtp Time Captured interrupt Set 9 This bit supports interrupt enable. It controls set of GIC.ATCE9. This bit is always read as 0. 0: No change of GIC.ATCE9 1: Set GIC.ATCE9 to 1 |
| 24 | ATCS8 | B'0 | R/W | Avtp Time Captured interrupt Set 8 This bit supports interrupt enable. It controls set of GIC.ATCE8. This bit is always read as 0. 0: No change of GIC.ATCE8 1: Set GIC.ATCE8 to 1 |
| 23 | ATCS7 | B'0 | R/W | Avtp Time Captured interrupt Set 7 This bit supports interrupt enable. It controls set of GIC.ATCE7. This bit is always read as 0. 0: No change of GIC.ATCE7 1: Set GIC.ATCE7 to 1 |
| 22 | ATCS6 | B'0 | R/W | Avtp Time Captured interrupt Set 6 This bit supports interrupt enable. It controls set of GIC.ATCE6. This bit is always read as 0. 0: No change of GIC.ATCE6 1: Set GIC.ATCE6 to 1 |
| 21 | ATCS5 | B'0 | R/W | Avtp Time Captured interrupt Set 5 This bit supports interrupt enable. It controls set of GIC.ATCE5. This bit is always read as 0. 0: No change of GIC.ATCE5 1: Set GIC.ATCE5 to 1 |
| 20 | ATCS4 | B'0 | R/W | Avtp Time Captured interrupt Set 4 This bit supports interrupt enable. It controls set of GIC.ATCE4. This bit is always read as 0. 0: No change of GIC.ATCE4 1: Set GIC.ATCE4 to 1 |
| 19 | ATCS3 | B'0 | R/W | Avtp Time Captured interrupt Set 3 This bit supports interrupt enable. It controls set of GIC.ATCE3. This bit is always read as 0. 0: No change of GIC.ATCE3 1: Set GIC.ATCE3 to 1 |
| 18 | ATCS2 | B'0 | R/W | Avtp Time Captured interrupt Set 2 This bit supports interrupt enable. It controls set of GIC.ATCE2. This bit is always read as 0. 0: No change of GIC.ATCE2 1: Set GIC.ATCE2 to 1 |
| 17 | ATCS1 | B'0 | R/W | Avtp Time Captured interrupt Set 1 This bit supports interrupt enable. It controls set of GIC.ATCE1. This bit is always read as 0. 0: No change of GIC.ATCE1 1: Set GIC.ATCE1 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 16 | ATCS0 | B'0 | R/W | Avtp Time Captured interrupt Set 0 This bit supports interrupt enable. It controls set of GIC.ATCE0. This bit is always read as 0. 0: No change of GIC.ATCE0 1: Set GIC.ATCE0 to 1 |
| 15 to 10 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 9 | PTMS7 | B'0 | R/W | Presentation Time Matched interrupt Set 7 This bit supports interrupt enable. It controls set of GIC.PTME7. This bit is always read as 0. 0: No change of GIC.PTME7 1: Set GIC.PTME7 to 1 |
| 8 | PTMS6 | B'0 | R/W | Presentation Time Matched interrupt Set 6 This bit supports interrupt enable. It controls set of GIC.PTME6. This bit is always read as 0. 0: No change of GIC.PTME6 1: Set GIC.PTME6 to 1 |
| 7 | PTMS5 | B'0 | R/W | Presentation Time Matched interrupt Set 5 This bit supports interrupt enable. It controls set of GIC.PTME5. This bit is always read as 0. 0: No change of GIC.PTME5 1: Set GIC.PTME5 to 1 |
| 6 | PTMS4 | B'0 | R/W | Presentation Time Matched interrupt Set 4 This bit supports interrupt enable. It controls set of GIC.PTME4. This bit is always read as 0. 0: No change of GIC.PTME4 1: Set GIC.PTME4 to 1 |
| 5 | PTMS3 | B'0 | R/W | Presentation Time Matched interrupt Set 3 This bit supports interrupt enable. It controls set of GIC.PTME3. This bit is always read as 0. 0: No change of GIC.PTME3 1: Set GIC.PTME3 to 1 |
| 4 | PTMS2 | B'0 | R/W | Presentation Time Matched interrupt Set 2 This bit supports interrupt enable. It controls set of GIC.PTME2. This bit is always read as 0. 0: No change of GIC.PTME2 1: Set GIC.PTME2 to 1 |
| 3 | PTMS1 | B'0 | R/W | Presentation Time Matched interrupt Set 1 This bit supports interrupt enable. It controls set of GIC.PTME1. This bit is always read as 0. 0: No change of GIC.PTME1 1: Set GIC.PTME1 to 1 |
| 2 | PTMS0 | B'0 | R/W | Presentation Time Matched interrupt Set 0 This bit supports interrupt enable. It controls set of GIC.PTME0. This bit is always read as 0. 0: No change of GIC.PTME0 1: Set GIC.PTME0 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|------------|-----------------|----------------------|------------|---|
| 1 | PTOS | B'0 | R/W | Presentation Time Overrun interrupt Set This bit supports interrupt enable. It controls set of GIC.PTOE. This bit is always read as 0. 0: No change of GIC.PTOE 1: Set GIC.PTOE to 1 |
| 0 | PTCS | B'0 | R/W | Presentation Time Captured interrupt Set This bit supports interrupt enable. It controls set of GIC.PTCE. This bit is always read as 0. 0: No change of GIC.PTCE 1: Set GIC.PTCE to 1 |

46.2.62 gPTP Interrupt Disable register (GID)

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 31 | ATCD15 | B'0 | R/W | Avtp Time Captured interrupt Disable 15 This bit supports interrupt enable. It controls set of GIC.ATCE15. This bit is always read as 0. 0: No change of GIC.ATCE15 1: Set GIC.ATCE15 to 0 |
| 30 | ATCD14 | B'0 | R/W | Avtp Time Captured interrupt Disable 14 This bit supports interrupt enable. It controls set of GIC.ATCE14. This bit is always read as 0. 0: No change of GIC.ATCE14 1: Set GIC.ATCE14 to 0 |
| 29 | ATCD13 | B'0 | R/W | Avtp Time Captured interrupt Disable 13 This bit supports interrupt enable. It controls set of GIC.ATCE13. This bit is always read as 0. 0: No change of GIC.ATCE13 1: Set GIC.ATCE13 to 0 |
| 28 | ATCD12 | B'0 | R/W | Avtp Time Captured interrupt Disable 12 This bit supports interrupt enable. It controls set of GIC.ATCE12. This bit is always read as 0. 0: No change of GIC.ATCE12 1: Set GIC.ATCE12 to 0 |
| 27 | ATCD11 | B'0 | R/W | Avtp Time Captured interrupt Disable 11 This bit supports interrupt enable. It controls set of GIC.ATCE11. This bit is always read as 0. 0: No change of GIC.ATCE11 1: Set GIC.ATCE11 to 0 |
| 26 | ATCD10 | B'0 | R/W | Avtp Time Captured interrupt Disable 10 This bit supports interrupt enable. It controls set of GIC.ATCE10. This bit is always read as 0. 0: No change of GIC.ATCE10 1: Set GIC.ATCE10 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 25 | ATCD9 | B'0 | R/W | Avtp Time Captured interrupt Disable 9 This bit supports interrupt enable. It controls set of GIC.ATCE9. This bit is always read as 0. 0: No change of GIC.ATCE9 1: Set GIC.ATCE9 to 0 |
| 24 | ATCD8 | B'0 | R/W | Avtp Time Captured interrupt Disable 8 This bit supports interrupt enable. It controls set of GIC.ATCE8. This bit is always read as 0. 0: No change of GIC.ATCE8 1: Set GIC.ATCE8 to 0 |
| 23 | ATCD7 | B'0 | R/W | Avtp Time Captured interrupt Disable 7 This bit supports interrupt enable. It controls set of GIC.ATCE7. This bit is always read as 0. 0: No change of GIC.ATCE7 1: Set GIC.ATCE7 to 0 |
| 22 | ATCD6 | B'0 | R/W | Avtp Time Captured interrupt Disable 6 This bit supports interrupt enable. It controls set of GIC.ATCE6. This bit is always read as 0. 0: No change of GIC.ATCE6 1: Set GIC.ATCE6 to 0 |
| 21 | ATCD5 | B'0 | R/W | Avtp Time Captured interrupt Disable 5 This bit supports interrupt enable. It controls set of GIC.ATCE5. This bit is always read as 0. 0: No change of GIC.ATCE5 1: Set GIC.ATCE5 to 0 |
| 20 | ATCD4 | B'0 | R/W | Avtp Time Captured interrupt Disable 4 This bit supports interrupt enable. It controls set of GIC.ATCE4. This bit is always read as 0. 0: No change of GIC.ATCE4 1: Set GIC.ATCE4 to 0 |
| 19 | ATCD3 | B'0 | R/W | Avtp Time Captured interrupt Disable 3 This bit supports interrupt enable. It controls set of GIC.ATCE3. This bit is always read as 0. 0: No change of GIC.ATCE3 1: Set GIC.ATCE3 to 0 |
| 18 | ATCD2 | B'0 | R/W | Avtp Time Captured interrupt Disable 2 This bit supports interrupt enable. It controls set of GIC.ATCE2. This bit is always read as 0. 0: No change of GIC.ATCE2 1: Set GIC.ATCE2 to 0 |
| 17 | ATCD1 | B'0 | R/W | Avtp Time Captured interrupt Disable 1 This bit supports interrupt enable. It controls set of GIC.ATCE1. This bit is always read as 0. 0: No change of GIC.ATCE1 1: Set GIC.ATCE1 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 16 | ATCD0 | B'0 | R/W | Avtp Time Captured interrupt Disable 0 This bit supports interrupt enable. It controls set of GIC.ATCE0. This bit is always read as 0. 0: No change of GIC.ATCE0 1: Set GIC.ATCE0 to 0 |
| 15 to 10 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 9 | PTMD7 | B'0 | R/W | Presentation Time Matched interrupt Disable 7 This bit supports interrupt enable. It controls set of GIC.PTME7. This bit is always read as 0. 0: No change of GIC.PTME7 1: Set GIC.PTME7 to 0 |
| 8 | PTMD6 | B'0 | R/W | Presentation Time Matched interrupt Disable 6 This bit supports interrupt enable. It controls set of GIC.PTME6. This bit is always read as 0. 0: No change of GIC.PTME6 1: Set GIC.PTME6 to 0 |
| 7 | PTMD5 | B'0 | R/W | Presentation Time Matched interrupt Disable 5 This bit supports interrupt enable. It controls set of GIC.PTME5. This bit is always read as 0. 0: No change of GIC.PTME5 1: Set GIC.PTME5 to 0 |
| 6 | PTMD4 | B'0 | R/W | Presentation Time Matched interrupt Disable 4 This bit supports interrupt enable. It controls set of GIC.PTME4. This bit is always read as 0. 0: No change of GIC.PTME4 1: Set GIC.PTME4 to 0 |
| 5 | PTMD3 | B'0 | R/W | Presentation Time Matched interrupt Disable 3 This bit supports interrupt enable. It controls set of GIC.PTME3. This bit is always read as 0. 0: No change of GIC.PTME3 1: Set GIC.PTME3 to 0 |
| 4 | PTMD2 | B'0 | R/W | Presentation Time Matched interrupt Disable 2 This bit supports interrupt enable. It controls set of GIC.PTME2. This bit is always read as 0. 0: No change of GIC.PTME2 1: Set GIC.PTME2 to 0 |
| 3 | PTMD1 | B'0 | R/W | Presentation Time Matched interrupt Disable 1 This bit supports interrupt enable. It controls set of GIC.PTME1. This bit is always read as 0. 0: No change of GIC.PTME1 1: Set GIC.PTME1 to 0 |
| 2 | PTMD0 | B'0 | R/W | Presentation Time Matched interrupt Disable 0 This bit supports interrupt enable. It controls set of GIC.PTME0. This bit is always read as 0. 0: No change of GIC.PTME0 1: Set GIC.PTME0 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 1 | PTOD | B'0 | R/W | Presentation Time Overrun interrupt Disable This bit supports interrupt enable. It controls set of GIC.PTOE. This bit is always read as 0. 0: No change of GIC.PTOE 1: Set GIC.PTOE to 0 |
| 0 | PTCD | B'0 | R/W | Presentation Time Captured interrupt Disable This bit supports interrupt enable. It controls set of GIC.PTCE. This bit is always read as 0. 0: No change of GIC.PTCE 1: Set GIC.PTCE to 0 |

46.2.63 gPTP Interrupt Line selection register (GIL)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GIL register is used to control the gPTP Interrupt line.

| 5 | PTML3 | B'0 | R/W | Presentation Time Matched interrupt Line select 3 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 4 | PTML2 | B'0 | R/W | Presentation Time Matched interrupt Line select 2 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 3 | PTML1 | B'0 | R/W | Presentation Time Matched interrupt Line select 1 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 2 | PTML0 | B'0 | R/W | Presentation Time Matched interrupt Line select 0 This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 1 | PTOL | B'0 | R/W | Presentation Time Overrun interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |
| 0 | PTCL | B'0 | R/W | Presentation Time Captured interrupt Line select This bit selects the interrupt line used for this notification. It is recommended to disable interrupt before change the line. 0: Interrupt line A used for this notification 1: Interrupt line B used for this notification |

46.2.64 gPTP Avtp Capture Prescaler register (GACP)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GACP register is used to control the gPTP Capture Prescaler.

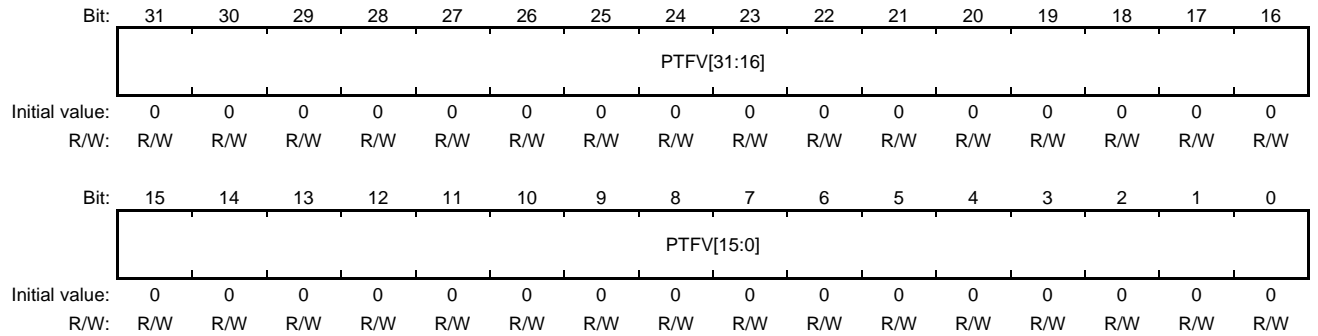

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----------|-----|-----|-----|-----------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | ACPN[3:0] | | | | ACPV[7:0] | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 12 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 11 to 8 | ACPN[3:0] | H'0 | R/W | Prescaler unit number to be configured Avtp Capture Prescaler unit Number These bits define the number <i>i</i> of AVTP capture unit where the prescaler value should be updated. These bits are always read as 0. The CPU can only write to these bits when CSR.OPS is OPERATION. The CPU can only write to these bits when CSR.OPS is CONFIG and CCC.GAC is 1. |
| 7 to 0 | ACPV[7:0] | H'00 | R/W | Prescaler configuration of AVTP capture unit <i>i</i> Avtp Capture Prescaler Value These bits define the prescaler configuration used by AVTP capture unit <i>i</i> . If the value is 0, on each rising edge of avb_pt_capture[<i>i</i> +1] the current AVTP timer value is captured. These bits are always read as 0. The CPU can only write to these bits when CSR.OPS is OPERATION. The CPU can only write to these bits when CSR.OPS is CONFIG and CCC.GAC is 1. |

46.2.65 gPTP Presentation Time FIFO register i (GPTFi) (i = 0 to 3)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GPTFi register is used to control the gPTP FIFO.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | PTFV[31:0] | H'0000_0000 | R/W | <p>Presentation Time Fifo Value</p> <p>These bits define a value to be compared with the AVTP timer value (without Max Transit Time added). When writing to this register the value is added to AVTP-FIFO of comparator unit i.</p> <p>These bits are always read as 0.</p> <p>The CPU cannot write to these bits if CSR.OPS is CONFIG and CCC.GAC is 0.</p> <p>The CPU should not write to these bits when GSR.PCMi is 1.</p> <p>The CPU should not write to these bits when GSR.AFUi is 1.</p> <p>The CPU should not write to these bits when GSR.AFFLi is 15.</p> |

46.2.66 gPTP Captured Avtp Time register i (GCATi) (i = 0 to 15)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GCATi register indicates the value of the gPTP captured time.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | CATV[31:0] | H'0000_0000 | R | <p>Captured AVTP time value</p> <p>These bits represents the captured AVTP time (without Max Transit Time added) due to HW trigger.</p> <p>The CPU should not read these bits when GIS.ATCFi is 0.</p> <p>[Changing condition]</p> <p>These bits are updated with the current AVTP time when an external capture trigger (avb_pt_capture[i+1]) occurs and GIS.ATCFi is 0.</p> <p><i>Note for verification: These bits are set to 0 when leaving OPERATION mode and CCC.GAC is 0.</i></p> |

46.2.67 Descriptor Interrupt Line selection register (DIL)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The DIL register is used to control the Descriptor Interrupt line.

| | | | | | | | | | | | | | | | | |
|----------------|-------|-------|-------|-------|-------|-------|------|------|------|------|------|------|------|------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 | DPS15 | B'0 | R/W | Descriptor Processed interrupt Set 15 This bit supports interrupt enable. It controls set of DIC.DPE15. This bit is always read as 0. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 1 |
| 14 | DPS14 | B'0 | R/W | Descriptor Processed interrupt Set 14 This bit supports interrupt enable. It controls set of DIC.DPE14. This bit is always read as 0. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 1 |
| 13 | DPS13 | B'0 | R/W | Descriptor Processed interrupt Set 13 This bit supports interrupt enable. It controls set of DIC.DPE13. This bit is always read as 0. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 1 |
| 12 | DPS12 | B'0 | R/W | Descriptor Processed interrupt Set 12 This bit supports interrupt enable. It controls set of DIC.DPE12. This bit is always read as 0. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 1 |
| 11 | DPS11 | B'0 | R/W | Descriptor Processed interrupt Set 11 This bit supports interrupt enable. It controls set of DIC.DPE11. This bit is always read as 0. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 10 | DPS10 | B'0 | R/W | Descriptor Processed interrupt Set 10 This bit supports interrupt enable. It controls set of DIC.DPE10. This bit is always read as 0. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 1 |
| 9 | DPS9 | B'0 | R/W | Descriptor Processed interrupt Set 9 This bit supports interrupt enable. It controls set of DIC.DPE9. This bit is always read as 0. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 1 |
| 8 | DPS8 | B'0 | R/W | Descriptor Processed interrupt Set 8 This bit supports interrupt enable. It controls set of DIC.DPE8. This bit is always read as 0. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 1 |
| 7 | DPS7 | B'0 | R/W | Descriptor Processed interrupt Set 7 This bit supports interrupt enable. It controls set of DIC.DPE7. This bit is always read as 0. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 1 |
| 6 | DPS6 | B'0 | R/W | Descriptor Processed interrupt Set 6 This bit supports interrupt enable. It controls set of DIC.DPE6. This bit is always read as 0. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 1 |
| 5 | DPS5 | B'0 | R/W | Descriptor Processed interrupt Set 5 This bit supports interrupt enable. It controls set of DIC.DPE5. This bit is always read as 0. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 1 |
| 4 | DPS4 | B'0 | R/W | Descriptor Processed interrupt Set 4 This bit supports interrupt enable. It controls set of DIC.DPE4. This bit is always read as 0. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 1 |
| 3 | DPS3 | B'0 | R/W | Descriptor Processed interrupt Set 3 This bit supports interrupt enable. It controls set of DIC.DPE3. This bit is always read as 0. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 1 |
| 2 | DPS2 | B'0 | R/W | Descriptor Processed interrupt Set 2 This bit supports interrupt enable. It controls set of DIC.DPE2. This bit is always read as 0. 0: No change of DIC.DPE2 1: Set DIC.DPEi to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 1 | DPS1 | B'0 | R/W | Descriptor Processed interrupt Set 1 This bit supports interrupt enable. It controls set of DIC.DPE1. This bit is always read as 0. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 1 |
| 0 | — | B'0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

46.2.71 Descriptor Interrupt Disable register (DID)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The DID register is used to control the Descriptor Interrupt.

| | | | | | | | | | | | | | | | | |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 | DPD15 | B'0 | R/W | Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of DIC.DPE15. This bit is always read as 0. 0: No change of DIC.DPE15 1: Set DIC.DPE15 to 0 |
| 14 | DPD14 | B'0 | R/W | Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of DIC.DPE14. This bit is always read as 0. 0: No change of DIC.DPE14 1: Set DIC.DPE14 to 0 |
| 13 | DPD13 | B'0 | R/W | Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of DIC.DPE13. This bit is always read as 0. 0: No change of DIC.DPE13 1: Set DIC.DPE13 to 0 |
| 12 | DPD12 | B'0 | R/W | Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of DIC.DPE12. This bit is always read as 0. 0: No change of DIC.DPE12 1: Set DIC.DPE12 to 0 |
| 11 | DPD11 | B'0 | R/W | Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of DIC.DPE11. This bit is always read as 0. 0: No change of DIC.DPE11 1: Set DIC.DPE11 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 10 | DPD10 | B'0 | R/W | Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of DIC.DPE10. This bit is always read as 0. 0: No change of DIC.DPE10 1: Set DIC.DPE10 to 0 |
| 9 | DPD9 | B'0 | R/W | Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of DIC.DPE9. This bit is always read as 0. 0: No change of DIC.DPE9 1: Set DIC.DPE9 to 0 |
| 8 | DPD8 | B'0 | R/W | Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of DIC.DPE8. This bit is always read as 0. 0: No change of DIC.DPE8 1: Set DIC.DPE8 to 0 |
| 7 | DPD7 | B'0 | R/W | Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of DIC.DPE7. This bit is always read as 0. 0: No change of DIC.DPE7 1: Set DIC.DPE7 to 0 |
| 6 | DPD6 | B'0 | R/W | Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of DIC.DPE6. This bit is always read as 0. 0: No change of DIC.DPE6 1: Set DIC.DPE6 to 0 |
| 5 | DPD5 | B'0 | R/W | Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of DIC.DPE5. This bit is always read as 0. 0: No change of DIC.DPE5 1: Set DIC.DPE5 to 0 |
| 4 | DPD4 | B'0 | R/W | Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of DIC.DPE4. This bit is always read as 0. 0: No change of DIC.DPE4 1: Set DIC.DPE4 to 0 |
| 3 | DPD3 | B'0 | R/W | Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of DIC.DPE3. This bit is always read as 0. 0: No change of DIC.DPE3 1: Set DIC.DPE3 to 0 |
| 2 | DPD2 | B'0 | R/W | Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of DIC.DPE2. This bit is always read as 0. 0: No change of DIC.DPE2 1: Set DIC.DPE2 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 1 | DPD1 | B'0 | R/W | Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of DIC.DPE1. This bit is always read as 0. 0: No change of DIC.DPE1 1: Set DIC.DPE1 to 0 |
| 0 | — | B'0 | R/W | Reserved These bits are read as 0. The write value should be 0. |

46.2.72 Error Interrupt Enable register (EIE)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The EIE register is used to control the Error Interrupt.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|------|------|------|-------|-------|-------|-------|-----|-----|------|------|

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | RFFS | B'0 | R/W | Rx-FIFO Full interrupt Set This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0. 0: No change of RIC2.RFFE 1: Set RIC2.RFFE to 1 |
| 30 to 18 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 17 | QFS17 | B'0 | R/W | Queue Full interrupt Set 17 This bit supports interrupt enable. It controls set of RIC2.QFE17. This bit is always read as 0. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 1 |
| 16 | QFS16 | B'0 | R/W | Queue Full interrupt Set 16 This bit supports interrupt enable. It controls set of RIC2.QFE16. This bit is always read as 0. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 1 |
| 15 | QFS15 | B'0 | R/W | Queue Full interrupt Set 15 This bit supports interrupt enable. It controls set of RIC2.QFE15. This bit is always read as 0. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 1 |
| 14 | QFS14 | B'0 | R/W | Queue Full interrupt Set 14 This bit supports interrupt enable. It controls set of RIC2.QFE14. This bit is always read as 0. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 13 | QFS13 | B'0 | R/W | Queue Full interrupt Set 13 This bit supports interrupt enable. It controls set of RIC2.QFE13. This bit is always read as 0. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 1 |
| 12 | QFS12 | B'0 | R/W | Queue Full interrupt Set 12 This bit supports interrupt enable. It controls set of RIC2.QFE12. This bit is always read as 0. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 1 |
| 11 | QFS11 | B'0 | R/W | Queue Full interrupt Set 11 This bit supports interrupt enable. It controls set of RIC2.QFE11. This bit is always read as 0. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 1 |
| 10 | QFS10 | B'0 | R/W | Queue Full interrupt Set 10 This bit supports interrupt enable. It controls set of RIC2.QFE10. This bit is always read as 0. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 1 |
| 9 | QFS9 | B'0 | R/W | Queue Full interrupt Set 9 This bit supports interrupt enable. It controls set of RIC2.QFE9. This bit is always read as 0. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 1 |
| 8 | QFS8 | B'0 | R/W | Queue Full interrupt Set 8 This bit supports interrupt enable. It controls set of RIC2.QFE8. This bit is always read as 0. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 1 |
| 7 | QFS7 | B'0 | R/W | Queue Full interrupt Set 7 This bit supports interrupt enable. It controls set of RIC2.QFE7. This bit is always read as 0. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 1 |
| 6 | QFS6 | B'0 | R/W | Queue Full interrupt Set 6 This bit supports interrupt enable. It controls set of RIC2.QFE6. This bit is always read as 0. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 1 |
| 5 | QFS5 | B'0 | R/W | Queue Full interrupt Set 5 This bit supports interrupt enable. It controls set of RIC2.QFE5. This bit is always read as 0. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 1 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 4 | QFS4 | B'0 | R/W | Queue Full interrupt Set 4 This bit supports interrupt enable. It controls set of RIC2.QFE4. This bit is always read as 0. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 1 |
| 3 | QFS3 | B'0 | R/W | Queue Full interrupt Set 3 This bit supports interrupt enable. It controls set of RIC2.QFE3. This bit is always read as 0. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 1 |
| 2 | QFS2 | B'0 | R/W | Queue Full interrupt Set 2 This bit supports interrupt enable. It controls set of RIC2.QFE2. This bit is always read as 0. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 1 |
| 1 | QFS1 | B'0 | R/W | Queue Full interrupt Set 1 This bit supports interrupt enable. It controls set of RIC2.QFE1. This bit is always read as 0. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 1 |
| 0 | QFS0 | B'0 | R/W | Queue Full interrupt Set 0 This bit supports interrupt enable. It controls set of RIC2.QFE0. This bit is always read as 0. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 1 |

46.2.79 Reception Interrupt Disable register 2 (RID2)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RID2 register is used to control the Reception Interrupt.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 | RFFD | B'0 | R/W | Rx-FIFO Full interrupt Disable This bit supports interrupt enable. It controls set of RIC2.RFFE. This bit is always read as 0. 0: No change of RIC2.RFFE 1: Set RIC2.RFFE to 0 |
| 30 to 18 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 17 | QFD17 | B'0 | R/W | Queue Full interrupt Disable 17 This bit supports interrupt enable. It controls set of RIC2.QFE17. This bit is always read as 0. 0: No change of RIC2.QFE17 1: Set RIC2.QFE17 to 0 |
| 16 | QFD16 | B'0 | R/W | Queue Full interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC2.QFE16. This bit is always read as 0. 0: No change of RIC2.QFE16 1: Set RIC2.QFE16 to 0 |
| 15 | QFD15 | B'0 | R/W | Queue Full interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC2.QFE15. This bit is always read as 0. 0: No change of RIC2.QFE15 1: Set RIC2.QFE15 to 0 |
| 14 | QFD14 | B'0 | R/W | Queue Full interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC2.QFE14. This bit is always read as 0. 0: No change of RIC2.QFE14 1: Set RIC2.QFE14 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 13 | QFD13 | B'0 | R/W | Queue Full interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC2.QFE13. This bit is always read as 0. 0: No change of RIC2.QFE13 1: Set RIC2.QFE13 to 0 |
| 12 | QFD12 | B'0 | R/W | Queue Full interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC2.QFE12. This bit is always read as 0. 0: No change of RIC2.QFE12 1: Set RIC2.QFE12 to 0 |
| 11 | QFD11 | B'0 | R/W | Queue Full interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC2.QFE11. This bit is always read as 0. 0: No change of RIC2.QFE11 1: Set RIC2.QFE11 to 0 |
| 10 | QFD10 | B'0 | R/W | Queue Full interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC2.QFE10. This bit is always read as 0. 0: No change of RIC2.QFE10 1: Set RIC2.QFE10 to 0 |
| 9 | QFD9 | B'0 | R/W | Queue Full interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC2.QFE9. This bit is always read as 0. 0: No change of RIC2.QFE9 1: Set RIC2.QFE9 to 0 |
| 8 | QFD8 | B'0 | R/W | Queue Full interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC2.QFE8. This bit is always read as 0. 0: No change of RIC2.QFE8 1: Set RIC2.QFE8 to 0 |
| 7 | QFD7 | B'0 | R/W | Queue Full interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC2.QFE7. This bit is always read as 0. 0: No change of RIC2.QFE7 1: Set RIC2.QFE7 to 0 |
| 6 | QFD6 | B'0 | R/W | Queue Full interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC2.QFE6. This bit is always read as 0. 0: No change of RIC2.QFE6 1: Set RIC2.QFE6 to 0 |
| 5 | QFD5 | B'0 | R/W | Queue Full interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC2.QFE5. This bit is always read as 0. 0: No change of RIC2.QFE5 1: Set RIC2.QFE5 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 4 | QFD4 | B'0 | R/W | Queue Full interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC2.QFE4. This bit is always read as 0. 0: No change of RIC2.QFE4 1: Set RIC2.QFE4 to 0 |
| 3 | QFD3 | B'0 | R/W | Queue Full interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC2.QFE3. This bit is always read as 0. 0: No change of RIC2.QFE3 1: Set RIC2.QFE3 to 0 |
| 2 | QFD2 | B'0 | R/W | Queue Full interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC2.QFE2. This bit is always read as 0. 0: No change of RIC2.QFE2 1: Set RIC2.QFE2 to 0 |
| 1 | QFD1 | B'0 | R/W | Queue Full interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC2.QFE1. This bit is always read as 0. 0: No change of RIC2.QFE1 1: Set RIC2.QFE1 to 0 |
| 0 | QFD0 | B'0 | R/W | Queue Full interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC2.QFE0. This bit is always read as 0. 0: No change of RIC2.QFE0 1: Set RIC2.QFE0 to 0 |

46.2.80 Transmission Interrupt Enable register (TIE)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TIE register is used to control the Transmission Interrupt.

| | | | | | | | | | | | | | | | | |

| 16 | RDPD16 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 16 This bit supports interrupt enable. It controls set of RIC3.RDPE16. This bit is always read as 0. 0: No change of RIC3.RDPE16 1: Set RIC3.RDPE16 to 0 |
| 15 | RDPD15 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 15 This bit supports interrupt enable. It controls set of RIC3.RDPE15. This bit is always read as 0. 0: No change of RIC3.RDPE15 1: Set RIC3.RDPE15 to 0 |
| 14 | RDPD14 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 14 This bit supports interrupt enable. It controls set of RIC3.RDPE14. This bit is always read as 0. 0: No change of RIC3.RDPE14 1: Set RIC3.RDPE14 to 0 |
| 13 | RDPD13 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 13 This bit supports interrupt enable. It controls set of RIC3.RDPE13. This bit is always read as 0. 0: No change of RIC3.RDPE13 1: Set RIC3.RDPE13 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 12 | RDPD12 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 12 This bit supports interrupt enable. It controls set of RIC3.RDPE12. This bit is always read as 0. 0: No change of RIC3.RDPE12 1: Set RIC3.RDPE12 to 0 |
| 11 | RDPD11 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 11 This bit supports interrupt enable. It controls set of RIC3.RDPE11. This bit is always read as 0. 0: No change of RIC3.RDPE11 1: Set RIC3.RDPE11 to 0 |
| 10 | RDPD10 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 10 This bit supports interrupt enable. It controls set of RIC3.RDPE10. This bit is always read as 0. 0: No change of RIC3.RDPE10 1: Set RIC3.RDPE10 to 0 |
| 9 | RDPD9 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 9 This bit supports interrupt enable. It controls set of RIC3.RDPE9. This bit is always read as 0. 0: No change of RIC3.RDPE9 1: Set RIC3.RDPE9 to 0 |
| 8 | RDPD8 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 8 This bit supports interrupt enable. It controls set of RIC3.RDPE8. This bit is always read as 0. 0: No change of RIC3.RDPE8 1: Set RIC3.RDPE8 to 0 |
| 7 | RDPD7 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 7 This bit supports interrupt enable. It controls set of RIC3.RDPE7. This bit is always read as 0. 0: No change of RIC3.RDPE7 1: Set RIC3.RDPE7 to 0 |
| 6 | RDPD6 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 6 This bit supports interrupt enable. It controls set of RIC3.RDPE6. This bit is always read as 0. 0: No change of RIC3.RDPE6 1: Set RIC3.RDPE6 to 0 |
| 5 | RDPD5 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 5 This bit supports interrupt enable. It controls set of RIC3.RDPE5. This bit is always read as 0. 0: No change of RIC3.RDPE5 1: Set RIC3.RDPE5 to 0 |
| 4 | RDPD4 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 4 This bit supports interrupt enable. It controls set of RIC3.RDPE4. This bit is always read as 0. 0: No change of RIC3.RDPE4 1: Set RIC3.RDPE4 to 0 |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 3 | RDPD3 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 3 This bit supports interrupt enable. It controls set of RIC3.RDPE3. This bit is always read as 0. 0: No change of RIC3.RDPE3 1: Set RIC3.RDPE3 to 0 |
| 2 | RDPD2 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 2 This bit supports interrupt enable. It controls set of RIC3.RDPE2. This bit is always read as 0. 0: No change of RIC3.RDPE2 1: Set RIC3.RDPE2 to 0 |
| 1 | RDPD1 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 1 This bit supports interrupt enable. It controls set of RIC3.RDPE1. This bit is always read as 0. 0: No change of RIC3.RDPE1 1: Set RIC3.RDPE1 to 0 |
| 0 | RDPD0 | B'0 | R/W | Receive Descriptor Processed interrupt Disable 0 This bit supports interrupt enable. It controls set of RIC3.RDPE0. This bit is always read as 0. 0: No change of RIC3.RDPE0 1: Set RIC3.RDPE0 to 0 |

46.2.84 E-MAC Mode Register (ECMR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

ECMR is used to specify the operating mode of the E-MAC. The settings in this register are normally made in the initialization process following a reset.

The operating mode settings must not be changed while transmission or reception is enabled (i.e. while the RE or TE bit in this register is 1).

| | | | | | | | | | | | | | | | | |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | MPDE | — | — | RE | TE | — | — | — | DM | PRM |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 27 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 26 | TRCCM | B'0 | R/W | Counter Clear Mode This bit sets the method for clearing the counter register. Refer to the descriptions of the counter registers. 0: Writing to a counter register leads to the register being cleared to 0. 1: Reading from a counter register leads to the register being cleared to 0. |
| 25, 24 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 23 | RCSC | B'0 | R/W | Checksum Calculation Setting this bit to 1 enables automatic calculation of checksums for data in received frames. Only the data field of an Ethernet frame without a VLAN field is in the scope of checksum calculation. Specifically, the checksum is calculated from the data field, which follows the length/type field and is followed by the CRC field. Calculation only involves 16-bit addition; it does not involve bit inversion. 0: Checksums are not automatically calculated. 1: Checksums are automatically calculated. |
| 22 | — | B'0 | R/W | Reserved This bit is read as 0. The write value should be 0. |

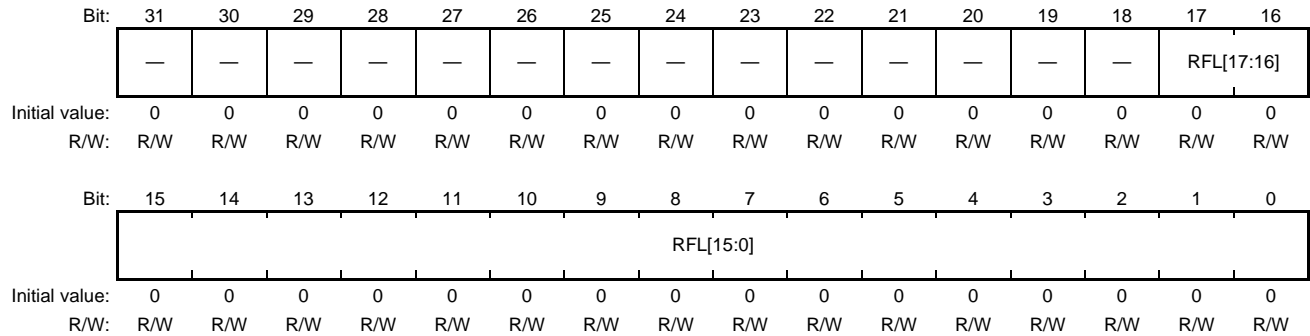

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 21 | DPAD | B'0 | R/W | <p>Data Padding</p> <p>This bit specifies padding or non-padding of data when less than 60 bytes are to be transmitted.</p> <p>When this bit is set to 1, data are transmitted without padding; when it is set to 0, data are padded to make up 60-byte units for transmission.</p> <p>0: Padding to make up 60 bytes is inserted in data for transmission when fewer than 60 bytes are to be transmitted.</p> <p>1: Padding is not inserted in data for transmission when fewer than 60 bytes are to be transmitted and the data are transmitted without being changed.</p> |
| 20 | RZPF | B'0 | R/W | <p>PAUSE Frame Reception with Time = 0</p> <p>When the RZPF bit is set to 0, received PAUSE frames with the Timer value 0 are discarded.</p> <p>When the RZPF bit is set to 1, release from the transmission wait state follows reception of a PAUSE frame with the Timer value 0.</p> <p>0: Reception of PAUSE frames with the TIME parameter value 0 is disabled.</p> <p>1: Reception of PAUSE frames with the TIME parameter value 0 is enabled.</p> |
| 19 | TZPF | B'0 | R/W | <p>Transmit Zero PAUSE Frame</p> <p>When setting CCC.FCE=1, and Rx FIFO become Warning Level.</p> <p>0: Not transmit the PAUSE frame of TIME parameter value 0.</p> <p>1: Transmit the PAUSE frame of TIME parameter value 0.</p> |
| 18 | PFR | B'0 | R/W | <p>PAUSE Frame Receive Mode</p> <p>This bit specifies whether PAUSE frames are transferred to the AVB-DMAC.</p> <p>0: PAUSE frames are not transferred to the AVB-DMAC.</p> <p>1: PAUSE frames are transferred to the AVB-DMAC.</p> |
| 17 | RXF | B'0 | R/W | <p>Operating Mode for Flow Control in Reception</p> <p>When the RXF bit is set to 1 and a PAUSE frame is received, a next frame to be transmitted is not transmitted until the time indicated by the Timer value in the PAUSE frame has elapsed. However, the transmission of a current frame is continued. The number of received PAUSE frames is also counted. For details, see section 46.2.95 PAUSE Frame Receive Counter (PFRCCR).</p> <p>Setting this bit to 0 disables PAUSE frame detection.</p> <p>0: Detection of PAUSE frames is disabled.</p> <p>1: Flow control for the receiving port is enabled.</p> |
| 16 | TXF | B'0 | R/W | <p>Transmit Flow control mode</p> <p>0: Flow control for the transmitting port is disabled.</p> <p>1: Flow control for the transmitting port is enabled.</p> |
| 15 to 10 | — | All 0 | R/W | <p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p> |
| 9 | MPDE | B'0 | R/W | <p>Magic Packet™ Detection Enable</p> <p>The MPDE bit enables or disables Magic Packet™ detection by hardware to allow activation via the Ethernet connection.</p> <p>0: Magic Packet™ detection is not enabled.</p> <p>1: Magic Packet™ detection is enabled.</p> |
| 8, 7 | — | All 0 | R/W | <p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 6 | RE | B'0 | R/W | <p>Reception Enable</p> <p>If this bit is switched from reception being enabled (RE = 1) to reception being disabled (RE = 0) while a frame is being received, reception will continue until reception of the frame is completed.</p> <p>0: Reception is disabled. 1: Reception is enabled.</p> |
| 5 | TE | B'0 | R/W | <p>Transmission Enable</p> <p>If this bit is switched from transmission being enabled (TE = 1) to transmission being disabled (TE = 0) while a frame is being transmitted, transmission will continue until transmission of that frame is completed.</p> <p>0: Transmission is disabled. 1: Transmission is enabled.</p> |
| 4 to 2 | — | All 0 | R/W | <p>Reserved</p> <p>These bits are read as 0. The write value should be 0.</p> |
| 1 | DM | B'0 | R/W | <p>Duplex Mode</p> <p>This bit should always be set to 1. The value after reset is 0.</p> <p>0: Value after reset 1: Full-duplex operation</p> <p>This bit should always be set to 1.</p> |
| 0 | PRM | B'0 | R/W | <p>Promiscuous Mode</p> <p>Setting the PRM bit enables all Ethernet frames to be received. All Ethernet frames mean all receivable frames, irrespective of differences of destination address (exclude PAUSE frame).</p> <p>0: Normal operation 1: Promiscuous mode operation</p> |

46.2.85 Receive Frame Length Register (RFLR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RFLR register specifies the maximum length (in bytes) of frames that can be received by this LSI. Settings in this register must not be changed while reception is enabled (while the RE bit in the E-MAC mode register (EMCR) is 1).

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 31 to 18 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 17 to 0 | RFL[17:0] | H'0_0000 | R/W | Receive Frame Length Frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data are not included in the transfer. When more data than the specified number of bytes are received, the portion of data that exceeds the specified value and more 8 byte length is discarded. CAUTION: The prepared descriptor data size is just the specified value (RFLR.RFL). Therefore descriptor data size must be more than RFLR.RFL + 8 if you will receive such the long frame. H'0_0000 to H'0_05EE: 1,518 bytes H'0_05EF: 1,519 bytes H'0_05F0: 1,520 bytes : : H'0_07FF: 2,047 bytes H'0_0800: 2,048 bytes : : H'0_1000: 4,096 bytes : : H'1_0000: 65,535 bytes : : H'2_0000 to H'3_FFFF: 131,072 bytes |

46.2.86 E-MAC Status Register (ECSR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The ECSR register indicates the state of the E-MAC. The CPU can be notified of the state. For bits associated with interrupts, the interrupt can be enabled or disabled by the corresponding bit in the E-MAC Interrupt Permission Register (ECSIPR) described in section 46.2.88.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|------|-------|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| | — | — | — | — | — | — | — | — | — | — | — | PFRI | PHYI | LCHNG | MPD | ICD |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 5 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 4 | PFRI | B'0 | R/W | PAUSE Frame Retry Interrupt This bit indicate that reached to the number of PAUSE frame retransmission for register PFTTLR setting. Procedure for 0-clear to this bit is follows. 0: Read the PFTTCR register to clear the PFTTCR register. 1: Write to this bit 1. |
| 3 | PHYI | B'0 | R/W | PHY interrupt terminal state bit This bit indicates the state of input to the PHY interrupt pin (AVB_PHY_INT) from the PHY-LSI. 0: PHY interrupt terminal (AVB_PHY_INT) is not asserted. 1: PHY interrupt terminal (AVB_PHY_INT) is asserted. |
| 2 | LCHNG | B'0 | R/W | Link signal change bit This bit indicates a transition of the link status signal (AVB_LINK) input from the PHY-LSI from high to low or low to high. However, signal changes may also be detected at times when the link status signal (AVB_LINK) function is selected. To check the current link state, refer to the link status pin state bit in the PHY status register (PSR.LMON). 0: The change of Link status signal (AVB_LINK) is not detected. 1: The change of Link status signal (AVB_LINK) is detected. |
| 1 | MPD | B'0 | R/W | Magic Packet™ Detection This bit indicates that a Magic Packet™ has been detected on the line. Writing 1 to this bit clears it to 0. 0: A Magic Packet™ has not been detected. 1: A Magic Packet™ has been detected. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 0 | ICD | B'0 | R/W | <p>Illegal Carrier Detection</p> <p>This bit indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.</p> <p>Writing 1 to this bit clears it to 0.</p> <p>0: PHY-LSI has not detected an illegal carrier on the line.</p> <p>1: PHY-LSI has detected an illegal carrier on the line.</p> |

46.2.87 E-MAC Interrupt Permission Register (ECSIPR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The ECSIPR register enables or disables the states indicated by the ECSR register as interrupt sources. Each effective bit disables or enables interrupts corresponding to the bits in ECSR.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-------|-------|--------|-------|-------|

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 5 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 4 | PFRIM | B'0 | R/W | PAUSE Frame Retry Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PAUSE Frame Retry Interrupt bit (ECSR.PFRI) in the E-MAC status register to 1. 0: Interrupts on setting of the PFRI bit is disabled. 1: Interrupts on setting of the PFRI bit is enabled. |
| 3 | PHYIM | B'0 | R/W | PHY Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the PHY interrupt terminal state bit (ECSR.PHYI) in the E-MAC status register to 1. 0: Interrupts on setting of the PHYI bit is disabled. 1: Interrupts on setting of the PHYI bit is enabled. |
| 2 | LINKIM | B'0 | R/W | LINK Interrupt Mask Setting this bit to 1 selects interrupt generation on setting of the Link signal change bit (ECSR.LCHNG) in the E-MAC status register to 1. 0: Interrupts on setting of the LCHNG bit is disabled. 1: Interrupts on setting of the LCHNG bit is enabled. |
| 1 | MPDIP | B'0 | R/W | Magic Packet™ Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the Magic Packet™ detection bit (ECSR.MPD) in the E-MAC status register to 1. 0: Interrupts on setting of the MPD bit is disabled. 1: Interrupts on setting of the MPD bit is enabled. |
| 0 | ICDIP | B'0 | R/W | Illegal Carrier Detect Interrupt Enable Setting this bit to 1 selects interrupt generation on setting of the illegal carrier detection bit (ECSR.ICD) in the E-MAC status register to 1. 0: Interrupts on setting of the ICD bit is disabled. 1: Interrupt on setting of the ICD bit is enabled. |

46.2.88 PHY Interface Register (PIR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The PIR register provides a means of access to the PHY-LSI internal registers via the MII.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | MDI | MDO | MMD | MDC |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | — | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 4 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 3 | MDI | — | R/W | MII Management Data-In This bit indicates the level of the AVB_MDIO pin. |
| 2 | MDO | B'0 | R/W | MII Management Data-Out This bit holds data for output from the AVB_MDIO pin. The AVB_MDIO pin outputs data when the MMD bit is set to 1 (to specify writing as the direction). Data are not output while the MMD bit is set to 0 (to specify reading as the direction). |
| 1 | MMD | B'0 | R/W | MII Management Mode This bit specifies the direction for data through MDIO (reading or writing). 0: Read direction is specified. 1: Write direction is specified. |
| 0 | MDC | B'0 | R/W | MII Management Data Clock Values set in this bit are output on the AVB_MDC pin to supply the MII with the management data clock. For the method of access to the MII registers, see section 46.3.13 Connection to PHY-LSI. |

46.2.89 PHY Status Register (PSR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The PSR register is a read-only register that can read interface signals from the PHY-LSI.

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | LMON |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are read as 0. |
| 0 | LMON | B'0 | R | Link Status Pin State The Link state can be read by connecting the Link signal output from the PHY-LSI to the link status pin (AVB_LNK) pin. For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: The link status signal (AVB_LNK) is at the low level. 1: The link status signal (AVB_LNK) is at the high level. |

46.2.90 PHY_INT Polarity Register (PIPR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The PIPR register is used to set the active sense of the AVB_PHY-INT pin.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PHYIP |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

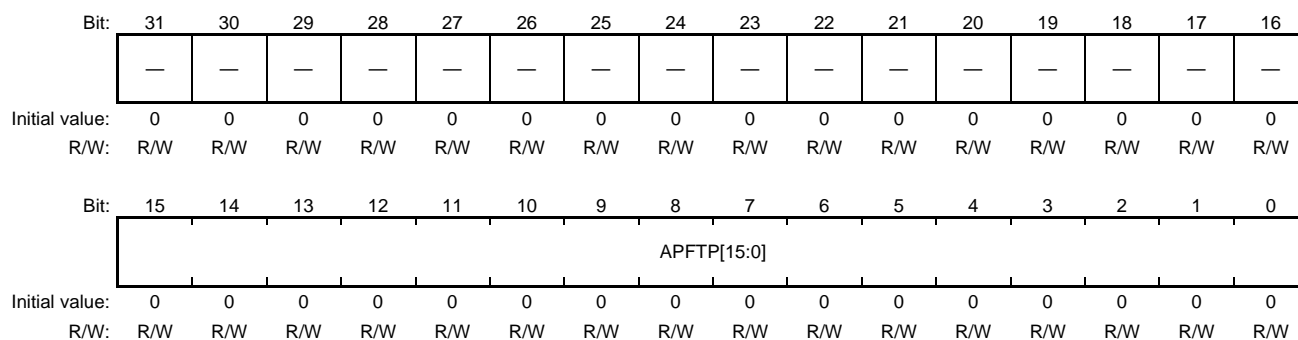

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 0 | PHYIP | B'0 | R/W | PHY Interrupt Input Pin Polarity This bit sets the active sense of the PHY interrupt pin (AVB_PHY-INT). For the active sense, refer to the specifications of the PHY-LSI to be connected. 0: PHY interrupt pin (AVB_PHY-INT) is active low (the low level triggers the interrupt state) 1: PHY interrupt pin (AVB_PHY-INT) is active high (the high level triggers the interrupt state) |

46.2.91 Automatic PAUSE frame register (APR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The APR register is used to set the value for the TIME parameter of auto generated PAUSE frames.

When ECMR.TXF = b'1, the value shouldn't set all 0 in this register.

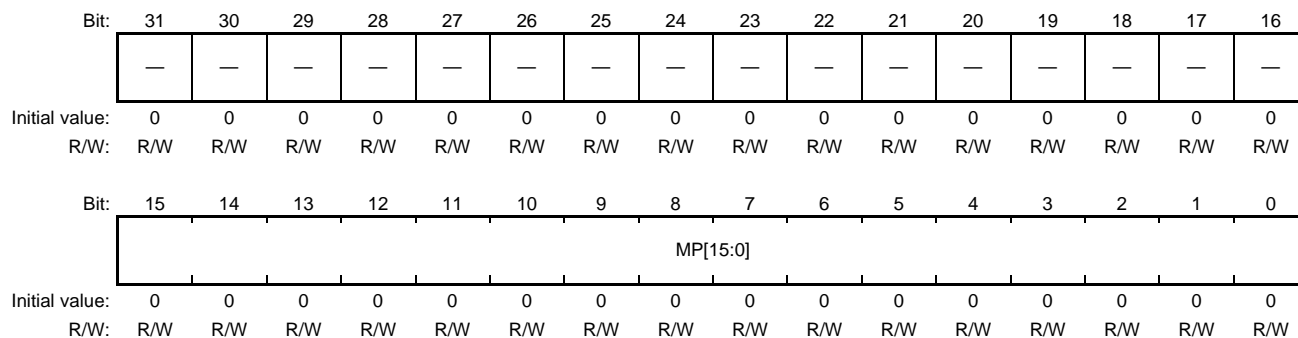

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | APFTP[15:0] | H'0000 | R/W | Auto Pause Frame Time Parameter When a PAUSE frame is auto transmitted, the value set in this register is used as its TIME parameter. H'0000: — H'0001: 1 × 512 bit time H'0002: 2 × 512 bit time : : H'FFFF: 65535 × 512 bit time A bit time changes relative to the transfer speed as follows. 1000 Mbps: 1 bit time = 1 ns 100 Mbps: 1 bit time = 10 ns |

46.2.92 Manual PAUSE Frame Register (MPR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The MPR register is used to set the value for the TIME parameter of manually generated PAUSE frames. When a PAUSE frame is manually transmitted, the value set in this register is used as its TIME parameter.

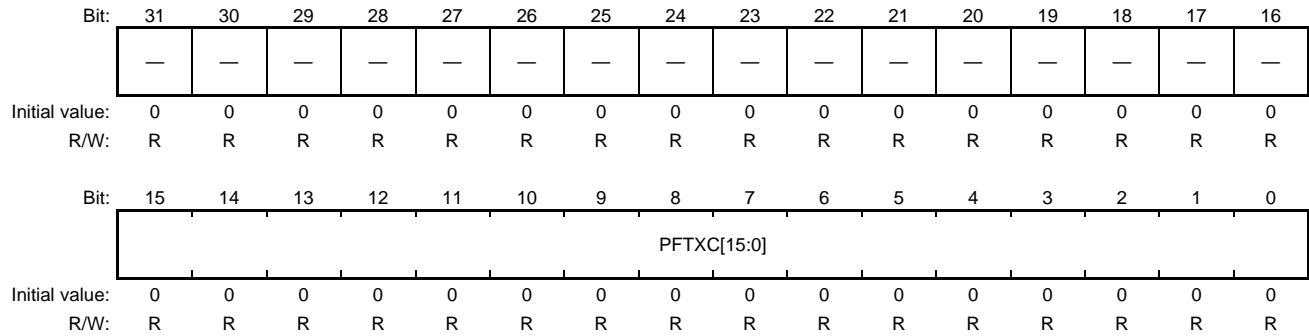

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | MP[15:0] | H'0000 | R/W | Manual PAUSE These bits set the value of the TIME parameter in manually generated PAUSE frames. The unit for the setting is 512 bit time. These bits set the TIME parameter value of a manual PAUSE frame. H'0000: — H'0001: 1 × 512 bit time H'0002: 2 × 512 bit time : : H'FFFF: 65535 × 512 bit time A bit time changes relative to the transfer speed as follows. 1000 Mbps: 1 bit time = 1 ns 100 Mbps: 1 bit time = 10 ns |

46.2.93 PAUSE Frame Transmit Counter (PFTCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The PFTCR register is a counter that indicates the number of times PAUSE frames have been transmitted.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | PFTXC[15:0] | H'0000 | R | PAUSE Frame Transmit Counter Counter for counting the number of transmitted PAUSE frames The bits are cleared to 0 when they are read. If counting up and clearing of the counter coincide, clearing the counter takes priority. |

46.2.94 PAUSE Frame Receive Counter (PFRCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RFRCCR register is a counter that indicates the number of times PAUSE frames have been received.

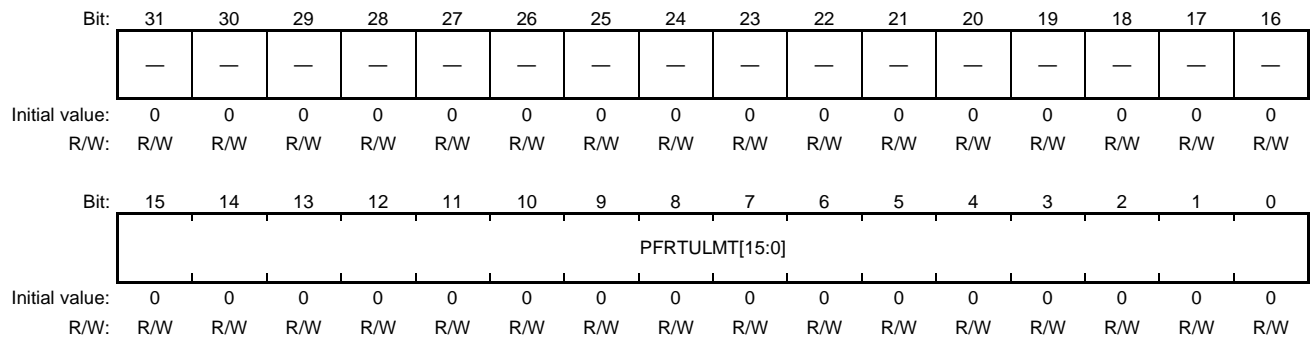

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | PFRXC[15:0] | H'0000 | R | PAUSE Frame Receive Counter These bits indicate the number of PAUSE frames that have been received when flow control in reception is enabled (the RXF bit in ECMR = 1). The bits are cleared to 0 when they are read. If counting up and clearing the counter coincide, clearing the counter takes priority. |

46.2.95 Automatic PAUSE frame retransmit count register (TPAUSER)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TPAUSER register is used to set the value for upper limit number of auto generated PAUSE frames.

The setting in this register must not be changed while transmission is enabled.

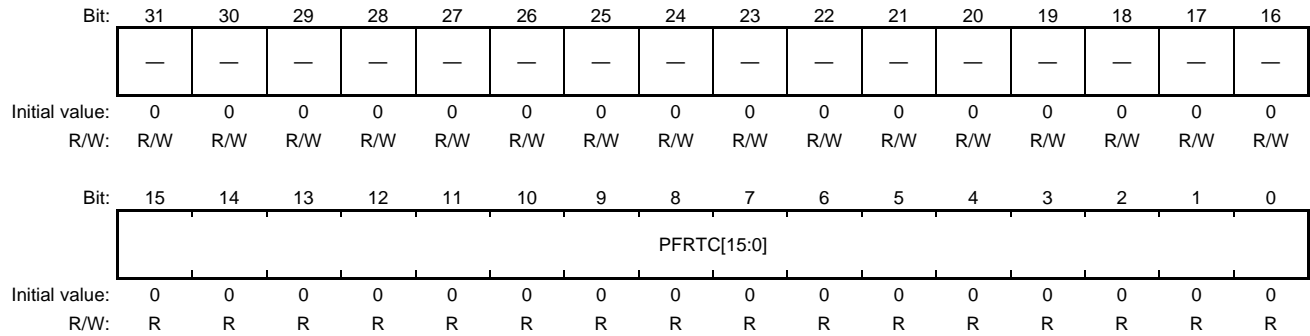

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------------|---------------|-----|---|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | PFRTULMT [15:0] | H'0000 | R/W | Pause Frame Retry Upper LiMiT These bit's set the value for upper limit time of auto generated PAUSE frames while Receive FIFO caution. H'0000: unlimited H'0001: 1 time H'0002: 2 times : : H'FFFF: 65535 times |

46.2.96 PAUSE frame transmit times counter (PFTTCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The PFTTCR register is a counter that indicates the number of times auto PAUSE frames have been transmit.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | PFRTC[15:0] | H'0000 | R | Pause Frame Retry Counter These bits indicate the number of auto PAUSE frames that have been transmit while Receive FIFO caution. The bits are cleared to 0 when they are read and Receive FIFO caution start. |

46.2.97 E-MAC Mode Register 2 (GECMR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The GECMR register specifies the operating mode for the E-MAC.

The setting in the GECMR register must not be changed while transmission or reception is enabled.

| | | | | | | | | | | | | | | | | |
|----------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SPEED |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

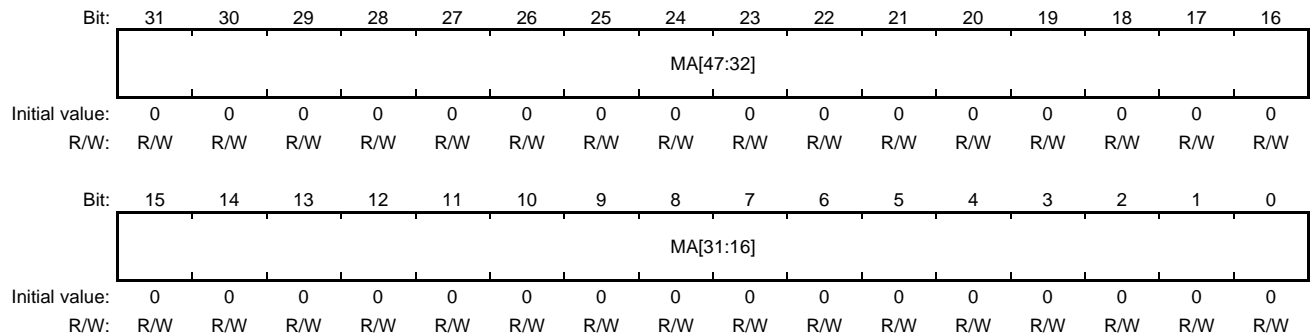

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 0 | SPEED | B'0 | R/W | Transfer Speed Setting This bit sets the transfer rate. 0: Transfer is at 100 Mbps. 1: Transfer is at 1000 Mbps. |

46.2.98 E-MAC Address High Register (MAHR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The MAHR register specifies the 32 higher-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 0 | MA[47:16] | H'0000_0000 | R/W | E-MAC Address Bits 47 to 16 These bits are used to set the 32 higher-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'0123_4567 in the MAHR register. |

46.2.99 E-MAC Address Low Register (MALR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The MALR register specifies the 16 lower-order bits of the 48-bit E-MAC address. The settings in this register are normally made in the initialization process after a reset.

The settings in this register must not be changed while transmission or reception is enabled.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 16 | — | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | MA[15:0] | H'0000 | R/W | E-MAC Address Bits 15 to 0 These bits are used to set the 16 lower-order bits of the E-MAC address. For example, if the E-MAC address is 01-23-45-67-89-AB (hexadecimal), set H'89AB in the MALR register. |

46.2.100 Transmit retry over counter register (TROCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TROCR register is a counter that indicates the number of times frames with time-out were transmit. Counting up stops when the value in this register reaches H'FFFF_FFFF.

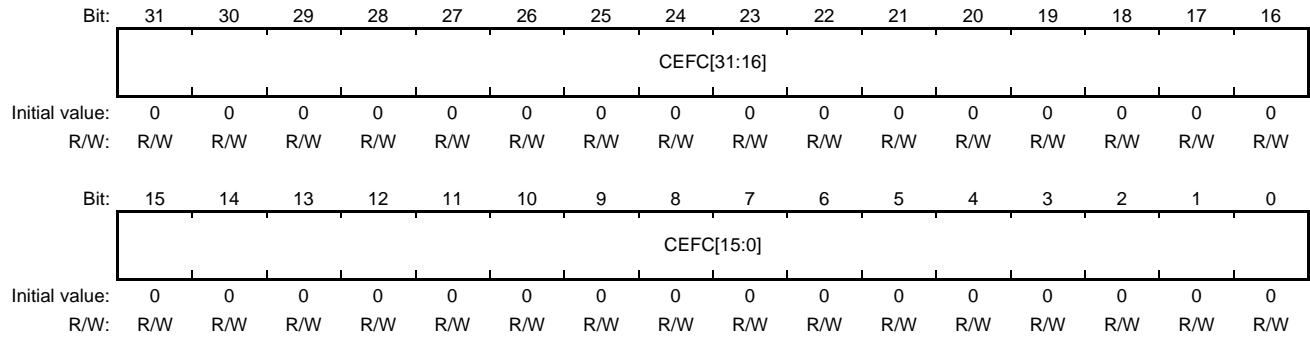

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 16 | FTTOC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | FTTOC [15:0] | H'0000 | R/W | Frame transmit time-out counter These bits indicate the number of transmit frames having time-out. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.101 CRC Error Frame Receive Counter Register (CEFCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CEFCR register is a counter that indicates the number of times frames with CRC errors were received. Counting up stops when the value in this register reaches H'FFFF_FFFF.

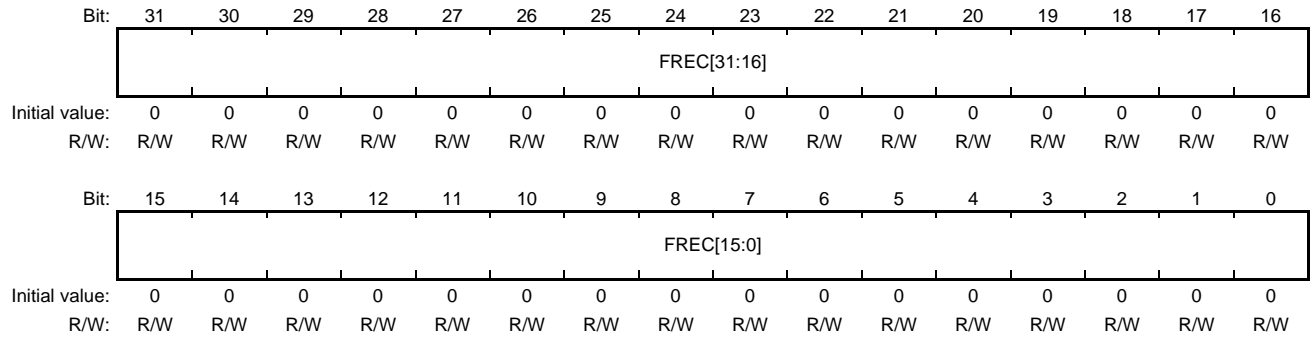

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | CEFC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | CEFC[15:0] | H'0000 | R/W | CRC Error Frame Counter These bits indicate the number of received frames having CRC errors. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.102 Frame Receive Error Counter Register (FRECR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The FRECR register is a counter that indicates the number of frames for which receive errors were generated by input on the RX_ER from the PHY-LSI. Counting up stops when the value in this register reaches H'FFFF_FFFF.

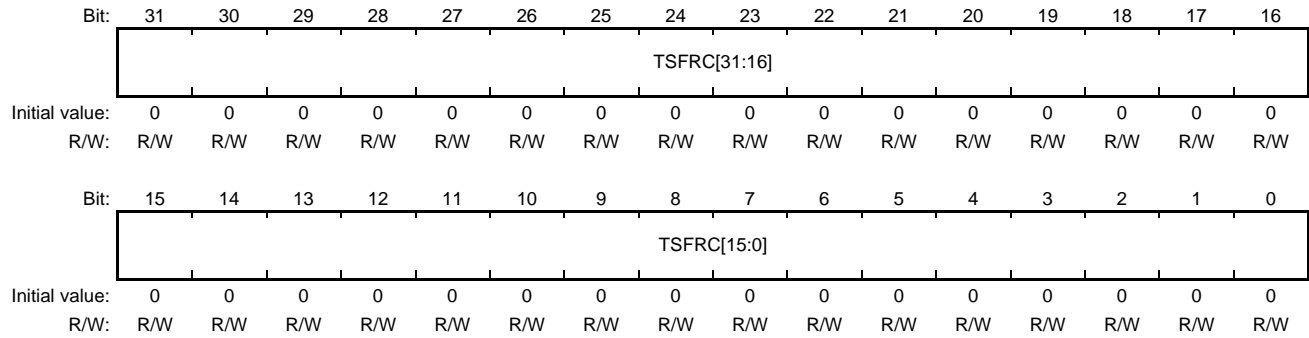

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 16 | FREC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | FREC[15:0] | H'0000 | R/W | Frame Receive Error Counter These bits indicate the number of errors during frame reception. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.103 Too-Short Frame Receive Counter Register (TSFRCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TSFRCR register is a counter that indicates the number of received frames that were fewer than 64 bytes in length. Counting stops when the value in this register reaches H'FFFF_FFFF.

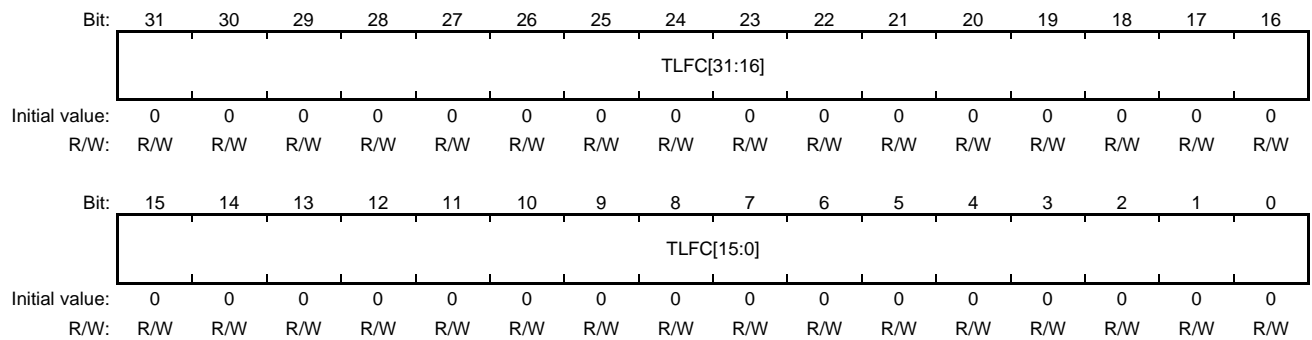

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------|---------------|-----|---|
| 31 to 16 | TSFRC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | TSFRC[15:0] | H'0000 | R/W | Too-Short Frame Receive Counter These bits indicate the number of received frames that were fewer than 64 bytes in length. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.104 Too-Long Frame Receive Counter Register (TLFRCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The TLFRCR register is a counter that indicates the number of received frames that were longer than the value specified in the receive frame length register (RFLR). Counting up stops when the value in the TLFRCR register reaches H'FFFF_FFFF.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | TLFC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | TLFC[15:0] | H'0000 | R/W | Too-Long Frame Receive Counter These bits indicate the number of received frames that were longer than the value in RFLR. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.105 Residual-Bit Frame Receive Counter Register (RFCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The RFCR register is a counter that indicates the number of received frames containing “residual bits” (trailing bits not making up an 8-bit unit). Counting up stops when the value in this register reaches H'FFFF_FFFF.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 16 | RFC[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | RFC[15:0] | H'0000 | R/W | Residual-Bit Frame Receive Counter These bits indicate the number of received frames containing residual bits. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.2.106 Multicast Address Frame Receive Counter Register (MAFCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The MAFCR register is a counter that indicates the number of received frames for which a multicast address was specified. Counting up stops when the value in this register reaches H'FFFF_FFFF.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | MACF[31:16] | All 0 | R/W | Reserved These bits are read as 0. The write value should be 0. |
| 15 to 0 | MAFC[15:0] | H'0000 | R/W | Multicast Address Frame Counter These bits indicate the number of multicast frames that have been received. The bits are cleared to 0 when they are read while the counter clear mode bit (TRCCM) in the E-MAC mode register is set to 1. When TRCCM = 0, they are cleared to 0 by the writing of any value to this register. |

46.3 Operation

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

The EthernetAVB-IF consists of the following functional units:

- DMA transfer controller (AVB-DMAC): Handles DMA transfer between the data storage areas for reception and transmission in the URAM and the reception and transmission FIFO buffers
- MAC controller (E-MAC): Handles transfer between the reception and transmission FIFO buffers and the RGMII

Using its direct memory access (DMA) function, the AVB-DMAC handles DMA transfer of frame data between the destinations for storing Ethernet frame data for transmission and reception in the URAM and the FIFO buffers for reception and transmission. Data cannot be directly read from or written to the FIFO buffers.

To handle DMA transfer, the AVB-DMAC requires information that includes the addresses for storage of data for transmission and received data. These data are referred to as descriptors. The AVB-DMAC reads data for transmission from the storage area for data to be transmitted according to the information in descriptors and writes received data to the storage area for received data accompanied by information in descriptors. The descriptors are placed in the URAM. Arranging multiple descriptors in descriptor lists allows the continuous reception or transmission of multiple Ethernet frames.

The E-MAC supports a RGMII, which provides an interface format for the externally connected PHY-LSI. The E-MAC constructs Ethernet frames from data written to the transmission FIFO and transmits these frames to the RGMII. It also performs CRC checking of Ethernet frames received from the RGMII and writes the frames to the reception FIFO.

46.3.1 AVB-DMAC Operating Modes

Figure 46.2 illustrates the operating modes of the AVB-DMAC.

Transitions of AVB-DMAC operating mode are under the control of the items listed below.

- CPU operating mode (hardware reset and power-down mode)
- Configuration of the operating mode configuration bits (CCC.OPC) in the AVB-DMAC mode register

The current operating mode can be confirmed by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

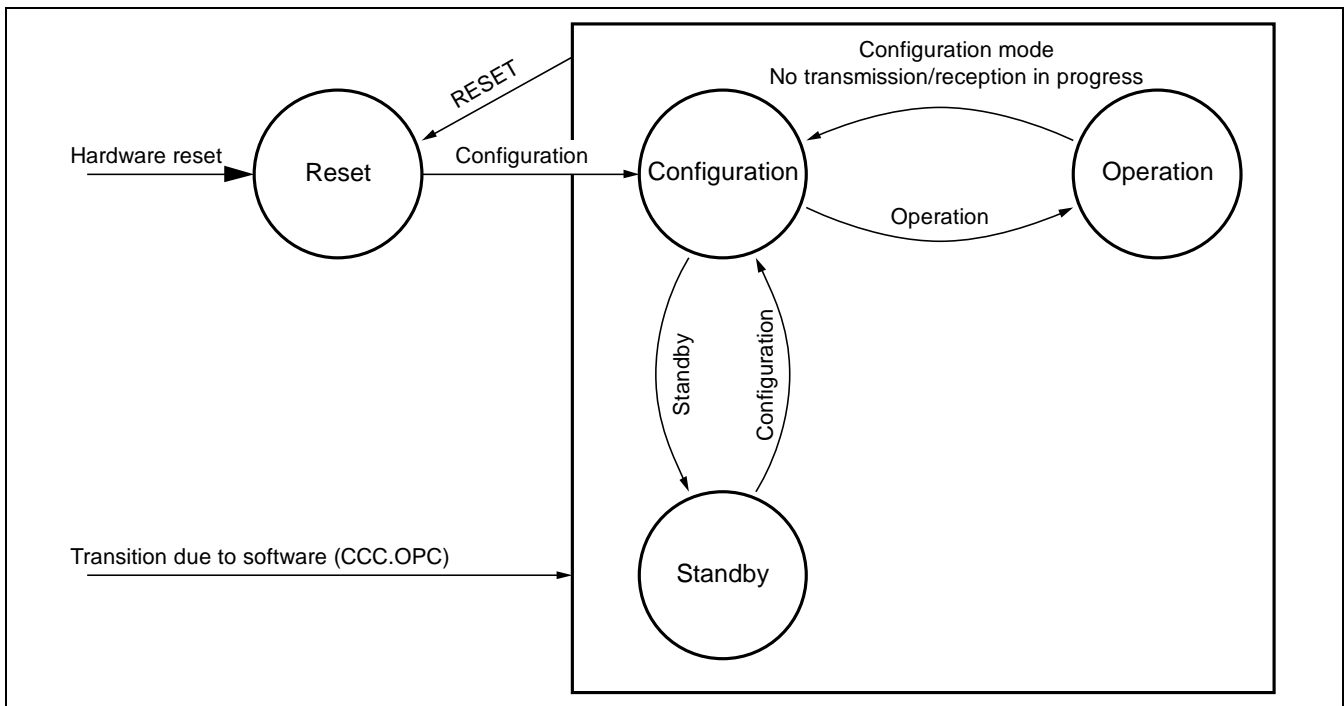

Figure 46.2 Operating Mode of AVB-DMAC

(1) Operating Modes

(a) Reset mode

After a hardware reset, the AVB-DMAC enters reset mode.

In reset mode, only the AVB-DMAC operating mode control function is controllable and other functions are all stopped. This mode is designed for reduced power when the Ethernet function is not necessary.

(b) Configuration mode

In configuration mode, various settings for the AVB-DMAC can be made.

The operation of most functions is stopped and all status registers are initialized to their reset values. The E-MAC functions in this mode.

By CCC.GAC it is possible to enable gPTP support already in CONFIG mode.

(c) Operation mode

In operation mode, all functions of the AVB-DMAC can operate. Ethernet communications can only proceed in this mode.

(d) Standby mode

In standby mode, the E-MAC can only be used to control the operating mode. Other functions cannot be used. When CCC.GAC is 1 CPU should not enter STANDBY mode.

(2) How to Set the Operating Mode

Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to select the operating mode. Furthermore, the current operating mode can be checked by reading the operating mode status bits in the AVB-DMAC status register (CSR.OPS).

Transitions other than from operation mode to configuration mode are made after the value is written to the operating mode configuration bits (CCC.OPC) (Figure 46.3).

For transitions from operation mode to configuration mode, follow the procedure in Figure 46.4 because any transmission and reception in progress will be executed before the transition to configuration mode.

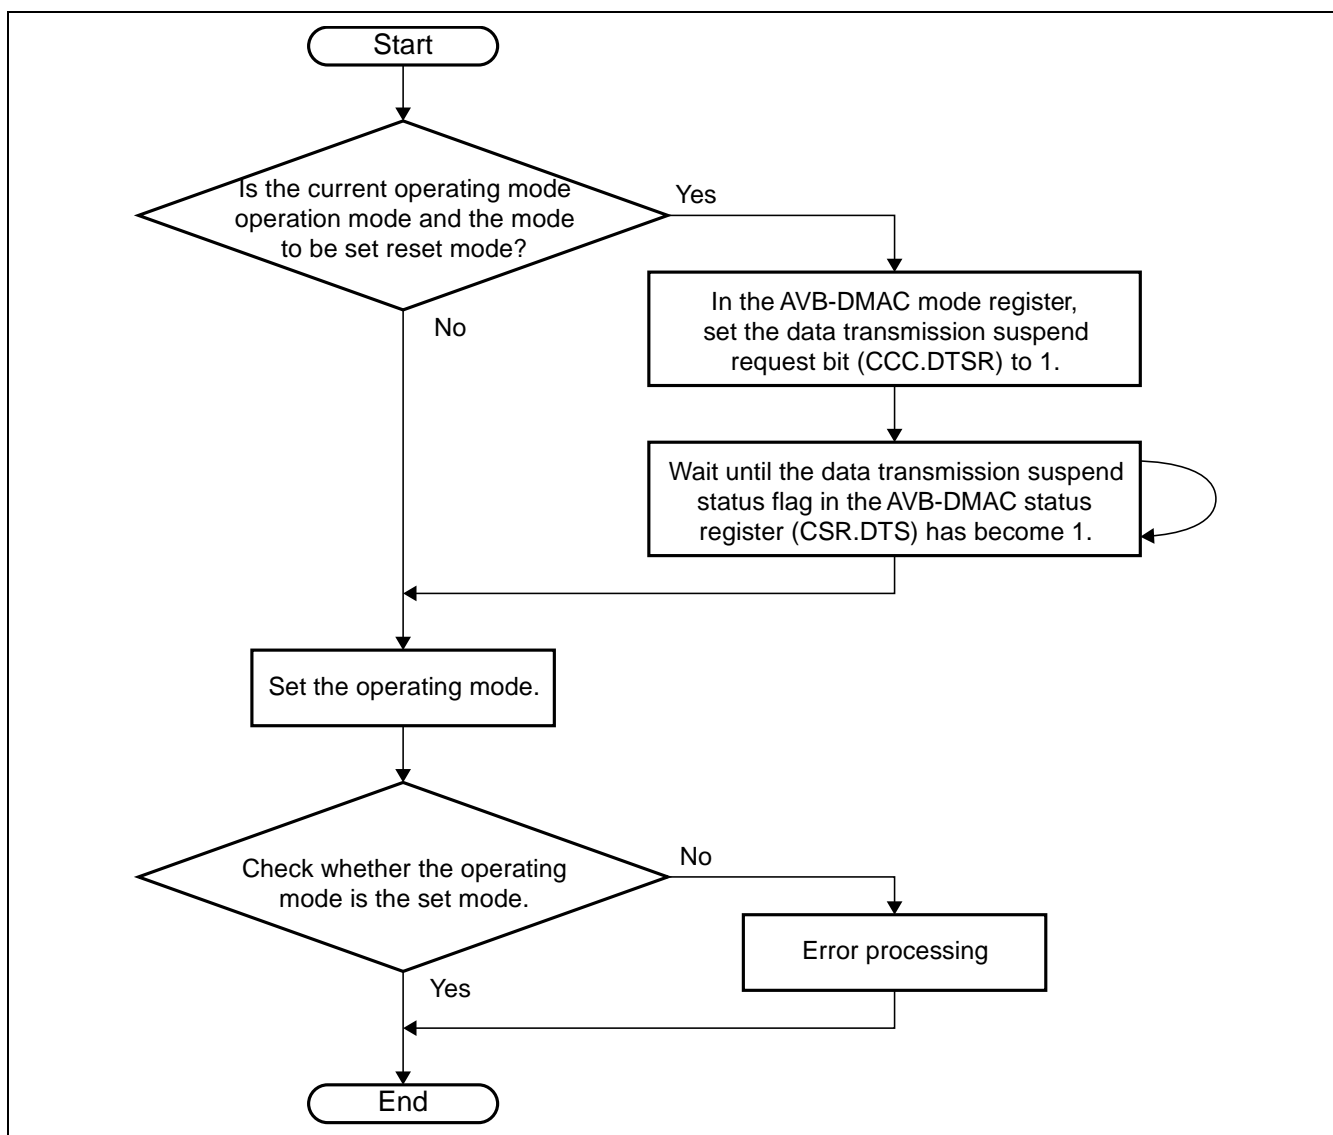

Figure 46.3 Flow for Transitions of Operating Mode (Other than from Operation Mode to Configuration Mode)

**Figure 46.4 Flow for Transitions of Operating Mode
(from Operation Mode to Configuration Mode)**

In the transition from operation mode to configuration mode, the AVB-DMAC executes the following operations before the transition is completed. Read the operating mode status bits in the AVB-DMAC status register (CSR.OPS) to check that the transition to configuration mode has been completed.

- If the transfer of a frame between the reception FIFO and URAM is in progress, this is completed (other received frames remaining in the FIFO and any frames that are subsequently received by the E-MAC are discarded).
- If the transfer of a frame is in progress between the transmission FIFO and URAM, this is completed (frames for transmission remaining in the URAM will not be transmitted).
- All frames for transmission in the transmission FIFO are transferred to the E-MAC.

The CPU should not disable URAM transfers by CCC.DTSR nor prevent transmission by MAC when requesting transition from OPERATION to CONFIG, else EthernetAVB-IF cannot perform requested mode change.

Notes: When the operating mode shifts to configuration mode, all status registers are cleared.

When need status register information, the reception and transmission path can be individually disabled and can check the status before leaving operating mode with follow.

We recommend following the procedure below in the case of this transition.

1. Disable reception.
2. Since reception actually stopping after being disabled requires time, wait for an interval equivalent to that for reception of a maximum length packet.
3. Stop the software task that is generating data for transmission.
4. Wait until the receive process status bit (CSR.RPO) and the transmit process status bits (CSR.TPO0 to 3) in the AVB-DMAC status register are set to 0.
5. Capture all of the required status information.
6. Set the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) to initiate the transition to configuration mode.

(3) Leave RESET mode with additional configuration

When writing B'01 (CONFIG) to CCC.OPC while EthernetAVB-IF is in RESET mode, it is possible to configure availability of gPTP support within CONFIG mode

To enable gPTP support in CONFIG mode use a 32 bit write access when setting CCC.OPC to B'01. This write should also set CCC.GAC to 1 and CCC.CSEL to intended configuration.

(4) Operating Mode Transitions Due to Hardware

The following hardware factors can also initiate transitions of the AVB-DMAC operating mode.

(a) Hardware reset

Resetting of the LSI chip leads to resetting of the entire EthernetAVB-IF module. The operating mode shifts to reset mode.

(b) Transition during power-off by module standby

This transition is triggered by module standby of CPG during the power-off sequence.

The AVB-DMAC completes the bus master access in progress, and then shifts to reset mode. At this time, the operating mode configuration bits in the AVB-DMAC mode register (CCC.OPC) are set to B'00.

46.3.2 Common Control for Transmission and Reception

(1) Initialization Procedure

Figure 46.5 shows the overall initialization procedure in outline.

Figure 46.5 Outline of the Initialization Procedure

Note: Before starting configuration, all required clocks should be configured and enabled.

(a) Initializing the Receiver Section

Before starting reception, follow the procedure below.

Keep the operating mode to configuration mode, and do not enable reception until the settings for the AVB-DMAC are completed.

- Set the operating mode to configuration mode.
- Set AVB filtering for network control frames and AVB stream frames to suit the specifications of the product the chip will be used in.
- Create a descriptor chain for each queue to be used.
- Set the base address for table address in the descriptor base address table register (DBAT).
- Specify the maximum frame length with the receive frame length upper limit register (RFLR).
- Specify whether padding is to be used with the receive padding configuration register (RPC).
- Set the unread frame counter for each queue with unread frame counter registers (UFCVs) 0 to 4.

(b) Initializing the Transmitter Section

Figure 46.6 illustrates initialization of the transmitter section.

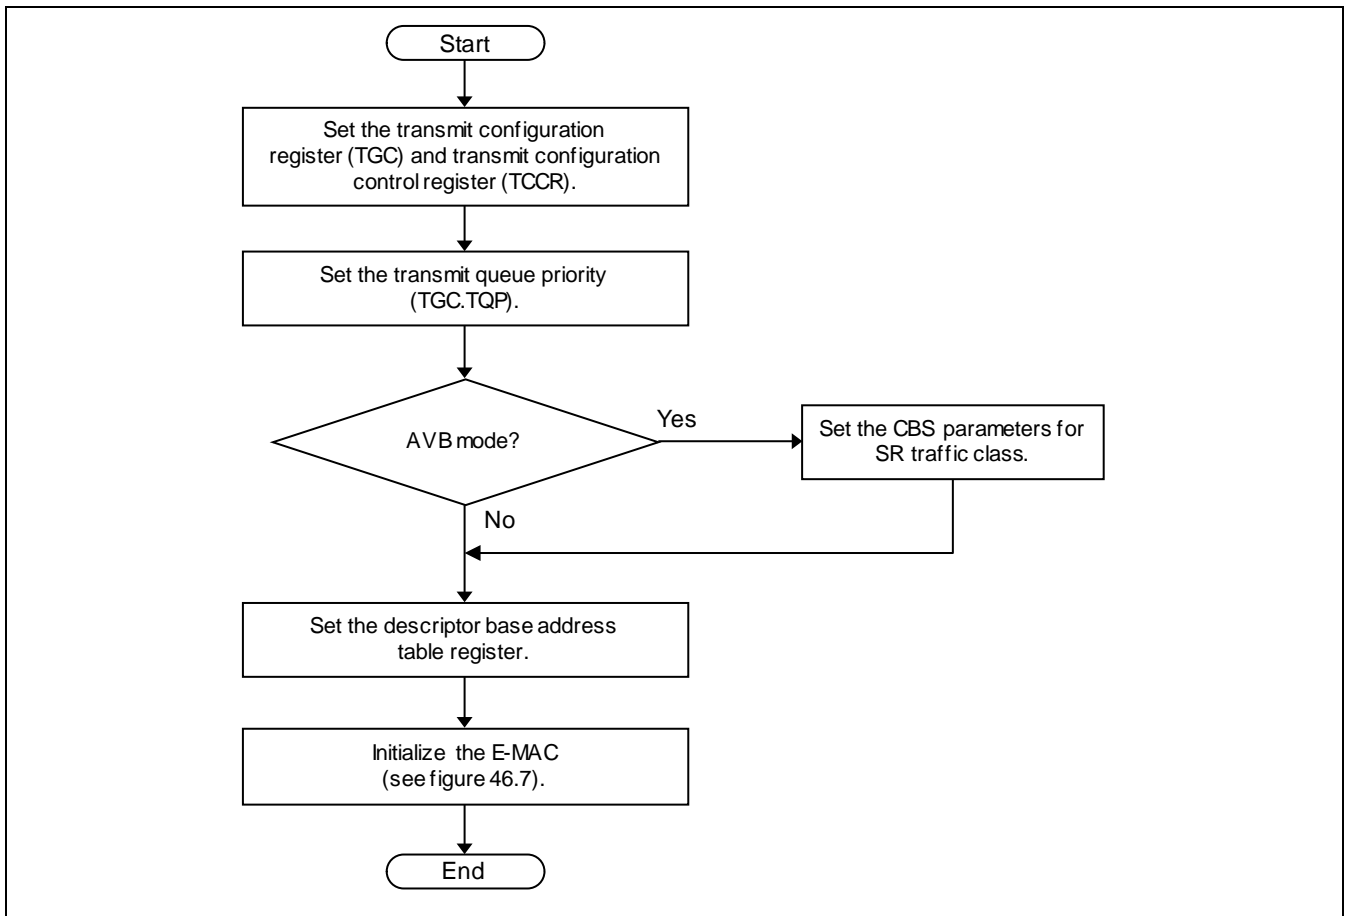

Figure 46.6 Procedure for Initializing the Transmitter Section

(c) Initializing the E-MAC Section

Figure 46.7 illustrates initialization of the E-MAC section.

Figure 46.7 Procedure for Initializing the E-MAC Section

(d) Initialization of the Application Unit

Figure 46.8 illustrates initialization of the application unit.

For a description of how to set up the descriptors and the CBS traffic shaping parameters, see section 46.3.3 Descriptors, and section 46.3.6 CBS (Credit-Based Shaping).

Figure 46.8 Initializing the Sections for Use by the Application

(e) Relationship between Transmission Queue Numbers and Traffic Classes

In fetching, the relationships between the transmission queues and traffic classes are fixed, so the priority specified by the transmit queue priority bits in the transmit configuration register (TGC.TQP) has no effect.

Figure 46.9 Class Associations of Queues for the Scheduler

In fetching, the credit values for stream classes A and B are not taken into account. Behavior depends on the setting of the transfer FIFO size configuration bits in the transfer configuration registers (TGC.TBDt) and on the frame size that can be fetched to the transmission FIFO.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'00 or B'01, the priority order is Q3 → Q2 → Q1 → Q0.

When the transmit queue priority bits in the transmit configuration register (TGC.TQP) are B'11, the priority order is Q1 → Q3 → Q2 → Q0.

(2) Checking Integrity

The AVB-DMAC is capable of detecting and identifying errors produced in the processing of Ethernet frames and in the transfer of frame data for transmission and reception.

(a) Concept of Integrity Checking in Reception

The aim of integrity checking in reception is preventing the storage of error frames in the URAM. If an error frame is stored in the URAM, software can get information to identify the frame as an error frame.

Note: If a special descriptor chain is to be used for separation of received headers from the associated data, an error that breaks the sequence may lead to storage space for synchronization running out. In such cases, software interaction or re-synchronization via the EOS descriptor is required.

(b) Concept of Integrity Checking in Transmission

The purpose of integrity checking in transmission is to prevent the transmission of broken frames.

Since transmission of a frame by the E-MAC can neither be stopped nor disabled once it has started, this check involves intensive monitoring for problems that can arise during fetching.

(c) Items for Monitoring in Both Reception and Transmission

Errors in access to the URAM for reading of descriptors

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to read descriptors from the URAM are detected from the response signal of the AXI-Bus. EthernetAVB-IF flags only one access error per descriptor read.

Illegal configuration of a descriptor by an application

The same descriptor may be processed again because the current descriptor address (CDARq.CDA) was not changed. If this problem occurs in a divided frame, the sequence may be broken.

In reception

- The received frame will be lost.
- The same problem will occur for the next frame of data received for the same queue.

In transmission

- The transmit start request bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.
- The frame will be lost from the transmission FIFO.

Errors in access to the URAM for writing of descriptors

As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) are updated.

As DESC.DT was not updated, hardware and software synchronization may have been destroyed.

Errors in access to write descriptors to the URAM are detected from the response signal of the AXI-Bus.

(d) Items for Monitoring in Reception

Errors in access to the URAM for writing of data or time stamps

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) is updated.
- DESCR.EI is set to indicate incorrect contents.
- This problem occurring in a divided frame may break the descriptor sequence, making the queue unusable.

Errors in access to write data or descriptors to the URAM are detected from the response signal of the AXI-Bus. EthernetAVB-IF flags each access error individually, even they are related to same frame.

Error of the Reception FIFO

- Received frames are all invalidated.
- All frames stored as received frames are discarded. At this time, the number of frames and queue information cannot be captured.

If the reception FIFO RAM faults, AVB-DMAC detects the fault as error of the reception FIFO.

Queue Synchronisation Fault of the Reception

EthernetAVB-IF will not continue splitting frame across EOS descriptor. A queue synchronisation fault is detected when read descriptor with DESCR.DT = EOS at position where FMID, or FEND should be written

- RIS2.QFFr is set 1
- CDARq.CDA is updated as in fault free operation.
- Neither CIARr.CIA nor LIARr.LIA is changed.
- Neither UFCVi.CVr nor RIS0.FRr is changed.
- Received frame is lost. There is an incomplete frame (no FEND) in descriptor chain.

Note: Reading descriptor may be one or more storage elements ahead in descriptor chain.

(e) Items for Monitoring in Transmission

Errors in Access for Reading Data from the URAM

- Data that have already been fetched are discarded from the transmission FIFO.
- When an error of this type occurs during processing of an FSINGLE or FEND descriptor:
As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- When an error of this type occurs during processing of an FSTART or FMID descriptor:
— The current descriptor address (CDARq.CDA) is not updated.
— The transmit start bit in the transmit configuration control register (TCCR.TSRQt) is set to 0.

Errors in access to read data from the URAM are detected from the response signal of the AXI-Bus.

Overflow of the Transmission FIFO

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.
- The frame will be discarded from the FIFO.

Frame size error during transmission

- As in the case where no error occurs, the current descriptor address (CDARq.CDA) and the transmit start bit in the transmit configuration control register (TCCR.TSRQt) are updated. Fetching resumes after the error frame.

A transmit frame size error is detected when the size setting in one or more (in the case of a divided frame) descriptors for frame transmission is 1966 or more bytes. Such frames are cut out and transmitted.

Damaged Data in the Transmission FIFO

- Fetching is not affected by damaged data.
- Since damaged data from the FIFO is only detected during frame transmission, an error frame may be transmitted.

If damaged data in the transmission FIFO is an error due to the transmission FIFO, this is detected by the AVB-DMAC.

(f) Items for Monitoring in gPTP**Access error while reading AVTP timestamps from Tx-Buffer RAM**

- AVTP timestamps are invalidated.
- gPTP unit ignores the issue. It uses the value as read for AVTP comparison.

An access error when reading timestamps from Tx-Buffer RAM is flagged to EthernetAVB-IF by external RAM protection logic.

46.3.3 Descriptors

(1) Data Representation in URAM

The AVB-DMAC transfers data for transmission and received data to and from the application software via the URAM.

The memory in the URAM for use by the AVB-DMAC is configured with control structures referred to as descriptors and associated areas to which the frame data are allocated. Dividing the memory into a control area and data area allows the flexible allocation of frame data to the URAM. This enables sharing of the areas to which frame data are allocated and the use of non-contiguous areas. Frame data can be copied without using the CPU. Arbitration that ensures hardware and software access to the memory area is also available without access to registers of the AVB-DMAC.

Figure 46.10 shows an example of the memory maps for descriptors and the descriptor data area in the URAM.

A descriptor consists of its type (DESCR.DT), which controls the descriptor functions, a descriptor pointer (DESCR.DPTR) indicating the start address for storage of the frame data in the descriptor area, and the data size field (DESCR.DS), indicating the amount of frame data. Post-processing interrupt generation can be set up for each descriptor. Enabling and disabling of the interrupt is controlled by the descriptor interrupt enable bits (DESCR.DIE).

The descriptor may also hold information related to content. This information does not affect general descriptor functions. It provides information other than the frame data proper, such as on the state of reception.

For details, see section 46.3.4(2) Setting Up Reception Descriptors, and section 46.3.5(2) Setting Up Transmission Descriptors.

Figure 46.10 Outline of Storage Element Used for Receive and Transmit Queues

The descriptor must be aligned with a 32-bit boundary in the URAM.

Descriptors are generally configured of 64 bits, but are configured of 160 bits when reception and storage of gPTP time stamps is enabled.

The amount of data in the frame is defined by the data size bits (DESCR.DS). In reception, these bits indicate the upper limit on the size of frames to be received. If the data size is not aligned with a 32-bit boundary, the bytes to the next 32-bit boundary in the data area will be an unused area.

(2) Using Descriptor Chains in Queues

Transmission and reception descriptors in the URAM are grouped into queues. Each queue handles frames so that they are transmitted in order of priority and received separately. A queue is capable of controlling one or more frames. Accordingly, multiple descriptors can be assigned to one queue. A combination of multiple descriptors is referred to as a descriptor chain.

For a descriptor chain, the three general descriptor types listed below are defined. For details on these descriptor types, see section 46.3.3(6) Descriptor Type.

- Descriptors that define frame data
- Descriptors that control the descriptor chain itself (e.g. LINK, EOS).
- Descriptors that arbitrate access by hardware or software

Figure 46.11 shows the two basic topologies for descriptor chains. In the simplified examples in the figure, all descriptors allocated to the chain are stored in the array.

- For a linear descriptor chain, the last descriptor in the array is a control descriptor indicating the end of the descriptors (e.g. EEMPTY).
- For a cyclic descriptor chain, the last descriptor in the array is a control descriptor that returns to the first descriptor in the array (e.g. LINK).

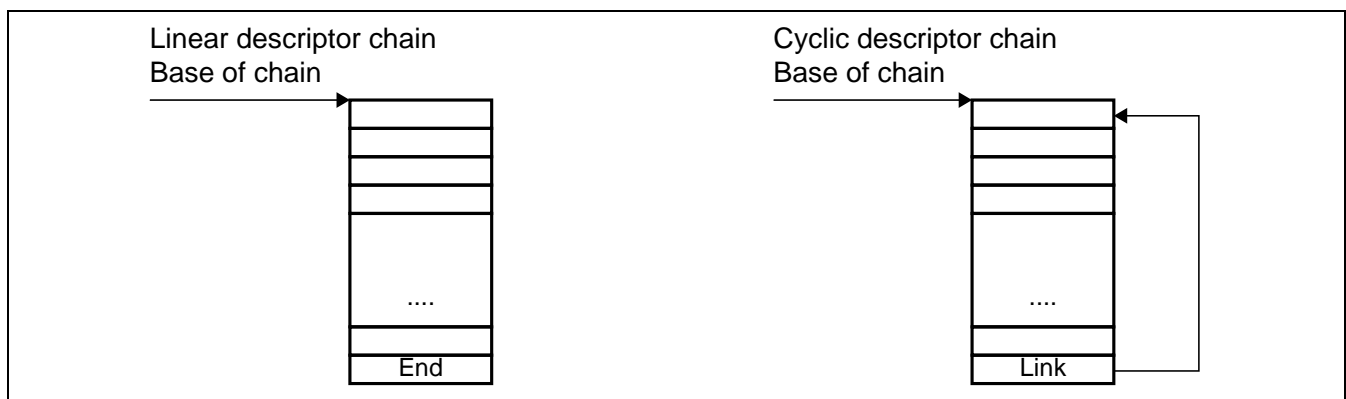

Figure 46.11 Outline of the Basic Descriptor Chains

The relationship between queues and descriptor chains is defined by the base addresses of chains. A queue is connected to one descriptor chain over one round of processing. There is also a method of switching to a different chain while in operation mode.

There are no restrictions on the number of link descriptors and their locations within the chain. The last descriptor of a designed chain determines the topology.

Which chain structure is to be used or which topology is suitable depends on the application. A description of how to design descriptor chains to suit various applications is given in section 46.3.4(2) Setting Up Reception Descriptors, and section 46.3.5(2) Setting Up Transmission Descriptors.

(3) Descriptor Base Address Table

The base address table in the URAM contains the address of the first descriptor of all chains to be handled by the respective queues.

Entries 0 to 3 are used to access transmission queues 0 to 3. Subsequent entries are used to access reception queues. Entry 4 thus corresponds to reception queue 0.

The configuration of entries in the base address table is the same as the configuration of link descriptors. We recommend using the descriptor type (DESCR.DT) LINKFIX. Processing of this link descriptor does not change it, so it does not require updating. The first descriptor of a chain performs hardware and software synchronization. If the application requires hardware and software synchronization for the base addresses, use the descriptor type (DESCR.DT) LINK.

The CPU is only capable of using LINKFIX and LINK as descriptor types (DESCR.DT) of descriptors in the base address table.

Set the location of the base address table in the URAM in the descriptor base address table register (DBAT).

Figure 46.12 shows an example of a base address table for controlling four transmission and three reception queues. The boxes to the right of the table represent descriptor chains with the desired topologies.

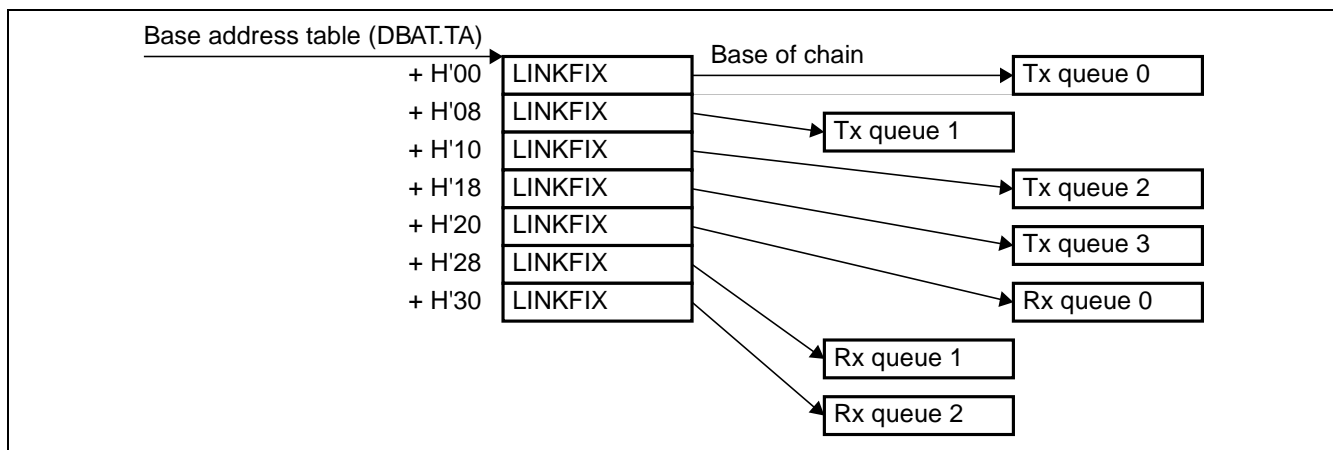

Figure 46.12 Example of a Base Address Table for Reception and Transmission Queues

Note: The size of the descriptors in the base address table is always eight bytes even if the queue itself includes extended descriptors.

(4) Descriptor Chain Processing

The descriptor that is currently processed or will be processed when the related queue gets active is the current descriptor. The current descriptor address for use by a queue q can be checked in the current descriptor address register q (CDARq).

Current descriptors are stored in registers or in descriptors as described below in the given situations.

- In the descriptor base address table registers for all q queues (DBAT) (DBAT.TA+8*q) when the operating mode shifts to operation mode.
- In the descriptor base address table register (DBAT) (DBAT.TA+8*q) when a base address load request is issued for a queue q by setting the corresponding bit (DLR.LBAq) in the descriptor base address load request register (DLR).
- In DESC.DPTR for a link descriptor (LINK, LINKFIX) to be processed.
- After a descriptor has been processed, the current descriptor for the same queue is incremented by the size of the descriptors being handled by the queue (8 bytes for normal descriptors and 20 bytes for extended descriptors). The AVB-DMAC updates the descriptor type and informs the CPU that the descriptor has been processed.

(5) Descriptor Interrupts

A descriptor is able to issue a descriptor interrupt on completion of its processing. The setting of the descriptor interrupt enable bits (DESCR.DIE) in each descriptor selects disabling or generation of the descriptor interrupt.

EthernetAVB-IF provides two kinds of descriptor interrupts:

- Queue specific descriptor interrupt (1 per receive/transmit queue)
- Universal descriptor interrupt (15 shared between all receive/transmit queues)

The descriptor interrupt is a common resource that is shared between reception and transmission queues. Software control of the descriptor interrupt provides a flexible method of application-specific flag processing.

Figure 46.13 illustrates the way in which the AVB-DMAC generates descriptor interrupts (or sets bits in the descriptor interrupt status register (DIS.DPFi)). Processing of a descriptor with the value i in the descriptor interrupt enable bits (DESCR.DIE) leads to the corresponding bit in the descriptor interrupt status register (DIS.DPFi) being set.

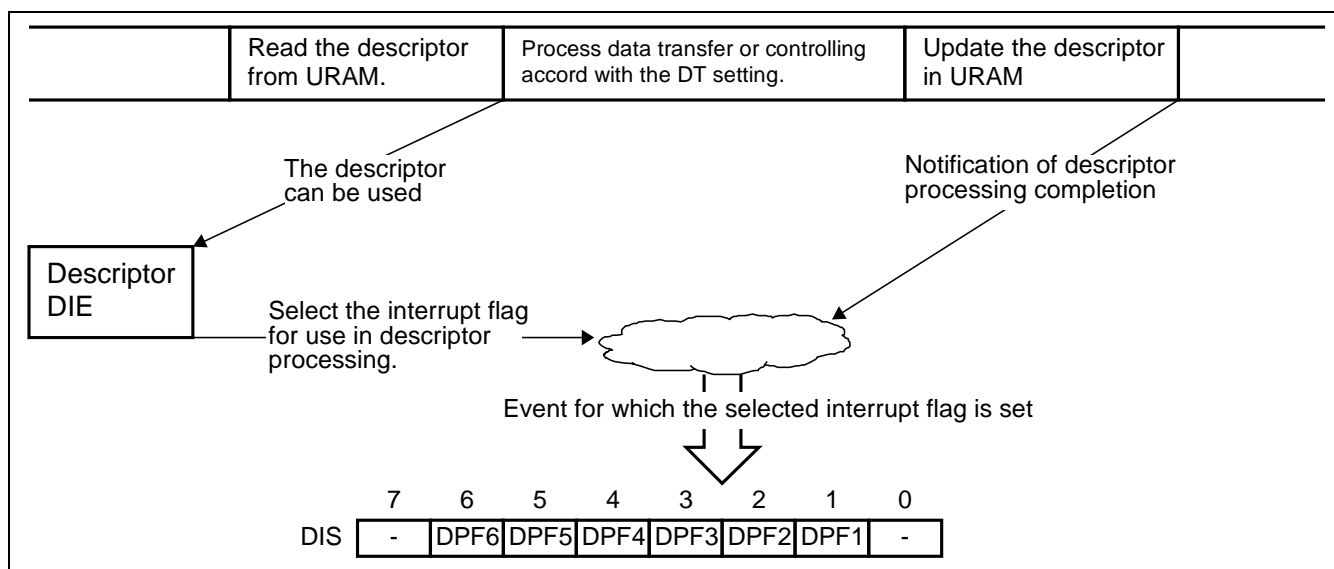

Figure 46.13 Method of Descriptor Interrupt Generation

(6) Descriptor Type

The descriptor types (indicated by the DESCR.DT bits) supported by the AVB-DMAC fall into the following three categories.

- Definitions of frame data
- Control of descriptor chains
- Hardware and software arbitration

Table 46.7 is a summary of the descriptor types available for the AVB-DMAC. Entries under “Name” are the names of the descriptor types and the values under “DT” are the corresponding values to be set in the descriptor type field (DESCR.DT). A given descriptor may be handled differently according to whether it is in a transmission or reception queue, so the transmission and reception columns list the scopes of control and processing of the descriptor types.

The abbreviations defined below are used in the transmission and reception columns.

Definition of SW:

- The descriptor is processed by software.
- Software has access to and may modify the descriptor and descriptor data area.
- This descriptor cannot be changed by hardware (AVB-DMAC).

Definition of HW:

- The descriptor is processed by hardware (AVB-DMAC).
- Software must modify neither the descriptor nor the descriptor data area.
- Hardware (AVB-DMAC) processes this descriptor and subsequently changes the descriptor type.

Invalid:

This descriptor type is not used in transfer in the given direction (transmission or reception).

Do not write this value to the descriptor type (DESCR.DT) field for transfer in the given direction.

Hardware does not process these descriptor types in the cases listed as invalid. The current descriptor address (CDARq.CDA) will not be changed when processing of a queue for the given direction arrives at a descriptor with this type setting.

Table 46.7 Summary of Descriptor Types

| Name | DT | Description | Reception | Transmission |
|-------------------|----|--|-----------|--------------|
| Frame data | | | | |
| FSTART | 5 | Frame Start The descriptor points to valid data for a frame. The frame starts with the given data and continues with that indicated by the next descriptor. | SW | HW |
| FMID | 4 | Frame Middle The descriptor points to valid data for a frame. The frame started with a previous descriptor and continues to the data indicated by the next descriptor. | SW | HW |
| FEND | 6 | Frame End The descriptor points to valid data for a frame. The frame continues from the previous descriptor and ends with the data indicated by in this descriptor. | SW | HW |
| FSINGLE | 7 | Frame Single The descriptor points to valid data for a complete frame. | SW | HW |
| Chain control | | | | |
| LINK | 8 | Link Defines the next descriptor in the chain. | HW | HW |
| LINKFIX | 9 | Fixed Link Same as LINK, but not changed by AVB-DMAC after processing. | SW | SW |
| EOS | 10 | End Of Set Control element to split a descriptor chain. The chain stops and waits for user interaction. | HW | HW |
| HW/SW arbitration | | | | |
| FEMPTY | 12 | Frame Empty A descriptor related to frame data but not containing valid data for a frame | HW | SW |
| FEMPTY_IS | 13 | Frame Empty Incremental Start A descriptor related to frame data but not containing valid data for a frame. DESCR.DPTR sets the base address of an "incremental data area" in the URAM. | HW | Invalid |
| FEMPTY_IC | 14 | Frame Empty Incremental Continue A descriptor related to frame data but not containing valid data for a frame. Data is stored to the incremental data area in the URAM. | HW | Invalid |
| FEMPTY_ND | 15 | Frame Empty No Data storage A descriptor related to frame data but not containing valid data for a frame. The descriptor is processed in the same way as FEMPTY but data are not stored in the URAM. | HW | Invalid |
| LEEMPTY | 2 | Link Empty A link descriptor for processing by the AVB-DMAC | SW | SW |
| EEMPTY | 3 | EOS Empty An EOS descriptor for processing by the AVB-DMAC | SW | SW |
| DT0 | 0 | Reserved | Invalid | Invalid |
| DT1 | 1 | Reserved | Invalid | Invalid |
| DT11 | 11 | Reserved | Invalid | Invalid |

(7) Layout of General Descriptors in the URAM

The AVB-DMAC updates processed descriptors in the URAM. The field to be changed in the descriptor being updated depends upon whether the direction is transmission or reception and the queue mode. Other fields will not be changed. There are no restrictions on the values set in unused descriptor fields (indicated by “—” in the figure).

(a) Frame Data Descriptors

The allocation of bits in the frame data descriptors (FSTART, FMID, FEND, and FSINGLE) is shown below.

- Normal descriptor (usable in both reception and transmission)

- Extended descriptor (usable only in reception)

Table 46.8 Contents of Frame Data Descriptors (DESCR)

| Bit Name | Function |
|------------|---|
| DT[3:0] | Descriptor Type 5: FSTART 4: FMID 6: FEND 7: FSINGLE For details, see section 46.3.4 (2), Setting Up Reception Descriptors, and section 46.3.5 (2), Setting Up Transmission Descriptors. |
| DIE[3:0] | Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFI). |
| — | Content Control For details, see section 46.3.4 (2), Setting Up Reception Descriptors, and section 46.3.5 (2), Setting Up Transmission Descriptors. |
| DS[11:0] | Data Size Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer Pointer to the data area for the descriptor |
| TS[79:0] | Time Stamp Time stamp of the received frame (only available in extended descriptors) |

Note: Some bits in extended descriptors are reserved (The reserved bits (above DESCR.TS[79:64]) in an extended descriptor are set to H'0000 after the time stamp is stored).

(b) Hardware/Software Arbitration Descriptors (Only for Reception)

The allocation of bits in the descriptors for hardware/software arbitration (FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND) is shown below.

The allocation of bits in the arbitration descriptors for use in reception is the same as in frame data descriptors.

- Normal descriptor

- Extended descriptor (usable only in reception)

Table 46.9 Contents of Hardware/Software Arbitration Descriptors (DESCR)

| Bit Name | Function |
|------------|---|
| DT[3:0] | Descriptor Type 12: FEMPTY 13: FEMPTY_IS 14: FEMPTY_IC 15: FEMPTY_ND For details, see Table 46.7, Summary of Descriptor Types. |
| DIE[3:0] | Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFI). |
| — | Content Control For details, see section 46.3.4 (2), Setting Up Reception Descriptors, and section 46.3.5 (2), Setting Up Transmission Descriptors. |
| DS[11:0] | Data Size Size of the data area/frame data for the descriptor (in bytes) |
| DPTR[31:0] | Descriptor Pointer Pointer to the data area for the descriptor |
| TS[79:0] | Time Stamp Time stamp of the received frame (only available in extended descriptors) |

Note: When the descriptor is an extended descriptor, it has a 12-byte unused area.

In an FEMPTY descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), data size (DS), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IS descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and descriptor pointer (DPTR) fields are used.

In an FEMPTY_IC descriptor, the descriptor type (DT) and descriptor interrupt enable (DIE) are used.

In an FEMPTY_ND descriptor, the descriptor type (DT), descriptor interrupt enable (DIE), and data size (DS) are used.

(c) Link Descriptors

The allocation of bits in the link descriptors (LINK and LINKFIX) is shown below.

- Normal descriptor

Table 46.10 Contents of Link Descriptors (DESCR)

| Bit Name | Function |
|------------|---|
| DT[3:0] | Descriptor Type 8: LINK 9: LINKFIX For details, see Table 46.7, Summary of Descriptor Types. |
| DIE[3:0] | Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFI). |
| DPTR[31:0] | Descriptor Pointer Pointer to the data area for the descriptor Register an address on a 32-bit boundary. |

Note: Register an address aligned with a 32-bit boundary as the descriptor pointer (DESCR.DPTR).

(d) Other Descriptors

The allocation of bits in the other descriptors (EOS, FEMPTY (only for transmission), LEMPTY, and EEMPTY) is shown below.

Table 46.11 Contents of Other Descriptors (DESCR)

| Bit Name | Function |
|----------|---|
| DT[3:0] | Descriptor Type 10: EOS 12: FEMPTY (only for transmission) 2: LEMPTY 3: EEMPTY For details, see Table 46.7, Summary of Descriptor Types. |
| DIE[3:0] | Descriptor Interrupt Enable B'0000: Descriptor interrupt is disabled. B'0001 to B'1111: The corresponding descriptor interrupt is generated (DIS.DPFI). |

(8) How to Use Frame Data Descriptors

The descriptor data area size field (DESCR.DS) can specify up to 2048 bytes of Ethernet frame data per data area. Settings higher than 2048 (bytes) cannot be made.

In general, Ethernet frames are not of uniform length. The AVB-DMAC is capable of dividing frame data into multiple descriptors in order to minimize the memory capacity for frame data. This function allows processing of frames that are longer than the limit for descriptor data areas. Division can also be applied to frames on the basis of their data structures.

To handle frames and descriptors, four descriptor types (DESCR.DT) as FSTART, FEND, FMID and FSINGLE are defined.

Figure 46.14 shows the mapping of frame data by frame data descriptors. The descriptor data areas are allocated to the URAM. For frames that require division into four or more data areas, additional FMID descriptors can be added as required.

Figure 46.14 Mapping of Frame Data

For reception, set the descriptor data areas to the maximum size (i.e. give DESCR.DS its maximum value). The AVB-DMAC will store received frame data in the given area. If a received frame has more data than the maximum size, the AVB-DMAC will divide the data up.

For transmission, set the descriptor data area size field to the actual data size. The AVB-DMAC modifies the descriptor type (DESCR.DT) to FEMPTY after processing the relevant descriptor. The data size (DESCR.DS) and descriptor pointer (DESCR.PTR) fields retain their settings.

A descriptor data area including unused space produces an empty space between data areas. In reception, an “incremental data area” can be used to prevent empty spaces. For incremental data areas, see section 46.3.4(3)(b) Incremental Data Areas.

As well as reducing the memory capacity taken up by the descriptor area in the URAM, division into frames can be used to identify different sections of data (e.g. for separating a header and data).

(9) How to Use Chain Control Descriptors

Link Descriptors

The link descriptors can be used to set up cyclic descriptor chains (for details, see section 46.3.3(2) Using Descriptor Chains in Queues)

After a LINK descriptor is processed, its descriptor type (DESCR.DT) is changed to LEMPTY. The descriptor pointer (DESCR.PTR) retains its setting.

After processing of a LINKFIX descriptor, the descriptor type (DESCR.DT) is not updated. Software can change the descriptor type (DESCR.DT), descriptor interrupt enable (DESCR.DIE), and descriptor pointer (DESCR.DPTR). However, DESCR.DT should not be modified by software. Take care to check the current descriptor address register (CDARq.CDA) before changing the descriptor pointer (DESCR.DPTR).

EOS Descriptor

Use the EOS descriptor to divide a descriptor chain into various segments. The queue can continue even after an EOS descriptor.

In transmission, the response to an EOS descriptor is clearing of the transmit start request bit in the transmit configuration control register (TCCR.TSRQq) to 0.

In reception, the response is generation of a receive queue full interrupt (RIS2.QFFr), although if the frame currently being received is being divided for storage (received data such as those where some storage is in FMID- or FEND-type frames), the data are not completely stored.

(10) How to Use Hardware and Software Arbitration Descriptors

In hardware processing of descriptors, the empty descriptor types (FEMPTY, LEMPTY, and EEMPTY) are used to distinguish various descriptors. For software, they can be used to initiate checking for empty spaces, etc.

FEMPTY, FEMPTY_IS, FEMPTY_IC, and FEMPTY_ND

These descriptor types (DESCR.DT) are used for descriptors that do not contain effective data. Of these, only FEMPTY is used in transmission. The descriptor pointer of a FEMPTYxxx descriptor refers to a descriptor data area.

LEEMPTY

This descriptor type (DESCR.DT) is assigned to LINK descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an LEMPTY descriptor still points to the linked descriptor.

EEMPTY

This descriptor type (DESCR.DT) is assigned to EOS descriptors after they have been processed. The descriptor pointer (DESCR.DPTR) of an EEMPTY descriptor is not used.

(11) Synchronization between Descriptor Access by Hardware and Software

The allocation of descriptor types (DESCR.DT) to the URAM can be used to set up the primary synchronization between hardware and software. By this, the number of CPU accesses to registers of EthernetAVB-IF can be minimized and performance can be increased.

Basic concepts of synchronization:

- Each descriptor type in the set is exclusively for processing by hardware or software, depending on the direction of transfer (see Table 46.7 Summary of Descriptor Types).
- Software must not change a descriptor assigned to hardware processing (the hardware does not change descriptors assigned to software processing).

In the case of software processing, the software must process the information in the descriptor and the corresponding frame data before changing the descriptor type. If a descriptor type for hardware is set in DESCR.DT, the software should not change any part of the descriptor or of the corresponding frame data.

(12) Tips for Optimizing Performance in Handling Descriptors

The following items are recommended as ways to ensure the optimal use of data structures in the URAM.

They are not requirements, but using a different approach may increase the load on the system bus within the LSI chip.

- Register descriptors with 64-bit alignment (this does not apply to extended descriptors).
- While in operation mode, use LINKFIX instead of LINK whenever a descriptor need not be changed. Hardware modifies the descriptor type (DESCR.DT) fields of LINK descriptors.
- Frame data is accessed in blocks up to 128 bytes.
- The number of 128 byte borders (addresses H'x_xx00 and H'x_xx80) and frame data inside should be minimized.
- Design the descriptor chains in ways that minimize parallelism of processing. This helps in dividing the chains into segments allocated to different cache pages, and in arranging the different segments exclusively for access by software or hardware.
- Minimize the number of divided frames. This can reduce the overhead of descriptor handling.

46.3.4 Control in Reception

The point of the AVB-DMAC is to transfer data between the E-MAC and URAM without intervention by the CPU.

AVB-DMAC needs descriptors that define the amounts of frame data to be stored and the locations. After the E-MAC receives a frame, it stores the received frame data and the conditions of reception as the E-MAC state. If the descriptor is extended, the time stamp is also stored. For a description of how to set up descriptors for use in reception, see section 46.3.4(2) Setting Up Reception Descriptors.

The AVB-DMAC filters received frames to separate them into various classifications (separation filtering). More specifically, this is done to separate received frames into the various reception queues and to set the priorities of different classes of received frames. For more on separation filtering, see section 46.3.4(1)(a) Separation Filtering.

Figure 46.15 shows the reception data bus and the selection of queues for use in reception.

Each frame received from the E-MAC is stored in the reception FIFO; in parallel with this, the frame is analyzed to identify its type and the target queue number. After the E-MAC completes reception, the target queue number is generated and stored in the reception FIFO. Appending of a reception flag depends on the storage of one frame among the reception queues in the URAM, and the unread frame counter (UFC) is also associated with frame storage.

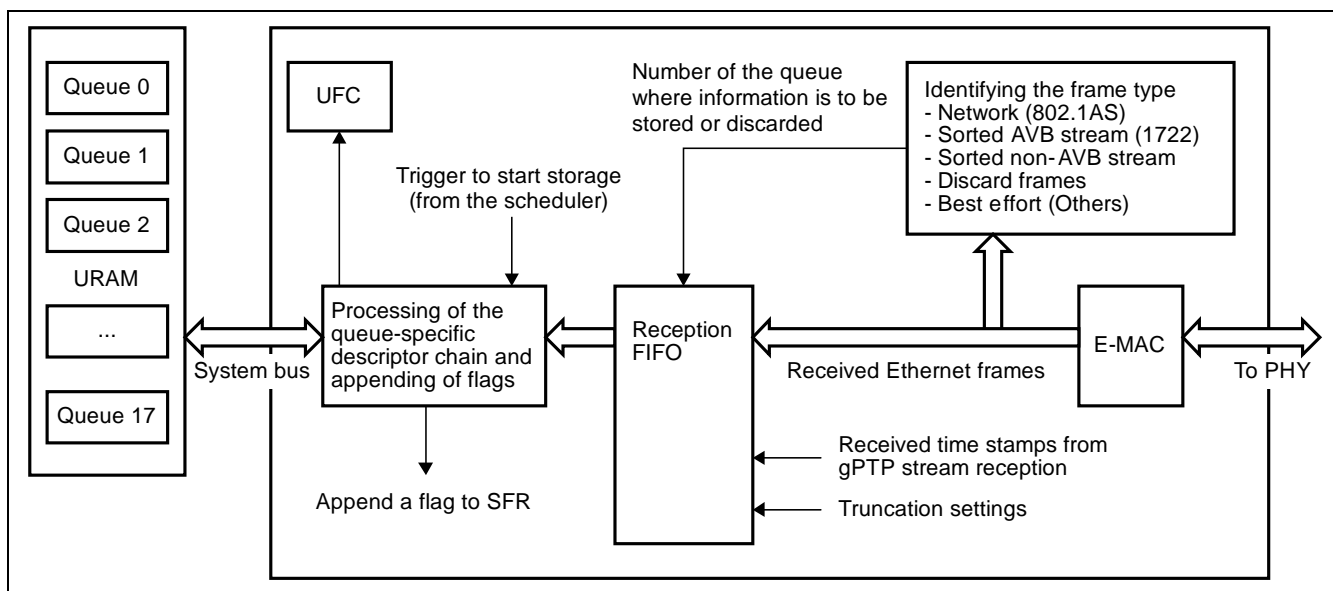

Figure 46.15 Mechanism of General Reception Queue Selection

(1) Reception Queues

The AVB-DMAC applies its separation filtering mechanism to select the reception queue for storing a received frame. The AVB-DMAC stores all received frames in the URAM.

There are two conditions for the AVB-DMAC to discard a received frame.

- Detection of an error during reception by the E-MAC
 - Whether error frames are discarded or stored in reception queue 0 (best effort) depends on the setting of the error frame enable bit in the receive configuration register (RCR.EFFS). If error frames are to be stored (RCR.EFFS = 1), they are always stored in queue 0 (best effort). In this case, characteristics specific to the queue (e.g. truncation) will vary. If the storage of time stamps for reception queue 0 (best effort) is enabled (the time stamp enable bit in the receive configuration register RCR.ETS0 = 1), time stamps are stored even for error frames.
- Frame fails the separation filter
 - It depends on RCR.ESF if such frame is discarded or stored in receive queue 0 (best effort).

The flowchart in Figure 46.16 shows how the AVB-DMAC selects the reception queue in accord with the frame type, including judgment by the separation filter. Selection of the queue starts when the E-MAC completes frame reception. The result is storage of the frame in the proper queue or the frame being discarded.

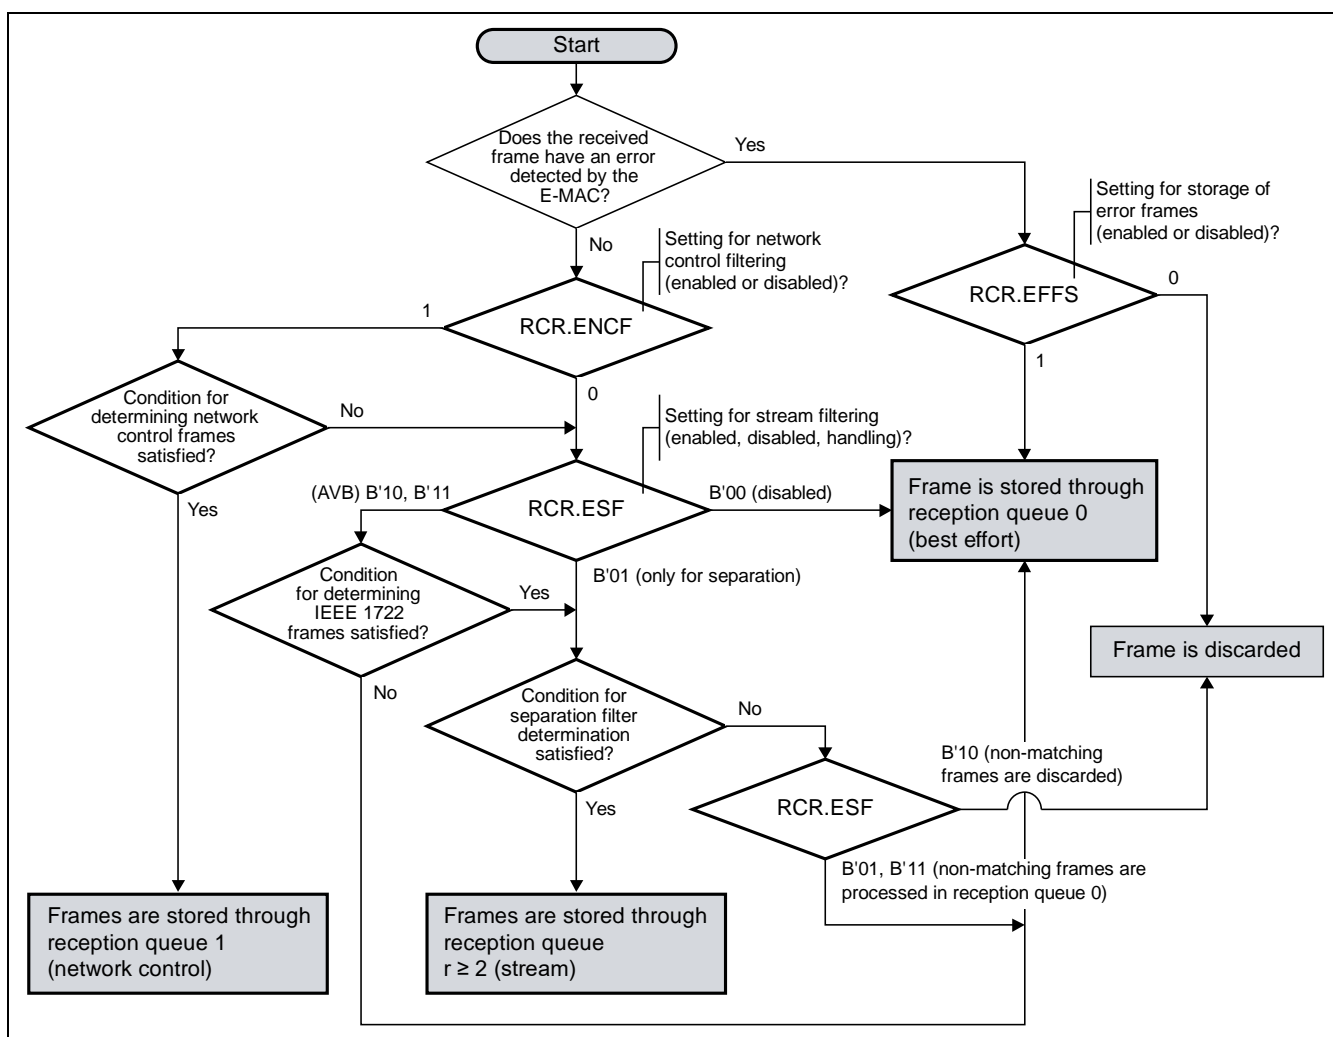

Figure 46.16 Mechanism of Reception Queue Selection

Notes on the meanings of entries in the flowchart

- “Condition for determining network control frames”
 The Ethernet destination address (DA) is 01:80:C2:00:00:0E.
 The Ethernet type (ET) is 88:F7.
- “Condition for determining IEEE 1722 frames”
 The Ethernet destination address (DA) is within the range from 91:E0:F0:00:00:00 to 91:E0:F0:00:FE:FF.
 The VLAN tagged TPID (tag protocol identifier) field (VL) is 81:00.
 The Ethernet type (ET) is 22:F0.
- “Condition for separation filter determination”
 See section 46.3.4(1)(a) Separation Filtering.

Figure 46.17 shows the allocation of bits related to the network and stream types in Ethernet frames. The preambles of Ethernet frames are not taken into account.

| Data bytes | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 | 19 |
|--------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| Network type | DA1 | DA2 | DA3 | DA4 | DA5 | DA6 | SA1 | SA2 | SA3 | SA4 | SA5 | SA6 | ET1 | ET2 | ... | ... | ... | ... | ... | ... |
| Stream type | DA1 | DA2 | DA3 | DA4 | DA5 | DA6 | SA1 | SA2 | SA3 | SA4 | SA5 | SA6 | VL1 | VL2 | - | - | ET1 | ET2 | ... | ... |

Figure 46.17 Data Bytes of Ethernet Frames Used in Classification

(a) Separation Filtering

Separation filtering involves the checking of up to 64 bits (eight successive bytes) in received Ethernet frames. The setting for the first byte (i.e. the setting of the separation filter offset configuration register (SFO.FBP)), selects the part of frames to be used in separation filtering. There is also a common filter mask (set in the separation filter mask configuration register (SFMi.CFM)) that can be freely set to reduce the number of bytes used in separation filtering or to mask particular bits.

Examples

To use one byte in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'0000_00FF and separation filter mask configuration register 1 (SFM1.CFM) to H'0000_0000.

To use seven bytes in separation, set separation filter mask configuration register 0 (SFM0.CFM) to H'FFFF_FFFF and separation filter mask configuration register 1 (SFM1.CFM) to H'00FF_FFFF.

Note: If bits at some positions are set to 0 in the separation mask, in order to match with the pattern, the bits at the corresponding positions of the pattern must also be set to 0. Only those bits in which the separation filter pattern configuration register (SFPi.FPs) setting is equal to the separation filter mask configuration register (SFMi.CFM) are sorted by matching with received data.

Figure 46.18 shows separation filtering. The selected data from a received frame (Rx_Frame[63:0]) are masked by the common filter mask. As a result, the selected frame data can be obtained. This value is compared with all filter patterns. The separation filter circuit in the AVB-DMAC selects the filter pattern that matches the queue having the lowest index s or selects a flag to indicate that there is no matching separation pattern.

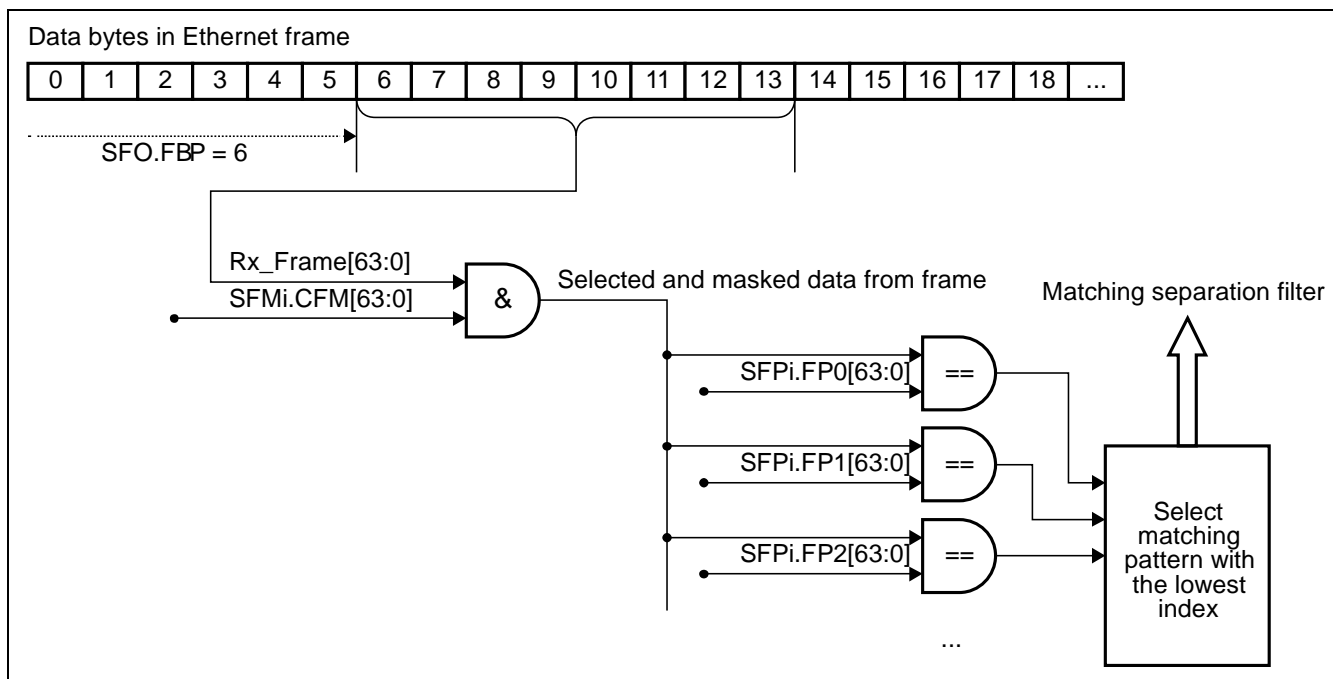

Figure 46.18 Separation Filtering

(b) Separating Streams

The AVB-DMAC applies separation filtering to sort frames received in streams. An AVB network has a concept of “Talker” and “Listener”. A Talker is an end station that generates one or more streams. A Listener is an end station that has the role of being a sink for at least one stream. The various A/V streams are identified by 8-byte stream IDs.

The number of end stations within an AVB network and their roles differ with the application.

The stream ID is a general pattern of the AVB network for identifying one stream. Figure 46.19 shows the bit allocation of bits in IEEE1722 Ethernet frames and stream ID fields.

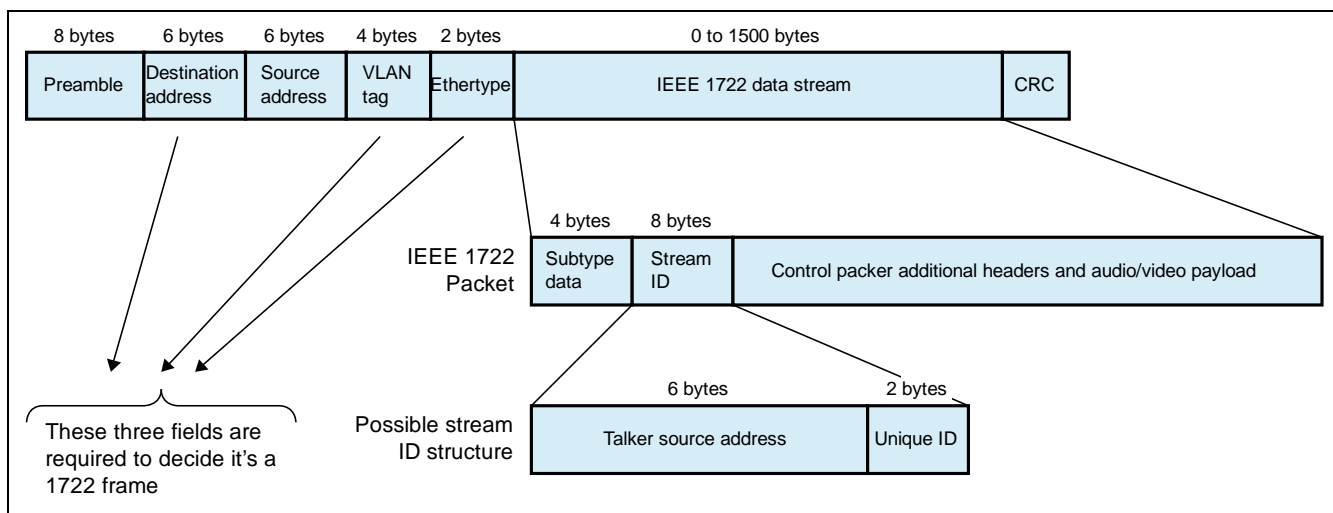

Figure 46.19 IEEE 1722 Frame Layout and Stream ID

The IEEE 1722 standard stipulates that the stream ID field starts from the 23rd byte (not counting the preamble). Accordingly, set the separation filter offset (SFO.FBP) to 22 in operations on IEEE 1722 streams. Set the separation filter mask (SFMi) and separation filter pattern (SFPi) in accord with the specification of the product in which the chip is being used.

Example: In the example of a stream ID shown in Figure 46.19, the current application divides the field into the talker source address and the unique stream ID. The unique ID is used to differentiate between multiple streams from the same talker. Based on this, there are two settings for separation filter masking:

- To divide various streams into individual queues, set SFM0.CFM to H'FFFF_FFFF and SFM1.CFM to H'FFFF_FFFF.
- To divide streams from various talkers into individual queues, set SFM0.CFM to H'FFFF_FFFF and SFM1.CFM to H'0000_FFFF. This excludes the unique ID from the filter condition.

(c) Reconfiguration of separation filter during OPERATION

In CONFIG mode the initial separation filter configuration is defined. To prevent inconsistent filter results during OPERATION direct parameter change is not possible; instead update mechanism by SFVi.LV and SFL.LC should be used.

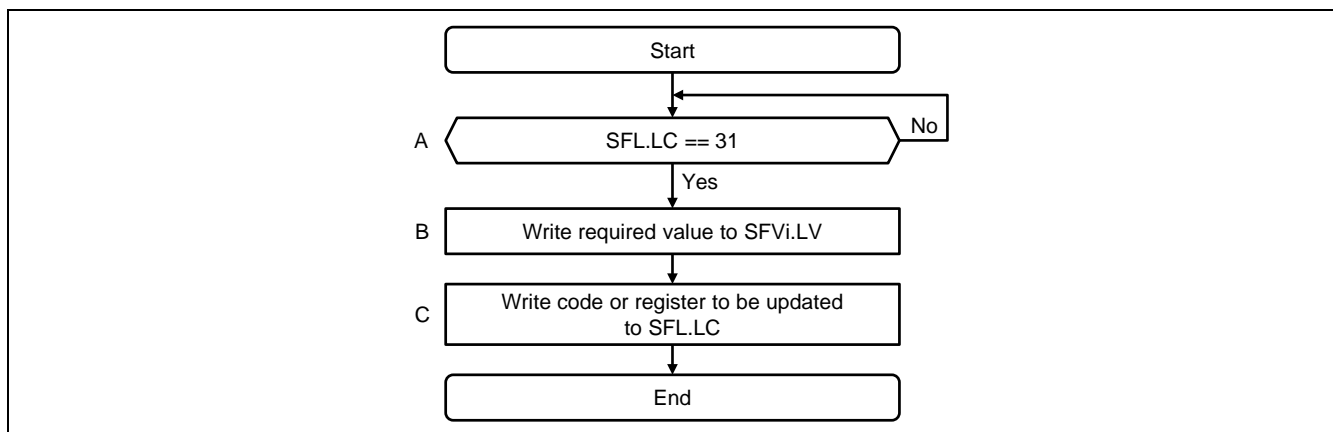

Figure 46.20 SW flow to update separation filter during OPERATION

When reconfigure separation filter, EthernetAVB-IF guarantees consistent classification for one received frame. If reconfiguration requires a sequence of parameter changes, CPU has to order reconfiguration based on application demand.

EthernetAVB-IF updates filter configurations when no frame reception is handled. In worse case the update is delayed by one frame reception. Exact duration depends on PHY speed and frame size. By reading SFL.LC CPU can observe when a previous update has been processed.

Note: Frame classification happens during frame reception and storage into internal Rx-FIFO. There may be frames with old classification pending in Rx-FIFO or under storage to URAM when filter reconfiguration is accepted.

(2) Setting Up Reception Descriptors

For reception, the descriptor mechanism is essentially as described in section 46.3.3 Descriptors.

This section describes memory operations that are especially required in handling reception queues.

(a) Reception Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 46.12 shows the descriptor types used in reception.

Table 46.12 Descriptor Types in Reception

| Descriptor Type (DESCR.DT) | Operation | Write-back |
|--|--|--------------------------------|
| Frame Start (FSTART) | Condition for data not being stored in a reception queue: The RIS2.QFFr bit indicates that queue r is full and the received frame is not stored. Descriptor processing proceeds again in response to further reception. | Not changed |
| Frame Middle (FMID) | Same as FSTART | Not changed |
| Frame End (FEND) | Same as FSTART | Not changed |
| Frame Single (FSINGLE) | Same as FSTART | Not changed |
| Link (LINK) | Processing proceeds to the descriptor specified by DESCR.DPTR. | LEMPY |
| Fixed Link (LINKFIX) | Same as LINK | Not changed |
| End Of Set (EOS) | A stop point defined by software has been reached. A descriptor of this type within a divided frame (writing of FMID or FEND) stops the frame being stored and the frame is lost. RIS2.QFFr indicates that the frame has been lost. If this happens at the start of a frame (writing of FSTART or FSINGLE), storing of frames starts from the next descriptor. In either case, processing shifts to the next descriptor in the chain. | EEMPTY |
| Frame Empty (FEMPTY) | The descriptor can be used to store received data. Up to DESCR.DS bytes are stored in the descriptor data area. For details, see section 46.3.4(3)(a) Storing Frame Data in the Descriptor Data Area. | FSTART, FMID, FEND, or FSINGLE |
| Frame Empty Incremental Start (FEMPTY_IS) | The descriptor can be used to store received data. All data for the frame are stored in the descriptor data area. DESCR.DPTR indicates the base address of the incremental data area. For details, see section 46.3.4(3)(b) Incremental Data Areas. | FEND or FSINGLE |
| Frame Empty Incremental Continue (FEMPTY_IC) | The descriptor can be used to store received data. The remaining bytes of frame data are stored in the descriptor data area. DESCR.DPTR is undefined, but is written back at the start position within the incremental data area after processing. For details, see section 46.3.4(3)(b) Incremental Data Areas. | FEND or FSINGLE |
| Frame Empty No Data storage (FEMPTY_ND) | The descriptor can be used to store received data. Up to DESCR.DS bytes are captured from the reception FIFO but not stored. After processing, DESCR.DS is written back as 0. For details, see section 46.3.4(3)(b) Incremental Data Areas. | FSTART, FMID, FEND or FSINGLE |
| Link Empty (LEMPY) | Same as FSTART | Not changed |
| EOS Empty (EEMPTY) | Same as FSTART | Not changed |

(b) Configuration of Reception Frame Data Descriptors

Figure 46.21 shows the configuration of descriptors for use with reception queues. The reception-specific fields are the same whether the descriptor is normal or extended. The reception-specific fields (DESCR.MSC, DESCR.PS, DESCR.EI, and DESCR.TI) are described in Table 46.13.

For the other fields and the descriptor types, see section 46.3.3(6) Descriptor Type.

Figure 46.21 Configuration of Descriptor for a Received Frame

Table 46.13 Configuration of a Received Descriptor

| Bit Name | Function |
|----------|--|
| MSC | <p>E-MAC Status Code</p> <p>These bits indicate errors in reception detected by the E-MAC.</p> <p>In the case of a divided frame, these bits are set to the same value within all descriptors for the frame data. Details of the bits are as follows.</p> <p>MSC[7]: Received frame has a multicast address.</p> <p>MSC[6]: Carrier extend error</p> <p>MSC[5]: Carrier sense error</p> <p>MSC[4]: Received frame has alignment error.</p> <p>MSC[3]: Received frame is too long.</p> <p>MSC[2]: Received frame is too short</p> <p>MSC[1]: Error in frame reception (PHY detects an error)</p> <p>MSC[0]: Received frame has a CRC error.</p> |
| PS | <p>Padding Selection</p> <p>These bits specify whether frame data are to be padded when stored in the incremental data area.</p> <p>Insertion of padding data is in accord with the settings in the RPC register.</p> <p>0: Padding is not to be inserted.</p> <p>1: Padding data may be inserted. This depends on the RPC settings.</p> |
| EI | <p>Error Indication</p> <p>This bit indicates the detection of an error in frame data while a frame was being stored.</p> <p>The bit is set to 1 for a descriptor in which an error has been detected. If the descriptor is for a divided frame, storage of the frame is aborted.</p> <p>0: No error</p> <p>1: Error is detected</p> |
| TI | <p>Truncation Indication</p> <p>This bit indicates whether frame data received from the E-MAC have been truncated before being stored.</p> <p>These bits are set to the same value within all frame data descriptors for a divided frame.</p> <p>0: Data have not been truncated.</p> <p>1: Data have been truncated.</p> |

Note: The RCR.EFFS bit specifies whether or not frames with errors detected by the E-MAC are to be stored in the URAM. When the storing of error frames is disabled, error codes are not written to DESCR.MSC.

(3) Reception Processing

After initialization, the AVB-DMAC is able to select the proper reception queue and store received frames in the data area in the URAM as indicated by the descriptor. The AVB-DMAC continues to store received data in the URAM as long as space is available for descriptors and data areas.

Received frames are classified and stored in the reception FIFO in accord with the algorithm described in section 46.3.4(1)(a) Separation Filtering.

If the reception FIFO contains even one frame, storing is executed to the reception queue.

If there is even one empty data descriptor in a queue for which reception has started, the storage of frame data starts. Received frames for a queue that is already full (there is no empty frame descriptor or the UFC stop level has been reached) are discarded from the reception FIFO. This ensures that one queue being full does not prevent the storage of data in the other queues.

(a) Storing Frame Data in the Descriptor Data Area

Frame data for storage are assumed to be in either of the two patterns described below.

- The data for an entire frame will fit in the descriptor data area.
 - In this case, the descriptor type (DESCR.DT) is FSINGLE.
- Frame data to be stored in the descriptor data area arrive in divided form.
 - In this case, FSTART is written to the descriptor type (DESCR.DT) bits of the first descriptor of the frame data to arrive and FMID and FEND are written to the type bits of descriptors for subsequent data.

The descriptor type is updated by the AVB-DMAC in the last step of descriptor processing, so software can always access the descriptor assigned to DESCR.DT.

When normal synchronization mode is used, the CPU can write FEMPTYxxx directly to the descriptor type field after processing the stored element. Do not change the descriptor or any part of the descriptor data area after FEMPTYxxx is written to DESCR.DT.

Storing Frame Data for a Whole Single Frame

For a frame with an FSINGLE descriptor, all data for the frame are held at the position defined by DESCR.DPTR. DESCR.DS indicates the length of the received frame.

If DESCR.DS is bigger than the actual size of a received frame, the FSINGLE descriptor is stored in place of the FEMPTY or FEMPTY_ND descriptor after processing.

Also, the FSINGLE descriptor is stored in place of the FEMPTY_IS or FEMPTY_IC descriptor, which always hold the descriptor data area greater than all frame data in Rx-FIFO after processing.

Storing Frame Data as Divided Frames

Divided frames are handled in the same way as a single frame. A frame stored with divided descriptors must be recombined before use. DESCR.EI and DESCR.TS are only valid in the last descriptor of the sequence for a divided frame.

Note: If the data area size setting in DESCR.DS is not a multiple of four, the number of bytes set in DESCR.DS is fetched from the reception FIFO and the remaining bytes are used as the next storage area.

After a received frame is divided into different descriptors, each storage element is handled separately, and the descriptor type is assigned by software after processing. Accordingly, an error frame (FEMPTYxxx instead of FMID or FEND) may exist while a descriptor chain is being processed. In such a case, the CPU must postpone processing of the error frame to the next trigger point.

No Data are Stored

The application specification may lead to some types of received frames being unimportant (for example, when the application only requires stream data from the Ethernet frames). Storing frames in divided form makes separating out the unnecessary parts of Ethernet frames possible.

If part of a divided frame is not required, use the FEMPTY_ND descriptor for that part so that it is not stored in the URAM. Not storing the data negates the need for bandwidth on the data bus, improving the overall performance.

When an FEMPTY_ND descriptor is processed, DESCR.DS is set to 0. This brings the frame data section of the descriptor into agreement with the FEMPTY type. DESCR.DS = 0 is for the unique identification of the descriptor after writing.

(b) Incremental Data Areas

Secure space in the URAM for storing received data. Even when data are placed in the URAM area such that all descriptor data areas of a chain are contiguous, a received frame being shorter than the descriptor data area will lead to an empty space. Figure 46.22 shows an example of settings and the memory map.

Certain applications require that data areas be contiguous (e.g. when received data are to be processed other than by hardware as the A/V codec module). When the length of received frames differs (e.g. when payloads vary between having one or two A/V packages), the use of a static pointer in the descriptor produces empty spaces in the data area. This may necessitate direct additional processing to remove the empty spaces.

Accordingly, and to reduce the CPU load imposed by copying data, the AVB-DMAC supports an “incremental data area” function.

When incremental data areas are in use, all descriptors use a common data area for storage. One descriptor (FEMPTY_IS) defines the base address of the incremental data area and the next descriptor (FEMPTY_IC) within the descriptor chain holds received data. Figure 46.23 shows an example of settings and the memory map.

Use of an incremental data area does not reduce the memory space in the individual descriptor data areas.

The hardware and software synchronization strategy and performance are also not changed.

It is also possible to divide a frame up among various descriptors in a way that reflects its structure (e.g. one descriptor for the Ethernet header and one for the data payload).

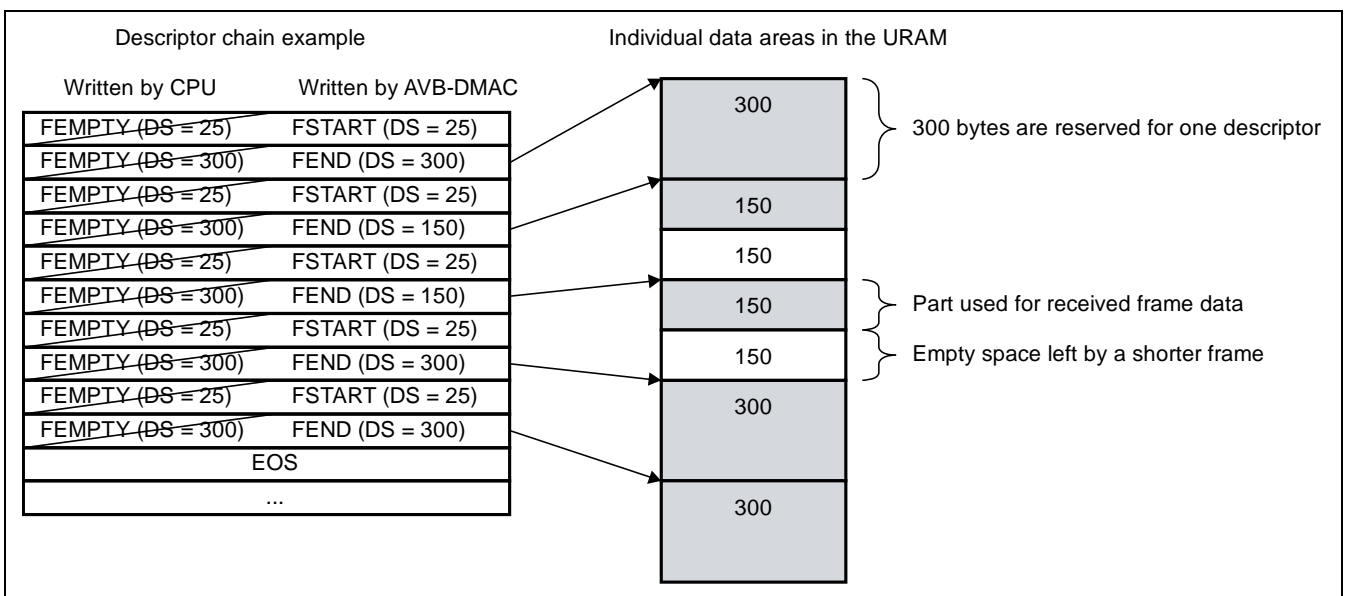

Figure 46.22 A Reception Queue Using Individual Descriptor Data Areas

Figure 46.22 and Figure 46.23 show how control of the data storage areas by a descriptor chain varies according to whether individual or incremental data areas are in use. The chains are configured for storing received frames consisting of a 25-byte header (which is treated as one descriptor; and is outside the scope) and a 150- or 300-byte payload (whether one or two 150-byte payload packages are transmitted with one Ethernet frame depends on the data source).

In Figure 46.22, the EOS descriptor is added as an example of a re-synchronization point. If the frame source transmits a frame containing more than 325 bytes, the frame will be divided among three descriptors, meaning that synchronization of the header and data sequences is lost. Despite this, however, the frame is not divided across the EOS descriptor, so recovery is automatic without software interaction. The EOS is not required with the incremental descriptors because all data being processed are always stored while an incremental data area is in use.

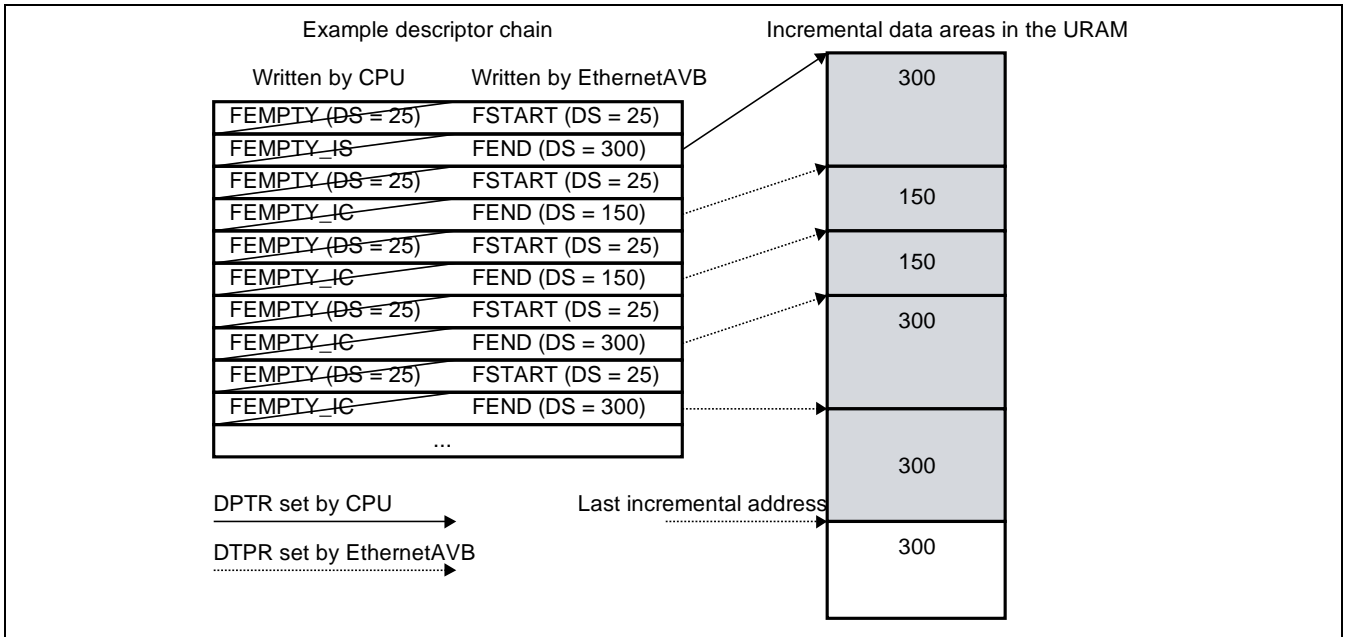

Figure 46.23 Reception Queue Using a Common Incremental Data Area

As Figure 46.23 shows, when data are stored in an incremental data area, the descriptor pointers in the FEMPTY_IC descriptors (DESCR.DPTR) are updated. Accordingly, the resulting FEND or FSINGLE descriptor is in the same format as after writing to an FEMPTY descriptor.

Software captures received data from an incremental data area, which has no empty storage areas between frame data. The only empty space is that at the end of the incremental data area. The sizes of incremental data areas and of blocks of data for storage in incremental data areas must be multiples of four bytes. When the amount of data for storage in an incremental data area is not a multiple of four bytes, from one to three bytes of empty space will be produced. DESCR.DS can be read to check for such empty spaces.

CPU cannot restrict directly the amount of received data stored by an incremental descriptor (FEMPTY_IS, FEMPTY_IC) as this is possible for other descriptors (FEMPTY, FEMPTY_ND) by DESCR.DS. Incremental descriptors store always all received data.

Setting Up an Incremental Data Area

A descriptor chain in the incremental data area having N descriptors (one FEMPTY_IS and N-1 FEMPTY_IC) means that the incremental storage area of N times of maximum frame size is needed.

As Figure 46.23 shows, DESCR.DPTR of an FEMPTY_IS descriptor indicates the base address of the incremental data area. The next FEMPTY_IS descriptor in the chain indicates the processing step where data must be stored in the incremental data area.

Processing an Incremental Data Area Based on Descriptors

Since data processing by the CPU is the same regardless of how the AVB-DMAC stores the data, data stored in an incremental data area do not require any special handling.

Padding

Use padding for received frame data that are not aligned correctly in the specified memory structure. Padding can be set individually for each descriptor. Accordingly, in the reception of divided frames, padding can be restricted to only those frames that require it (e.g. A/V payload data.)

Padding can also be used to optimize system performance in an incremental data area (e.g. to prevent inefficient access by aligning received data with 32-byte boundaries in the incremental data area), as well as to fulfill application-specific requirements for specified memory structures (e.g. formats required by other modules that will be processing the received data).

Padding can only be used in an incremental data area.

The value H'0000_0000 is always used in padding.

Padding is the addition of the number of words (from one to seven 32-bit words) set in the stored padding counter in the receive padding configuration register (RPC.PCNT). This padding is repeatedly inserted in accord with the value in the stored data counter (RPC.DCNT) (from one to 255 32-bit words). When the stored data counter (RPC.DCNT) reaches 0, however, padding is not repeated.

The first word of padding is always inserted at the position specified by DESCR.DPTR. When divided frames are in use, a padding word can be inserted at any byte position, and padding is handled on a 32-bit basis (e.g. an incremental data area where the first descriptor is for a 42-byte header data and the second descriptor holds padded payload data).

The next figure shows a general example of how padding is inserted and an example of setting up padding. A indicates frame data A received by the E-MAC, and B indicates the frame data stored in the descriptor data area (32-bit word units).

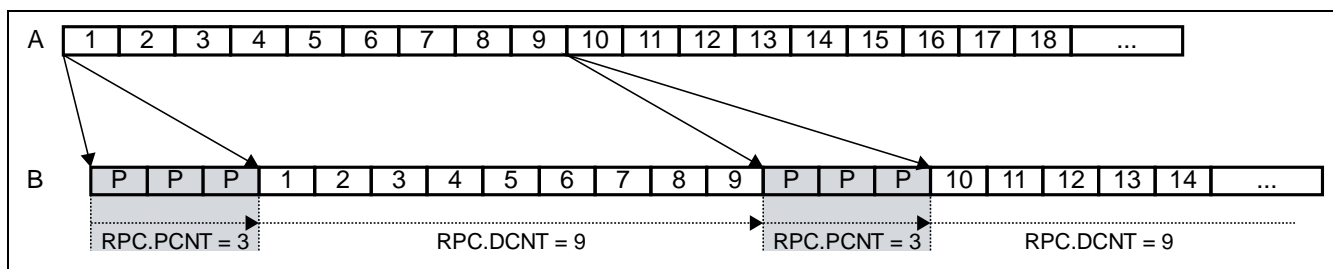

Figure 46.24 Example of a Padding Setting

Both padding and received frame data are counted in the descriptor size (DESCR.DS).

(c) Mode with Write-Back

Constructing a descriptor chain requires software (see Figure 46.25).

In the example in the figure, the variable SWdescr (software descriptor pointer) is a structure to identify a descriptor being processed. SWdescr must be initialized after operation mode is entered and a descriptor base address load request (DLR.LBAq) is executed (condition for starting the flow of software operations).

The frame_processing() function processes the stored data. The function can use SWdescr.DT to check whether processing of a frame is completed. How frame data are processed differs with the application, so create functions that handle processing in accord with the specification.

The processing section is common to all modes of reception. The number of frames processed in response to each trigger can be restricted. When multiple frames have to be processed in a batch, waiting for individual trigger boxes must be skipped for these frames.

Figure 46.25 Flow of Reception Descriptor Processing (with Write-Back)

(d) Support for Reception Time Stamps

Capturing reception time stamps is essential for IEEE 802.1AS time synchronization. Other types of received frames may also require that a reception time stamp be appended; this depends on the application. The AVB-DMAC supports reception time stamps based on the gPTP timer by storing time stamps, which have been captured when Start Frame Delimiter (SFD) of a received frame is arrived, in the last frame data descriptor (FEND or FSINGLE). For the gPTP timer, see section 46.3.7(1) gPTP Timer.

When time stamps are to be stored, use extended descriptors for the entire reception queue. Furthermore, time stamps are always stored for reception queue 1 (network control). Time stamps for reception queue 0 (best effort) and reception queue r (r ≥ 2; for stream data) can be selected by the time stamp enable bits in the receive configuration register (RCR.ETS0 or RCR.ETS2).

(4) Unread Frame Counters

Each reception queue has an unread frame counter (UFCVi). Use the unread frame counter configuration bits in the receive queue configuration register (RQCi.UFCCr) to select from among the four warning and stop levels for each unread frame counter. The 0 setting disables the stop and warning functions. For how to set this up, see Figure 46.26.

Operations of the AVB-DMAC (hardware) and CPU (software) drive an unread frame counter (UFC) in the following ways.

- The hardware indicates that it has added a new frame to the descriptor chain for the queue (this increments the counter).
- Software indicates how many frames from the descriptor chain it has processed by writing to the corresponding bits of the unread frame counter decrement register for the queue (this decrements the register by the number written).

The unread frame counter is based on the number of frames stored in the URAM and is only incremented by one even when a received frame is divided into different descriptors. Failure in storing a descriptor chain requires care because this unread frame counter may fail in synchronization as described in section 46.3.4(4)(a) Unread Frame (UFC) Synchronization Failure.

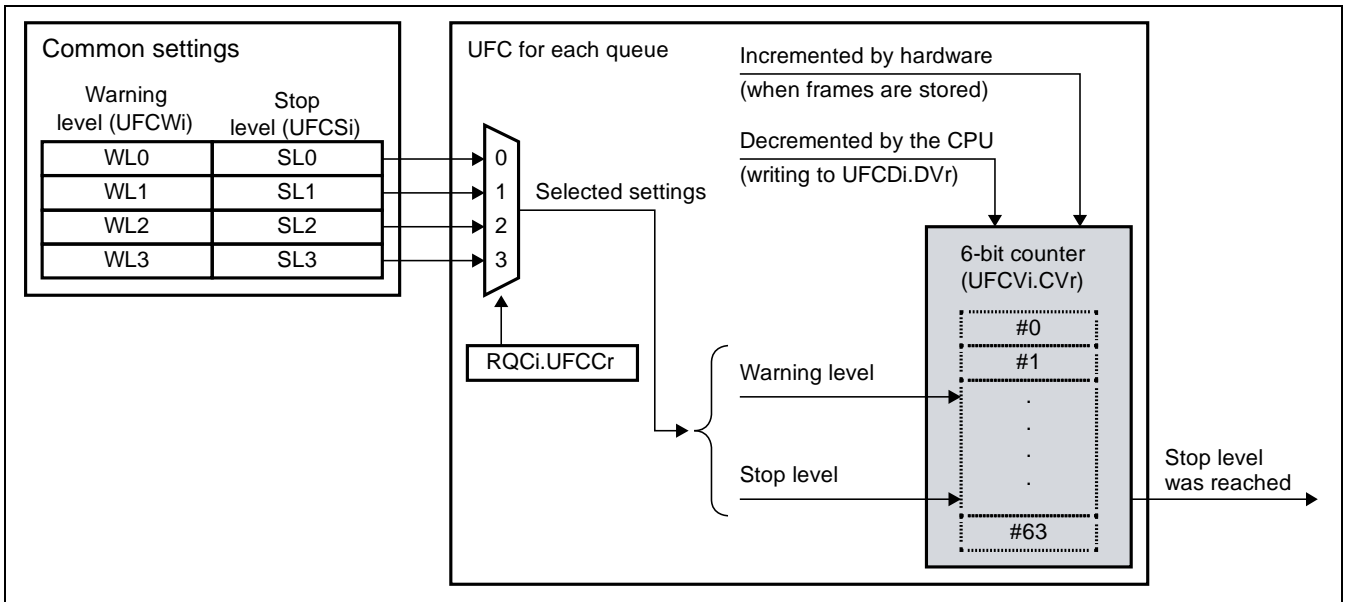

Figure 46.26 Overview of an Unread Frame Counter

Unless synchronization of hardware and software is lost, the current unread frame counter value (UFCVi.CVr) indicates the number of unread frames in the queue.

The indicator that the stop level has been reached prevents the storage of further received frames in the descriptor chain. Selecting 0 as the stop level disables this function. Otherwise, further received frames for the queue are discarded once its unread frame counter reaches the stop level. Activation of the unread frame counter stop function is indicating by setting of the receive queue full interrupt flag in the receive interrupt status register 2 (RIS2.QFFr).

Set the unread frame counter warning level configuration register (UFCW) and the unread frame counter stop level configuration register (UFCS) for each reception queue that will use the unread frame counter function while the current operating mode is configuration mode.

(a) Unread Frame (UFC) Synchronization Failure

The unread frame counters do not recognize failure to store a frame in the URAM. In other words, the AVB-DMAC increments the counter for a queue each time it captures a frame for that queue from the reception FIFO whether or not it succeeds in storing the frame normally in the descriptor chain.

In general, synchronization of hardware and software fails under the following conditions.

- An unread frame counter reaching its maximum value
When the value of a counter in an unread frame counter register i (UFCVi) ($i = 0$ to 4) reaches 63, synchronization for the corresponding queue can fail.
The CPU can only judge that a failure in synchronization has not occurred when the stop level is set to 63.
- A queue not having enough space for a descriptor
In this case, the corresponding receive queue full interrupt flag (RIS2.QFFr) in receive interrupt status register 2 (RIS2) is set.
If an unread frame counter reaches its stop level while synchronization remains normal, the receive queue full interrupt flag (RIS2.QFFr) in the receive interrupt status register 2 (RIS2) is set. Software must respond to this.
- A problem occurring during access to memory

The result of a failure in synchronization is the unread frame counter indicating that the corresponding descriptor chain may contain more available frames than it actually can. To retrieve the correct starting point for operations, use the descriptor base address load request (DLR.LBAq) for the given queue.

46.3.5 Transmission Control

Areas in the URAM for storing transmission descriptors must also be secured (for descriptors, see section 46.3.3 Descriptors).

The AVB-DMAC fetches data from the URAM in accord with the procedure the descriptor describes. The descriptor also retains tag information once the frame has been fetched for transmission. The tag information is used to maintain the relationships between status and time stamps for the software and the AVB-DMAC. The status and time stamp information for transmitted frames remains accessible after their transmission is completed.

(1) Transmission Modes

The AVB-DMAC has two modes of transmission.

- AVB transmission mode
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'01 or B'11.
- Non-AVB transmission mode
This mode is selected by the priority level setting for the transmission queue in the transmit configuration register (setting of the TGC.TQP[1:0] bits) being B'00.

(a) AVB Transmission Mode

AVB transmission supports the control of traffic through the output port to implement various traffic classes.

Support for Traffic Classes and Associated Priority

When transmission is in AVB transmission mode, streams of traffic are transmitted in accord with the part of the AVB specification called Forwarding and Queuing for Time Sensitive Streams (FQTSS; for details on this, see the IEEE 802.1Q standard).

In the AVB specification, at least one queue for a reserving stream under the Stream Reservation Protocol (SR stream) and at least one queue for a non-SR stream are present, and the queues for SR traffic is Highest priority queue.

The AVB-DMAC supports four traffic classes: SR class A, SR class B, network control (NC) traffic (gPTP frames), and best effort (BE) traffic. Allocating a specific queue to network control (NC) frames ensures the control of synchronization.

The AVB-DMAC realizes compliance with the AVB standards by handling queues with the following architecture (in terms of traffic classes).

- Four transmission queues (Q3, Q2, Q1, and Q0) are available.
- Q3 and Q2 are for SR streams (one each for class A and class B).
- Q1 is for low-bandwidth network control (NC) traffic (gPTP frames)
- Q0 is for other types of traffic (MSRPDU*¹, MVRPDU*², best effort (BE), etc.)

Notes: 1. MSRPDU: Multiple Stream Registration Protocol Data Unit

2. MVRPDU: Multiple VLAN Registration Protocol Data Unit

Fetching from queues proceeds in order of priority of the above traffic types. Three systems of priority are available through the setting of the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]). In the default priority scheme, which is called AVB mode 1 (selected by TGC.TQP[1:0] = B'01), operation of the AVB-DMAC is fully in accord with the AVB specification. AVB mode 2 (transmit queue priority bits (TGC.TQP[1:0] = B'11) is an alternative priority scheme and varies from the AVB specification. Using this scheme thus requires more care. The other setting is for non-AVB-mode transmission.

Table 46.14 Default and Alternative Priority Orders in AVB Transmission Mode

| Priority Schemes (AVB Mode) | Priority Order of Queues |
|-----------------------------|---|
| Default | Q3 (SR class A) > Q2 (SR class B) > Q1 (NC) > Q0 (BE) |
| Alternative | Q1 (NC) > Q3 (SR class A) > Q2 (SR class B) > Q0 (BE) |

Transmission Selecting Algorithm and CBS

The algorithm the AVB-DMAC applies to select frames for transmission is in accord with the specifications under section 11.6.8, Transmission selection, of the IEEE 802.1Q standard. For AVB mode, the CBS (credit-based shaping) algorithm is applied to the class A and class B SR queues (Q3 and Q2). Use of the CBS enables correct handling of the priorities of transmission from the SR queues. For the CBS algorithm, see section 46.3.6 CBS (Credit-Based Shaping).

When the following conditions both hold, transmission from an SR queue (Q3 or Q2) proceeds at the specified time.

- The queue contains at least one frame ready for transmission.
- The queue has available credit.
- Unless an SR queue satisfies the above conditions, a higher priority queue is not present (not ready for transmission).

A non-SR queue (Q1 or Q0) is selected if the conditions below both hold.

- The queue contains at least one frame ready for transmission.
- As well as the above condition, a higher priority queue is not present (not ready for transmission).

Figure 46.27 and Figure 46.28 are flowcharts of selection for transmission in AVB mode 1 (default) and AVB mode 2 (alternative).

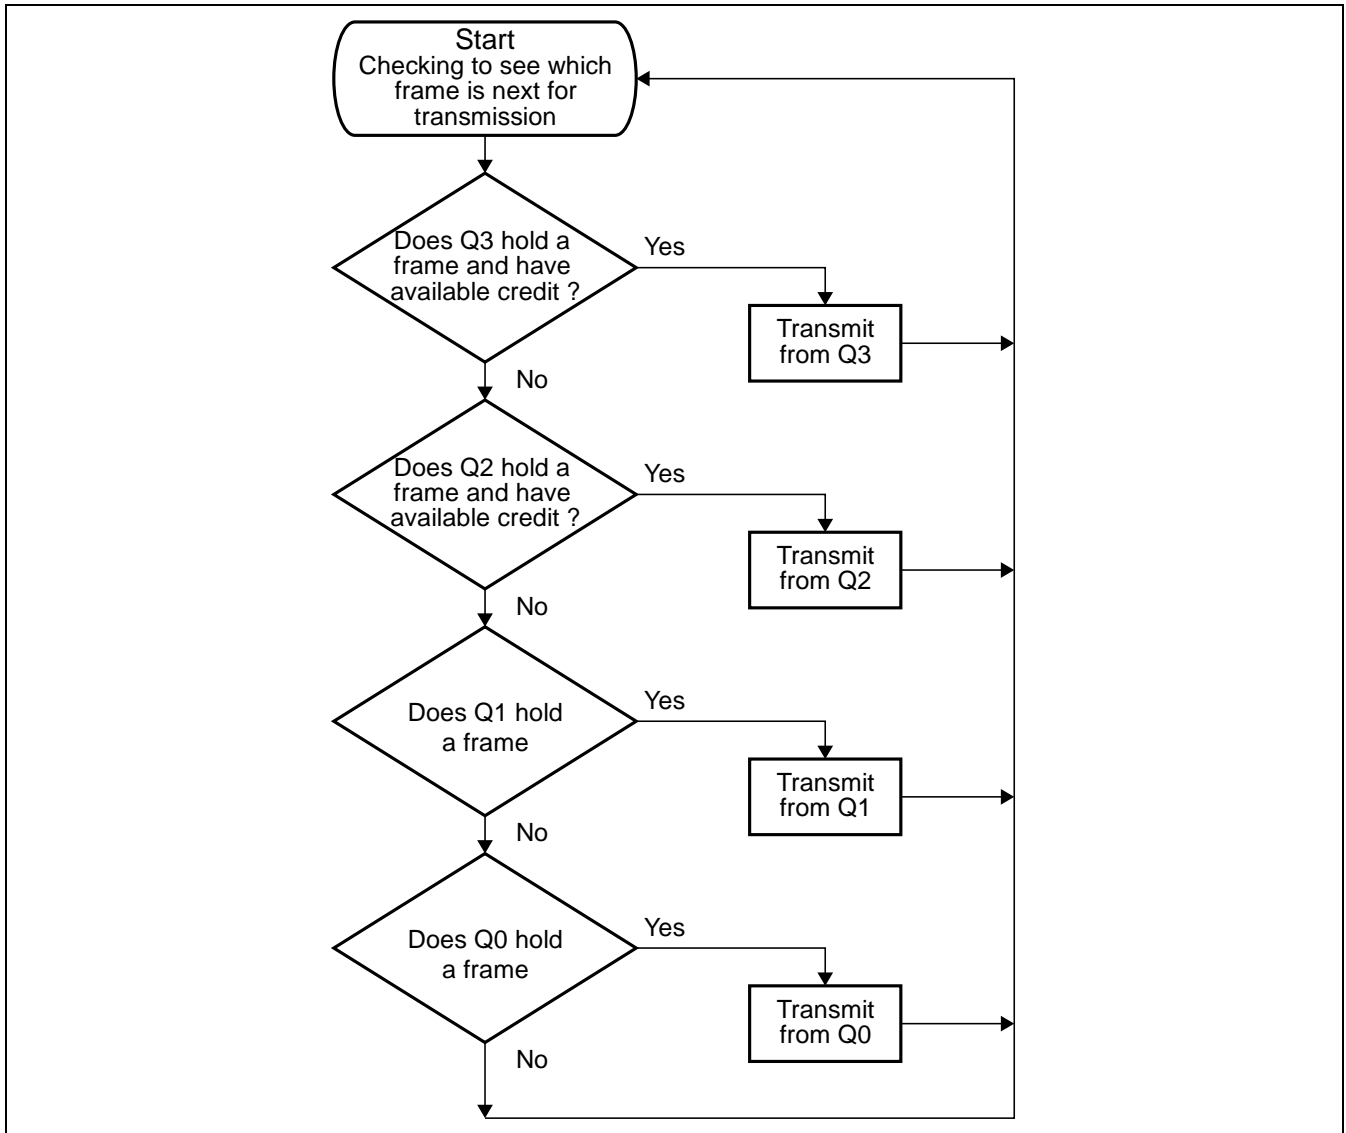

Figure 46.27 Flow of Selection for Transmission in AVB Mode 1 (Default)

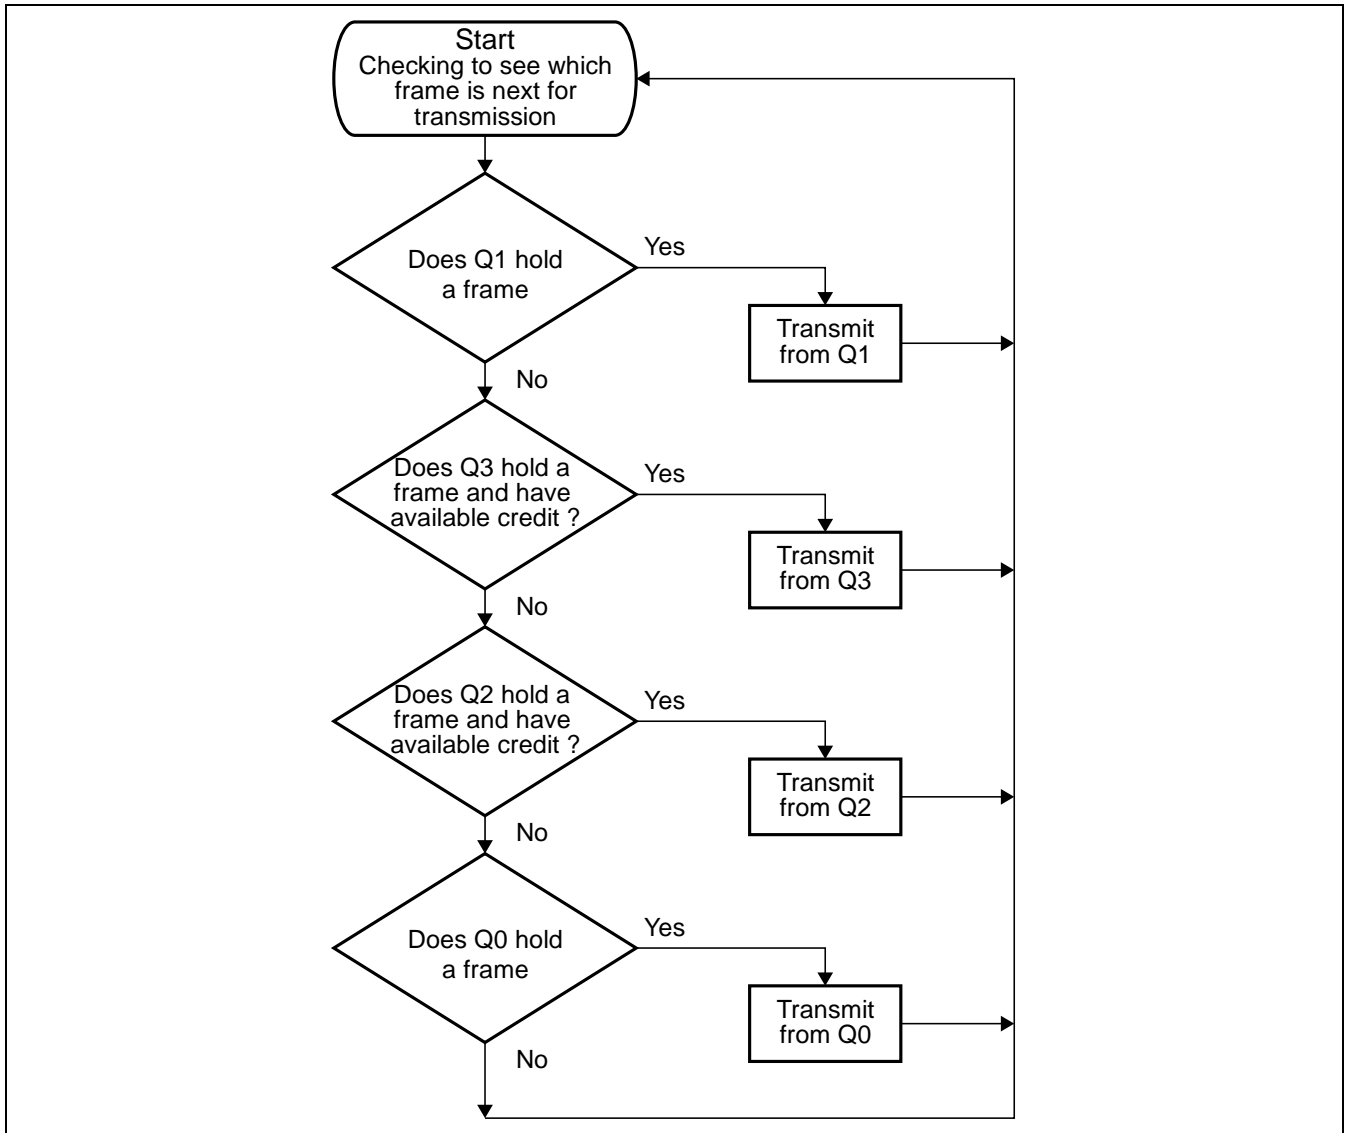

Figure 46.28 Flow of Selection for Transmission in AVB Mode 2 (Alternative)

(b) Non-AVB Transmission Mode

In non-AVB transmission mode, an absolute priority scheme is used. The SR class is not supported and the CBS algorithm is not used.

In non-AVB transmission mode (when the transmit queue priority bits in the transmit configuration register (TGC.TQP[1:0]) are B'00), data is fetched for transmission in a strict order of priority ($Q3 > Q2 > Q1 > Q0$).

Figure 46.29 shows the flow of selection in non-AVB transmission mode.

Figure 46.29 Flow of Selection for Transmission in Non-AVB Mode

(c) Setting the Size of the Transmission FIFO

The transmission FIFO is made up of 122 clusters. Each cluster can hold up to 128 bytes.

The size of the part of the transmission FIFO for use by each of the four transmission queues can be set by the corresponding transmit queue configuration q bits in the transmit control register (TGC.TBDq).

General Usage Examples:

Q0: Frames containing up to 1500 bytes $\rightarrow 1500/128 = 11.7 \rightarrow 12$ clusters

Q1: Frames containing up to 1024 bytes $\rightarrow 1024/128 = 8.0 \rightarrow 8$ clusters

Q3: Frames containing up to 1996 bytes $\rightarrow 1996/128 = 15.6 \rightarrow 16$ clusters

Q4: Frames containing up to 1996 bytes $\rightarrow 1996/128 = 15.6 \rightarrow 16$ clusters

When the depth of all transmission queues is 2, only the following number of clusters is required.

$$2 \times (12 + 8 + 16 + 16) + 16 = 2 \times 52 + 16 = 120$$

In the worst case (each of the transmission queues holds 1996 bytes), $2 \times 64 + 16 = 144$ clusters are required, so the maximum length of transmission frames must be less than 1996 bytes for some queues.

(2) Setting Up Transmission Descriptors

(a) Transmission Descriptor Type

The type of a descriptor is defined by the descriptor type (DESCR.DT) field.

Table 46.15 shows the descriptor types used in transmission.

Table 46.15 Descriptor Types in Transmission

| Descriptor Type (DESCR.DT) | Operation | Write-back |
|-----------------------------------|--|-------------------|
| Frame Start (FSTART) | The AVB-DMAC fetches the first of the data for the divided frame and proceeds to processing of the next descriptor. | FEMPTY |
| Frame Middle (FMID) | The AVB-DMAC fetches the second or subsequent data for the divided frame and proceeds to processing of the next descriptor. | FEMPTY |
| Frame End (FEND) | The AVB-DMAC fetches the last of the data for the divided frame. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor. | FEMPTY |
| Frame Single (FSINGLE) | The AVB-DMAC fetches the frame of data. The frame of data that has been fetched to the transmission FIFO is ready for transmission by the E-MAC, and then the AVB-DMAC proceeds to processing of the next descriptor. | FEMPTY |
| Link (LINK) | Processing proceeds to the descriptor specified by DESCR.DPTR. | LEEMPTY |
| Fixed Link (LINKFIX) | Same as LINK | Not changed |
| End Of Set (EOS) | This is a transmission stop point defined by software This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing proceeds to the next descriptor. | EEMPTY |
| Frame Empty (FEMPTY) | No frame data are ready for transmission This leads to clearing of the transmit start request bit (TCCR.TSRQt), which stops transmission. When the TCCR.TSRQt is again set to 1 (a new transmission start request is issued), processing starts at this descriptor. | Not changed |
| Link Empty (LEEMPTY) | Same as FEMPTY | Not changed |
| EOS Empty (EEMPTY) | Same as FEMPTY | Not changed |

(b) Configuration of Transmission Frame Data Descriptors

Figure 46.30 shows the configuration of descriptors for use with transmission queues. The transmission-specific fields (DESCR.MSR, DESCR.TSR, and DESCR.TAG) are described in Table 46.16.

For the other fields and the descriptor types, see section 46.3.3(6) Descriptor Type.

Figure 46.30 Configuration of Descriptor for a Transmitted Frame

Table 46.16 Configuration of a Transmission Descriptor

| Bit Name | Function |
|----------|---|
| MSR | <p>MAC Status storage Request</p> <p>This bit configures if E-MAC transmission status of the frame is stored in E-MAC status FIFO.</p> <p>0: No status information is stored</p> <p>1: Status information is to be kept for this frame in MAC status FIFO</p> <p>This bit is considered only if DESCR.DT = FEND or FSINGLE.</p> <p>Note: If there is error during transmission of frame by E-MAC then status is always stored.</p> |
| TSR | <p>Time Stamp Store Request</p> <p>This bit specifies whether the transmission time stamp is to be stored within the EthernetAVB-IF module.</p> <p>0: The time stamp status FIFO within the EthernetAVB-IF module does not retain a transmission time stamp.</p> <p>1: The time stamp status FIFO within the EthernetAVB-IF module retains a transmission time stamp.</p> <p>This bit is available while the current DESCR.DT is FEND or FSINGLE.</p> |
| TAG | <p>Frame Tag</p> <p>This TAG field is used to associate each frame data with a time stamp. Frame TAG is not required but is recommended.</p> <p>This bit is available while the current DESCR.DT is FEND or FSINGLE.</p> |

For the time stamp FIFO function, see section 46.3.5(4) Time Stamping in Transmission.

(3) Transmission

(a) Transmitting Frames

Setting the transmit start request bit in the transmit configuration control register (TCCR.TSRQt) starts the transfer of frames from the corresponding transmission queue.

The descriptor in the current descriptor address (CDARq.CDA) for the queue t (with q = t) is read first.

If this descriptor is a descriptor for frame transmission (FSINGLE, etc.), the AVB-DMAC fetches the frame data from the data area indicated by the descriptor, writes FEMPTY back to the descriptor type (DESCR.DT) bits to indicate completion of this processing, then proceeds to processing of the next descriptor.

If the descriptor is not for transmission, processing is as dictated by the given descriptor (for these descriptors, see the descriptions in section 46.3.3 Descriptors).

If a base address load request is issued for a descriptor chain while it is being processed (by setting 1 in the LBAq bit for transmission queue q that is currently being processed in the descriptor base address load request register, DLR), processing proceeds to the new descriptor chain. Changing the chain does not interrupt frame fetching, but note that frames that have not been fetched from the old chain remain where they are.

Figure 46.31 shows descriptor processing during transmission.

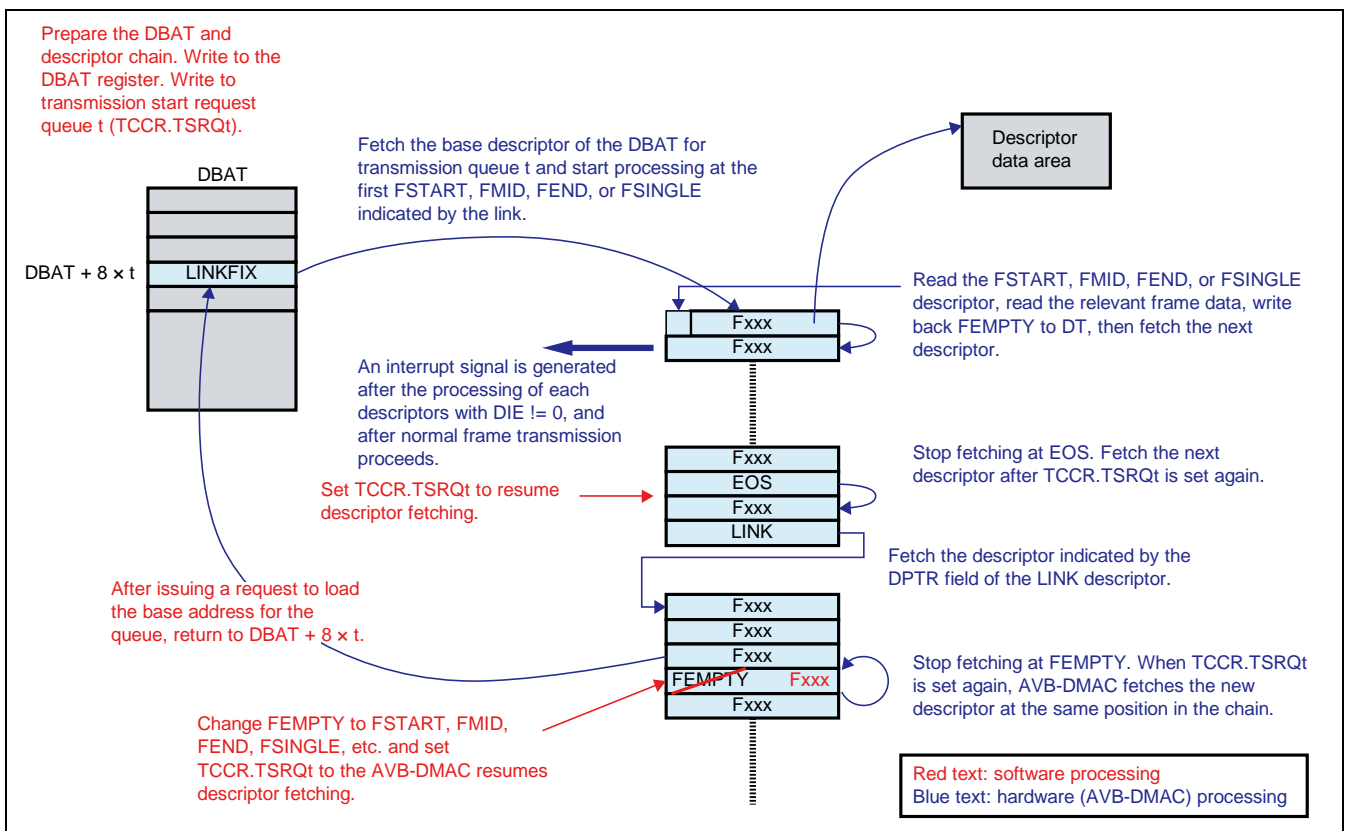

Figure 46.31 Descriptor Processing During Transmission

(b) Examples of Descriptor Usage

Immediate Frame Transmission

Immediate frame transmission is a pattern in which fetching by the AVB-DMAC starts whenever software adds data to a queue. FEMPTY descriptors are used as stop points to keep the hardware and software in synchronization.

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 46.32 shows the flow for software implementing this pattern. SW should read back written descriptor before changing FEMPTY descriptor before writing to TCCR.TSRQt.

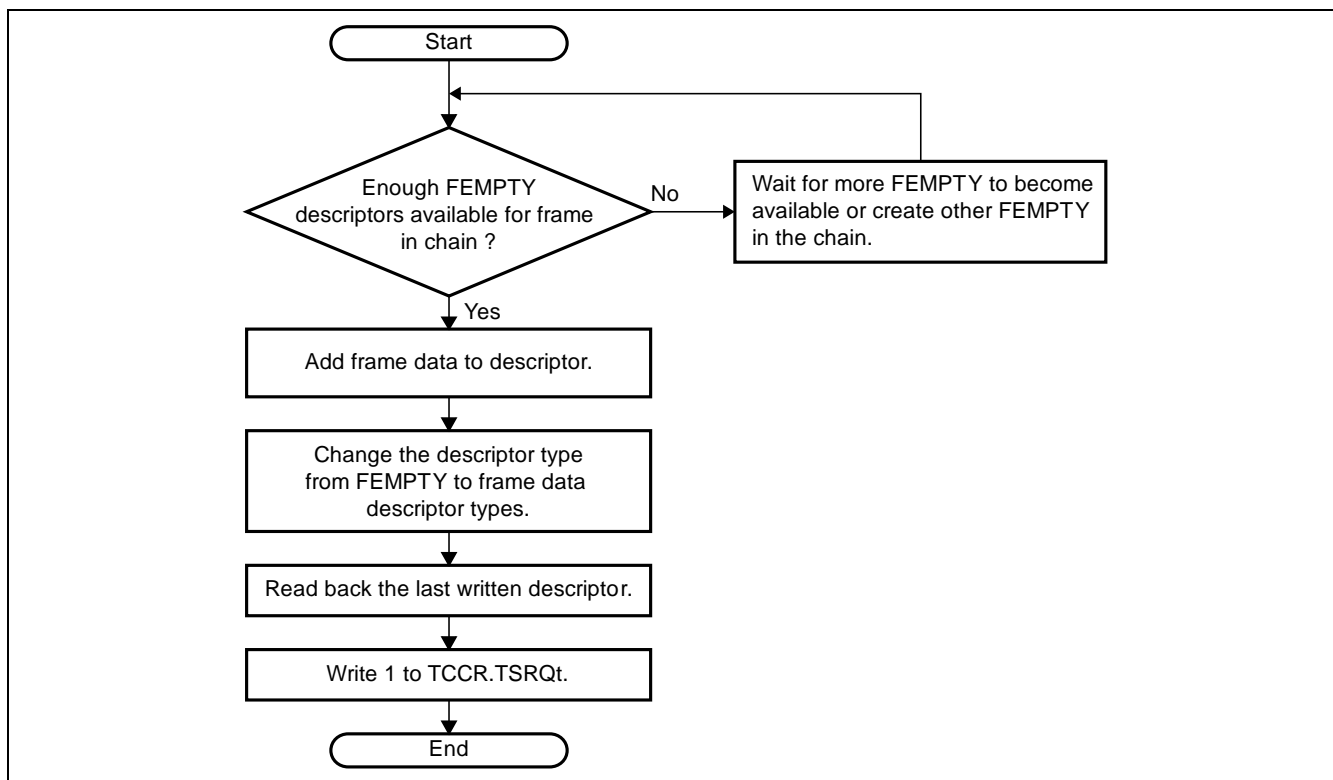

Figure 46.32 Software Flow for Immediate Frame Transmission

Figure 46.33 shows software and AVB-DMAC operations for immediate frame transmission.

Figure 46.33 Software and AVB-DMAC Operations for Immediate Frame Transmission

Frame Set Transmission with Changing of the Active Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. EOS descriptors are used for the stop points. Start by creating a descriptor chain that has a FEMPTY descriptor as its stop point.

Figure 46.34 shows the software flow in this pattern.

Figure 46.34 Software Flow for Frame Set Transmission with Changing of the Active Descriptor Chain

Figure 46.35 shows software and AVB-DMAC operations for frame set transmission.

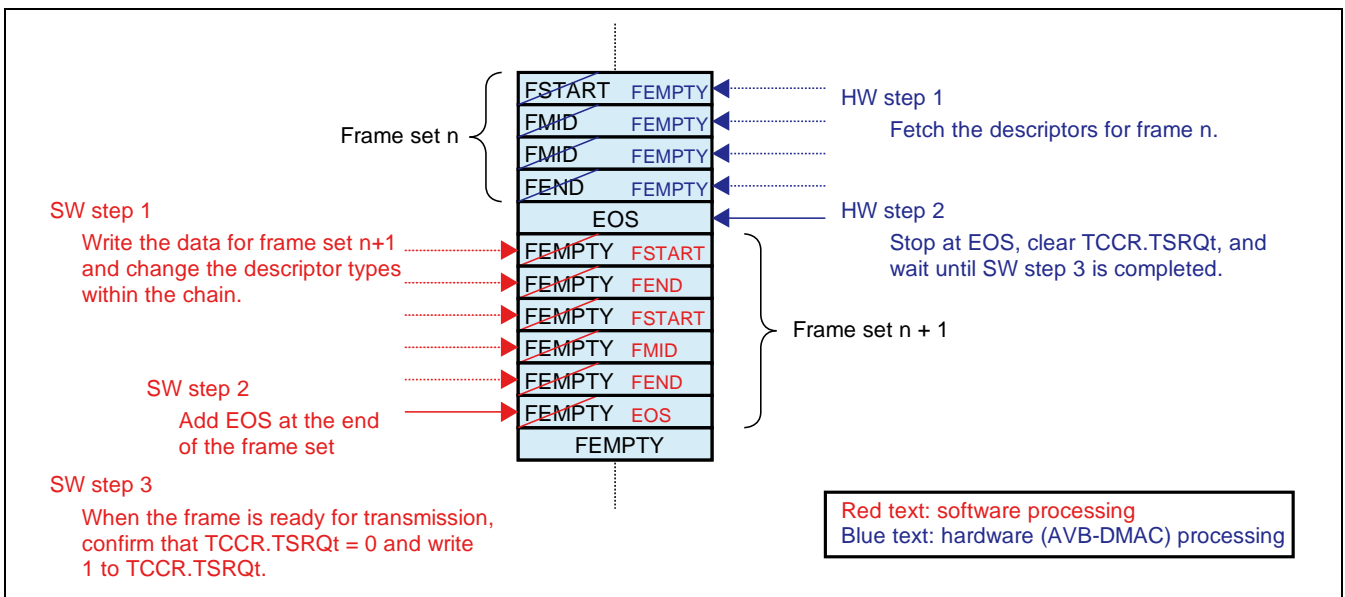

Figure 46.35 SW and AVB-DMAC Operations for Frame Set Transmission with Changing of the Active Descriptor Chain

Frame Set Transmission Using a Shadow Descriptor Chain

This pattern is used when data are transmitted with a delay for software control to secure bandwidth or for other reasons, rather than immediately transmitted. Two or more descriptor chains are used. The chains are classified as active or shadow chains. EOS descriptors are used for the stop points.

Create descriptor chains that have FEMPTY descriptors at the stop points.

Figure 46.36 shows the flow for software implementing this pattern.

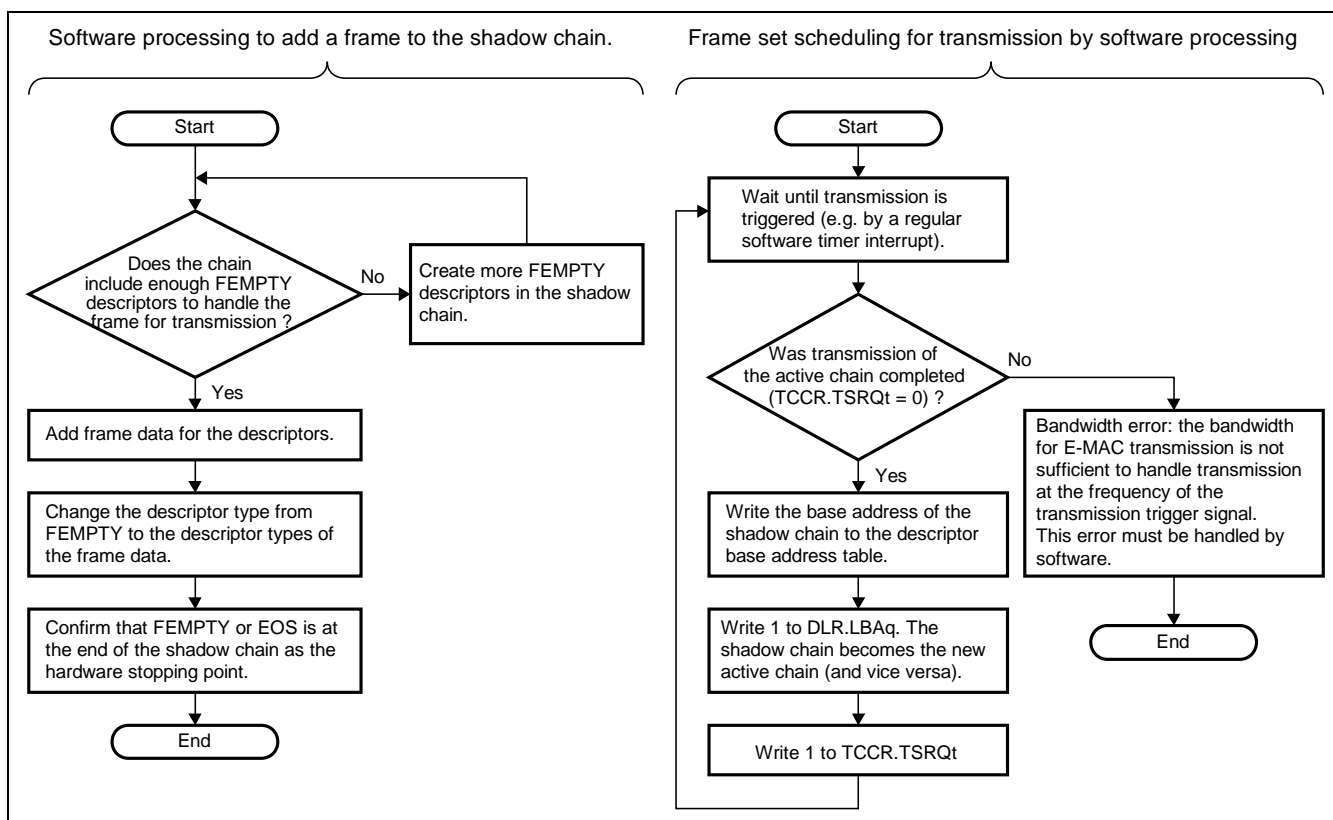

Figure 46.36 Software Flow for Frame Set Transmission Using the Shadow Descriptor Chain

Figure 46.37 shows software and AVB-DMAC operations for frame set transmission.

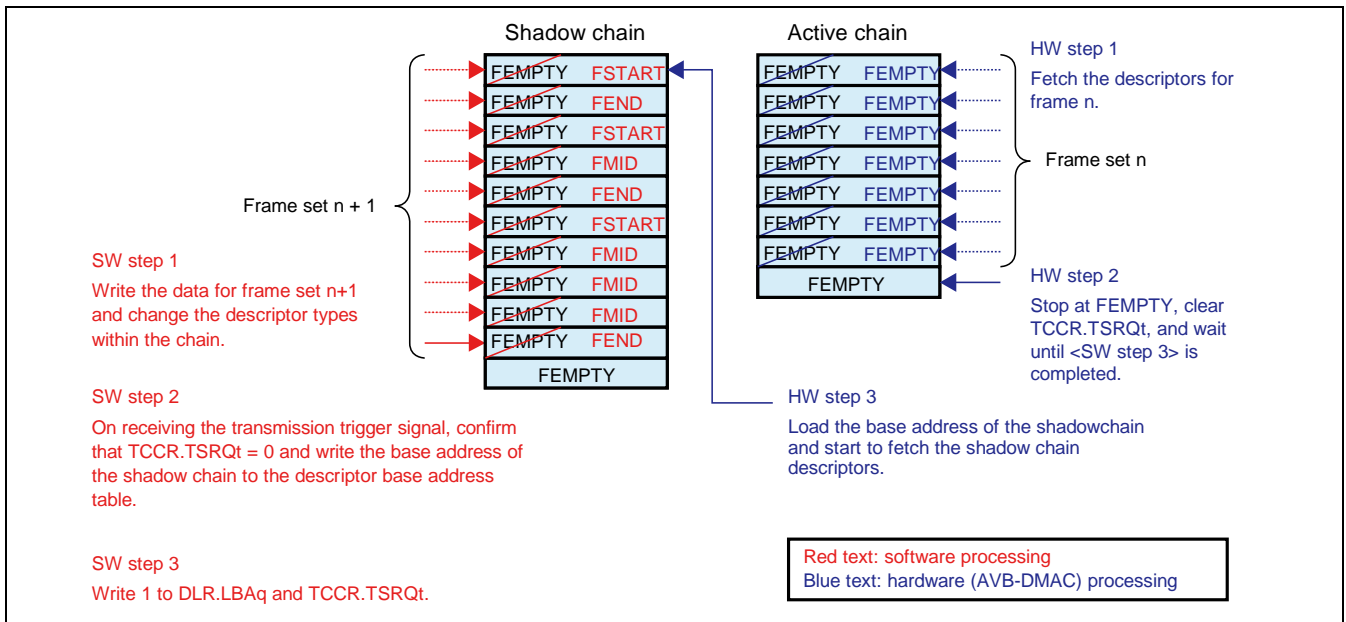

Figure 46.37 SW and AVB-DMAC Operations for Frame Set Transmission Using the Shadow Descriptor Chain

(4) Time Stamping in Transmission

Transmission time stamps are important in satisfying the requirements for timing and synchronization of the IEEE 802.1AS standard. Reference to this information can also be useful to other applications and in testing. The AVB-DMAC supports the storage of time stamps for transmitted frames. The time-stamp values are based on the gPTP timer and are captured at the same time as sending of the Start of Frame Delimiter (SFD) for transmitted frames.

When the time stamp storage request field (DESCR.TSR) is set to 1, selecting storage of a time stamp, the tag number defined in the tag field (DESCR.TAG) of the last descriptor (FEND or FSINGLE) for the frame being transmitted is stored with the time stamp. This eases identification and association. The time-stamp FIFO is accessible at any time.

Figure 46.38 shows the mechanism supporting transmission time stamping.

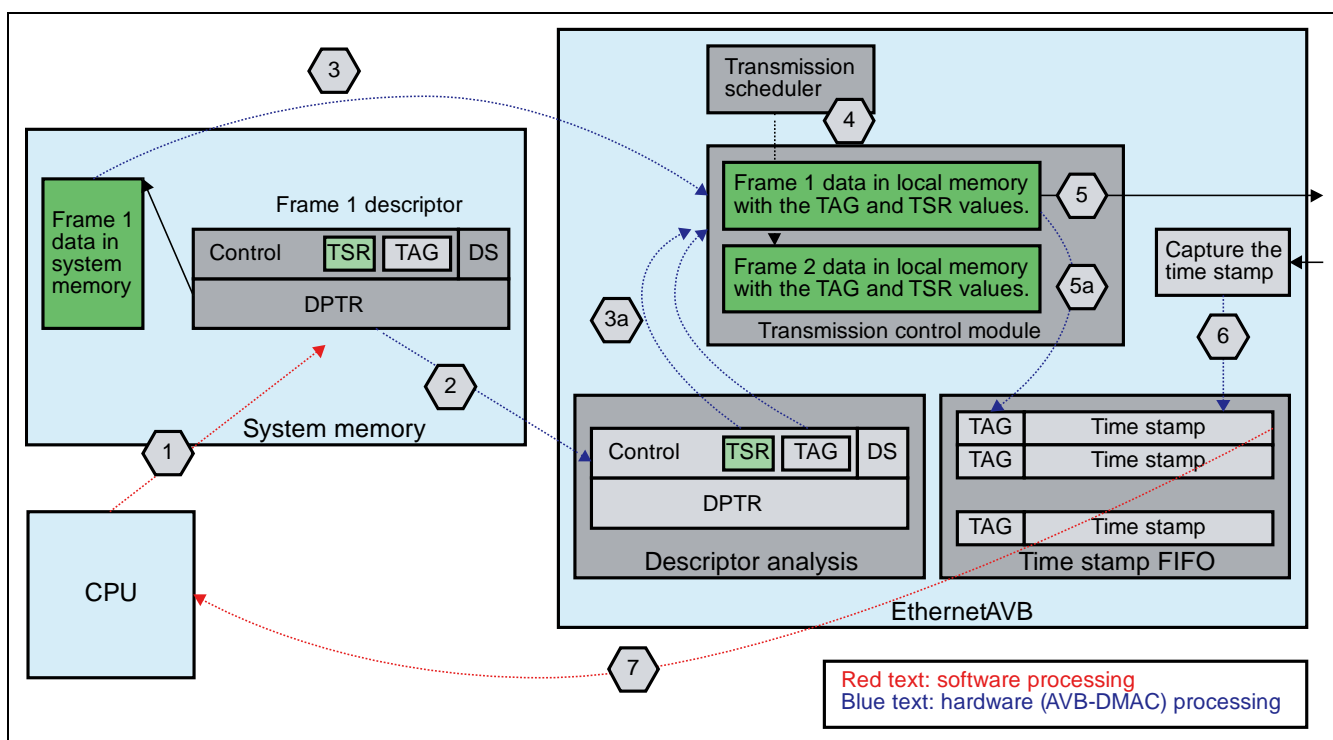

Figure 46.38 Mechanism to Support Transmission Time Stamps

The method of using this function is described below:

- Secure space in the URAM for the frame requiring time stamping.
Write the tag number of the frame to the frame tag field (DESCR.TAG) and set the time stamp storage request field (DESCR.TSR) to 1.
- The AVB-DMAC fetches and analyzes the descriptor. The time stamp storage request field (DESCR.TSR) is 1, so it recognizes that transmitting this frame also requires storage of the time stamp.
- The AVB-DMAC fetches the data for frame 1 and temporarily stores the frame in internal memory for scheduling.
3a: The frame tag field (DESCR.TAG) and time stamp storage request field (DESCR.TSR) are stored with the fetched data.)
- Under the control of priority settings according to credit-based shaping (CBS) or another scheme, the transmission scheduler decides it is time to transmit frame 1.
- Transmission of frame 1 starts.
5a: Frame 1's tag is stored in the time-stamp FIFO.
- The gPTP time stamp is captured at the start of frame delimiter (SFD) for transmission and stored with the tag in the time-stamp FIFO when the frame is completely transmitted. An interrupt is generated to indicate existence of new timestamp information. For this to happen, the descriptor interrupt control register (DIC) must be set beforehand.
- The entry can now be read from the time-stamp FIFO.

Use the time-stamp FIFO for the timing and synchronization of frames with IEEE 802.1AS compliance.

Time stamping can also be used with other frames, but take care not to allow the time-stamp FIFO to overflow. When the FIFO is full, further time stamps supplied to it are lost.

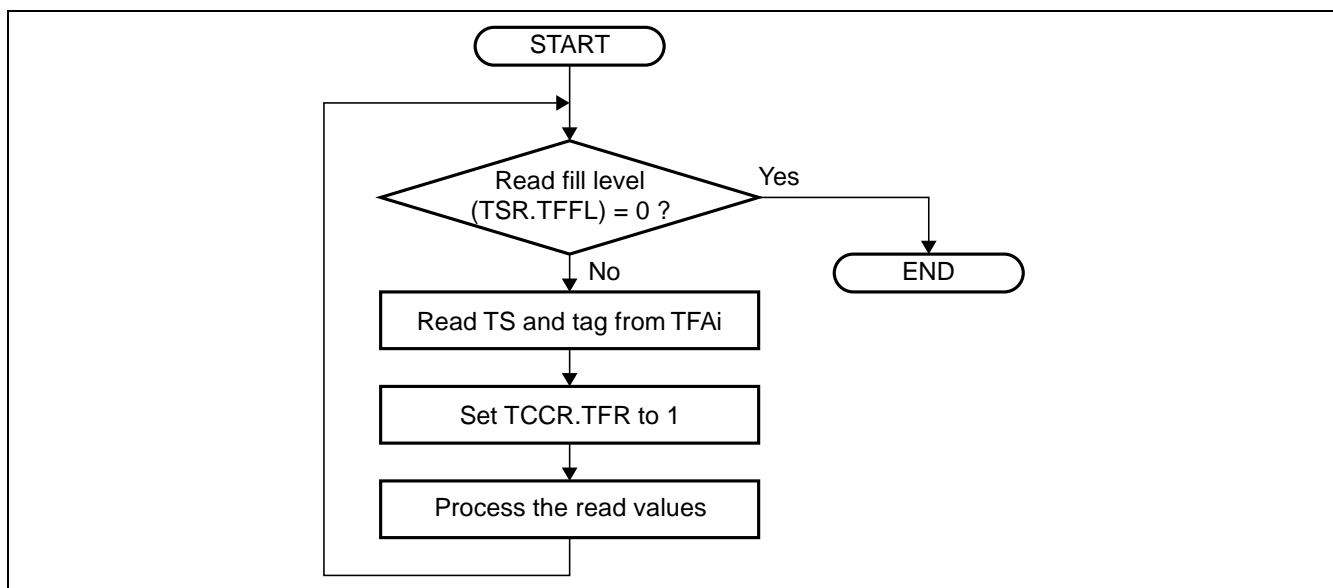

Figure 46.39 Flow of Transmission Time Stamping

(5) Ending Transmission

Figure 46.40 shows the procedure for ending transmission.

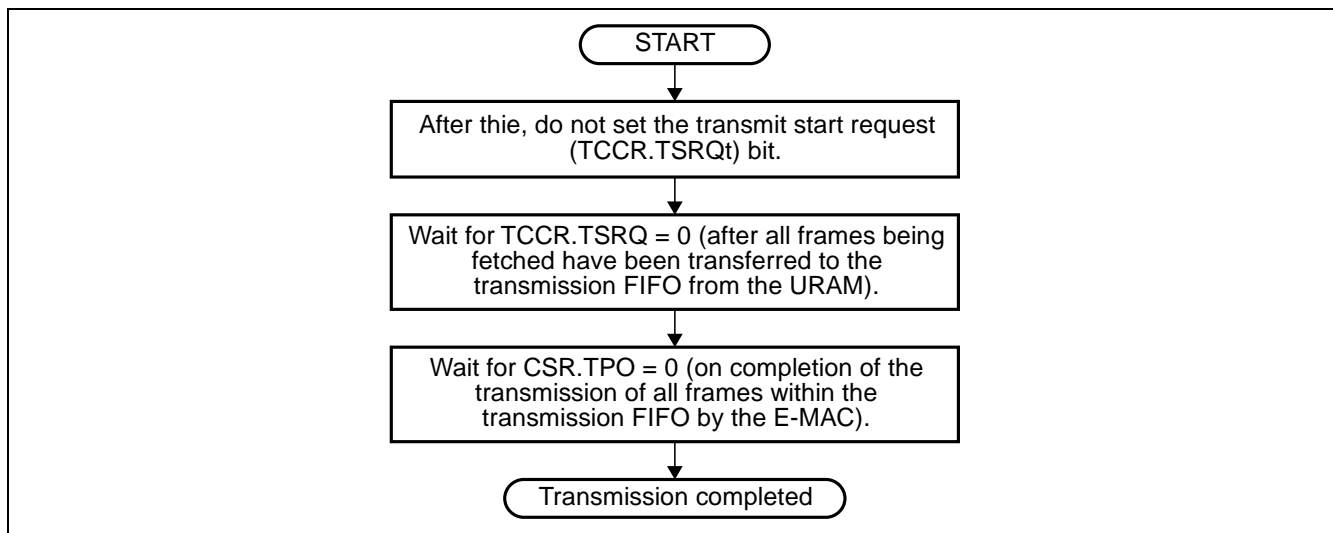

Figure 46.40 Procedures for Ending Transmission

46.3.6 CBS (Credit-Based Shaping)

In AVB transmission mode (i.e. when the transmit queue priority field in the transmit configuration register (TGC.TQP) is B'01 or B'11), transmission queues Q3 and Q2 are respectively assigned to class A and class B stream traffic and the CBS (Credit Based Shaping) algorithm is used to select the transmission queues in order to satisfy the Forwarding and Queuing for Time Sensitive Streams (FQTSS) specification (see section 11.6.8 or section 35 in IEEE 802.1Q).

The CBS algorithm is based on the concept of transmission credit for each queue. Credit can be thought of as the degree to which a queue has the “right” to transmit at a given time. Actually, in AVB transmission mode as specified in IEEE 802.1Q, queues that are subject to the CBS algorithm are able to transmit when the following conditions are met.

At least one frame is stored in the queue.

The credit for the queue is 0 or a positive value.

The credit for a transmission queue is incremented while one or more frames from the queue are present in the transmission FIFO but transmission of these frames is not proceeding. This state is indicated by the transmission process status bit for queue t in the AVB-DMAC status register (CSR.TPOt). The credit is decremented while transmission of a frame from the queue is in progress. This mechanism is used to control transmission so that the transmission of frames from the queues for each of the traffic classes does not exceed the specified maximum bandwidths.

IEEE 802.1Q defines the following parameters for queues under the control of the CBS algorithm.

portTransmitRate: Maximum transmission data rate of an external port. The E-MAC determines this parameter.

bandwidthFraction: Maximum fraction of portTransmitRate that can be used for a queue.

idleSlope: Rate of change of credit for a queue when transmission of frames from the queue is not proceeding so the credit value (in bits per second) is increasing. idleSlope is also equal to the maximum fraction of the total bandwidth (portTransmitRate) that is available to the given queue under a specified condition (frames from the queue can be placed in a continuous stream. See Annex L of IEEE 802.Q.

$$\text{idleSlope} = \text{bandwidthFraction} \times \text{portTransmitRate}$$

sendSlope: Rate of change of credit for a queue while transmission of a frame from the queue is in progress so the credit value is decreasing.

The value of sendSlope is defined as follows:

$$\text{sendSlope} = \text{idleSlope} - \text{portTransmitRate}$$

Furthermore, the values below are used to define individual traffic classes (or queues for the classes) under control of the algorithm. See Annex L of IEEE 802.Q.

maxFrameSize: Maximum size of frames (in bits) of the corresponding traffic class that can be transmitted from a port

maxInterferenceSize: Maximum burst size (in bits) by which delays for the corresponding traffic class can be allowed

hiCredit: Maximum credit value (positive number). Can be calculated by using the following equation: $\text{hiCredit} = \text{maxInterferenceSize} \times (\text{idleSlope} / \text{portTransmitRate})$

loCredit: Minimum credit value (negative number). Can be calculated by using the following equation:

$$\text{loCredit} = \text{maxFrameSize} \times (\text{sendSlope} / \text{portTransmitRate})$$

Figure 46.41 shows how the CBS algorithm works and the meaning of the above parameters.

Figure 46.41 CBS (Credit-Based Shaping) Operation

Figure 46.42 shows the implementation of CBS in the AVB-DMAC.

Figure 46.42 CBS (Credit-Based Shaping) Operation in the AVB-DMAC

The above implementation is based on “credit counters” for the respective traffic classes (SR class A and class B). The following parameters apply for these classes.

CBS increment value (CIV): Signed positive number

The credit is incremented by this amount every high-speed peripheral bus clock cycle while a frame from the queue is pending but transmission has not started (idleSlope).

CBS decrement value (CDV): Signed negative number

The credit is decremented by this amount every high-speed peripheral bus clock cycle while transmission of a frame from the queue is proceeding (sendSlope).

The CBS increment value (CIV) and CBS decrement value (CDV) are defined as follows.

$$\begin{aligned} \text{CIV} &= \text{idleSlope} \times \text{Mfactor} \\ \text{CDV} &= \text{sendSlope} \times \text{Mfactor} \end{aligned}$$

Mfactor is a multiplier factor to ensure accuracy for CIV and CDV. CIV and CDV are calculated by using the following equations.

$$\begin{aligned} \text{CIV} &= (\text{portTransmitRate}/\text{HP}\phi) \times \text{bwFraction} \times \text{Mfactor} \\ \text{CDV} &= (\text{portTransmitRate}/\text{HP}\phi) \times (\text{bwFraction} - 1) \times \text{Mfactor} \end{aligned}$$

HP ϕ is the frequency of the high-speed peripheral bus clock. The credit counters are driven by the high-speed peripheral bus clock, so calculating the slope parameters for CBS requires (1/HP ϕ).

Use software to prepare Mfactor for the CBS parameters. All queues for the same class must have the same Mfactor for all CBS parameters. Mfactor for a specified class c can be changed during operation, unless transmission is pending for that class (i.e. the transmit process status bit in the AVB-DMAC status register (CSR.TPOt) = 0). At that time, the credit counter values for class A and class B are 0. Note that the credit value will not match a new incrementation or decrementation parameter if Mfactor is changed while the credit counter value is non-zero. Mfactor is not present in the AVB-DMAC registers.

Set the CIV and CDV parameters in the CBS increment value registers (CIVRc) and the CBS decrement value registers (CDVRc). These are treated as dynamic settings since they should be updated when streams are registered and erased in accord with IEEE 802.1Qat.

The AVB-DMAC also has CBS upper limit registers (CULc) (the upper limit registers for classes A and B) and CBS lower limit registers (CLLc) (the lower limit registers for classes A and B). Set Mfactor to match the credit value and set the upper limit (hiCredit) and the lower limit (loCredit) for each class as defined above.

$$\begin{aligned} \text{CUL} &= \text{hiCredit} \times \text{Mfactor} = \text{maxInterferenceSize} \times \text{bwFraction} \times \text{Mfactor} \\ \text{CLL} &= \text{loCredit} \times \text{Mfactor} = \text{maxFrameSize} \times (\text{bwFraction} - 1) \times \text{Mfactor} \end{aligned}$$

Example:

Assume that portTransmitRate = 100 Mbps, HP ϕ = 133.33 MHz and bwFraction = 3%. Then idleSlope and sendSlope represented as one bit vs. cycles of the high-speed peripheral bus clock are as follows.

$$\begin{aligned} \text{idleSlope} &= (\text{portTransmitRate}/\text{HP}\phi) \times \text{bwFraction} = 100/133.33 \text{ (Mbps/MHz)} \times 3\% = 0.023 \text{ bit per high-speed peripheral bus clock cycle} \\ \text{sendSlope} &= \text{idleSlope} - (\text{portTransmitRate} / \text{HP}\phi) = -0.727 \text{ bits per high-speed peripheral bus clock cycle} \end{aligned}$$

Let Mfactor be 100, then CIV and CDV parameters are determined as follows.

$$\begin{aligned} \text{CIV} &= \text{idleSlope} \times \text{Mfactor} = 2.3 \\ \text{CDV} &= \text{sendSlope} \times \text{Mfactor} = -72.7 \end{aligned}$$

(1) Restrictions on CIV, CDV and Mfactor

The maximum value (the minimum value for negative numbers) up to which the credit counter will not overflow determines the maximum values of CIV and CDV that can be set in the CBS registers. This maximum credit value is equivalent to the worst case of the hiCredit value, and the maximum values for class A and class B are calculated as follows.

<Conditions>

- Class A maximum value (hiCredit_max_classA)

classA bwFraction \cong 100%

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum frame size.

hiCredit_max_classA \cong maxInterferenceSize for class A = Interference due to one max. sized frame = header + max. size payload + CRC (2000 bytes) + preamble (8 bytes) + IFG (12 bytes) + processing_delay (\cong 80 bytes) \cong 2100 bytes

- Class B maximum value (hiCredit_max_classB)

classB bwFraction \cong 100%

Maintaining the proper relations in the transmission priority order requires waiting for a period equivalent to the maximum size of frames in the class A transmission queue and other transmission queues.

hiCredit_max_classB \cong maxInterferenceSize for class B = Interference due to two max-size frames = $2 \times$ hiCredit_max_classA \cong 4200 bytes

hiCredit_max_classA = 16800

hiCredit_max_classB = 33600

The maximum values that can be selected with Mfactor for the 32-bit signed counter without overflow are:

Mfactor_max_classA = $2^{31}-1 / \text{hiCredit_max_classA} \cong 127826$ and

Mfactor_max_classB = $2^{31}-1 / \text{hiCredit_max_classB} \cong 63913$.

A high degree of accuracy can be achieved even with a low bandwidth. In class B, bandwidthFraction = 0.05% and the bandwidth error < 0.1%.

The maximum value of CIV is calculated from the following equation.

$\text{CIV} = \text{idleSlope} \times \text{Mfactor} = (\text{portTransmitRate} / \text{HP}\phi) \times \text{bandwidthFraction} \times \text{Mfactor}$

When Mfactor is the maximum value and bandwidthFraction is the maximum value (up to 100%):

CIV_max_classA = $(\text{portTransmitRate} / \text{HP}\phi) \times \text{Mfactor_max_classA}$ and

CIV_max_classB = $(\text{portTransmitRate} / \text{HP}\phi) \times \text{Mfactor_max_classB}$.

The maximum values when portTransmitRate = 1000 Mbps and HP ϕ = 133.33 MHz are as follows:

CIV_max_classA \cong 958719

CIV_max_classB \cong 479359

These values in the table are the limits of CIV up to which the 32-bit credit counter will not overflow. The CIV parameters are implemented as 16 bits + a sign bit, so a further limit of CIV \leq 65535 applies to both class A and class B.

(2) Credit Incrementation during Inter-Frame Gaps (IFGs)

The inter-frame gap (IFG) after a frame is transmitted is not treated as part of frame transmission by the CBS credit counter. During an IFG, the credit is incremented for all SR queues that have pending frames or negative credit. Figure 46.43 illustrates credit operations during IFGs.

Figure 46.43 Credit Operations during IFGs

Accordingly, the IFG need not be included in calculation of the bandwidth requirements for the specified SR class when deciding the idleSlope, sendSlope, and CIV and CDV parameters. However, IFG must also be included in the calculation in order to confirm that the total bandwidth allocated to all SR classes does not exceed 100% of portTransmitRate. This is described in Section 36.2.2.8.4 of IEEE 802.1Q.

(3) Example

The case of a class A 48-kHz stereo audio stream among Ethernet frames is described as an example.

After every class A measurement interval (125 μ s), 80 octets consisting of two sets of six 32-bit samples plus a 32-octet header are stored as audio data within a frame. The IEEE 802.3 also imposes a 42-octet media-specific framing overhead (an 8-octet preamble, 14-octet IEEE 802.3 header, 4-octet IEEE 802.1Q priority/VID Tag, 4-octet CRC, and 12-octet IFG) are also added. Accordingly, the total frame size is $80 + 42 = 122$, and one such frame is transmitted after every class measurement interval.

This represents a total bandwidth of about 7.8 Mbits per second ($122 \text{ octets} \times 8 \text{ bits per octet} \times 8000 \text{ frames per second}$) for this class. If the E-MAC is assumed to run at 1 Gbps (portTransmitRate), this is equivalent to the allocation of about 0.78% of the total bandwidth to each class A queue. If other traffic classes are to share the total transmission bandwidth, checking that this 0.78% allocation does not lead to the total allocation of bandwidth being greater than 100% of portTransmitRate is required.

To obtain the CIV and CDV parameters for a given class, the IFG must not be taken into account in calculation of the frame size must not include the IFG. For this case, therefore, we obtain an 80-bit payload + 30-bit overhead = 110-octet measurement interval for the class \rightarrow the total bandwidth for the class = 7.04 Mbps = 0.704% of portTransmitRate.

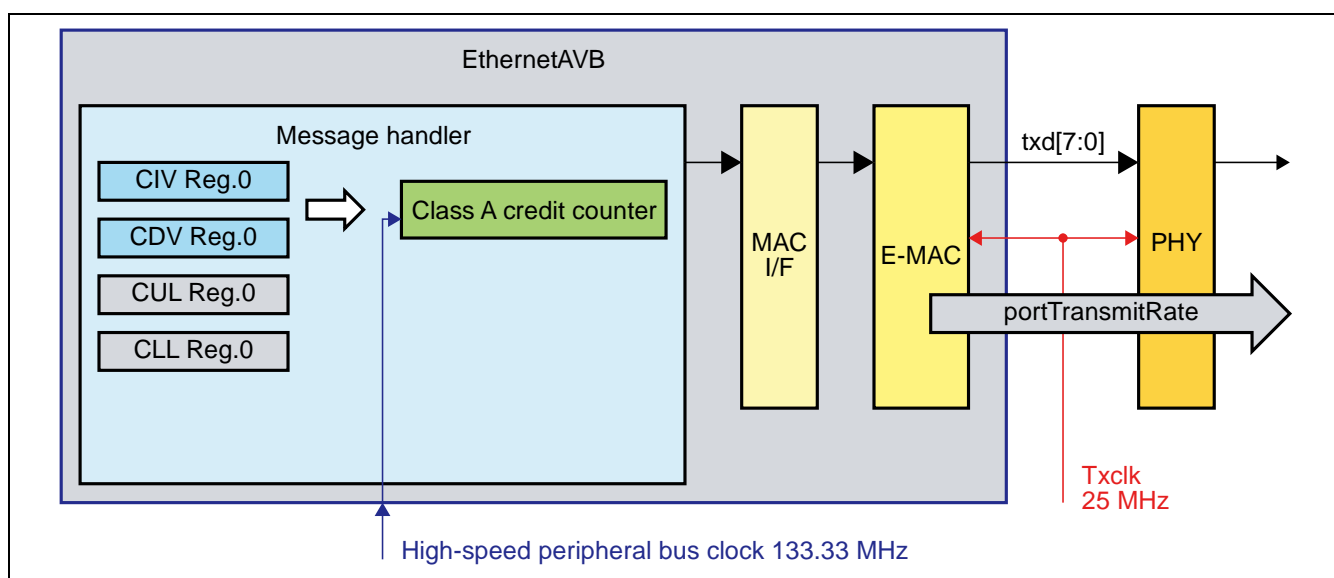

Figure 46.44 Example of CBS Settings

Given that:

- the E-MAC runs at 1000 Mbps, so portTransmitRate = 1000 Mbps and
- high-speed peripheral bus clock (operating clock for the credit counter) frequency = 133.33 MHz, securing a bandwidth of 7.04 Mbits/sec for class A requires configuring the CBS parameters as follows.

$$\text{bandwidthFraction} = 0.704\%$$

$$\text{idleSlope} = (\text{portTransmitRate} / \text{HP}\phi) \times \text{bandwidthFraction} \cong 0.0528 \text{ bits per high-speed peripheral bus clock cycle}$$

$$\text{sendSlope} = \text{idleSlope} - (\text{portTransmitRate} / \text{HP}\phi) \cong -7.44739 \text{ bits per high-speed peripheral bus clock cycle}$$

When Mfactor = 100000, the parameters are as follows.

- CIV = idleSlope \times Mfactor = 5280 bits per high-speed peripheral bus clock cycle
- CDV = sendSlope \times Mfactor = 744739 bits per high-speed peripheral bus clock cycle

These are the final values for setting in the CIVR1 and CDVR1 registers.

46.3.7 Time Synchronization

(1) gPTP Timer

An 84-bit timer is provided to support the gPTP function. Figure 46.45 shows the definitions of bits for the timer and in related registers.

Figure 46.45 Definitions of gPTP Timer Bits and Related Bits

The higher-order 32 bits indicate seconds. For the next 32 bits, counting by one corresponds to the passage of 1 ns. The lower-order 20 bits are a fractional value (less than 1 ns). Software can only read the 32 higher-order bits, indicating seconds, and the subsequent 32-bits, indicating nanoseconds. The 20 lower-order 20 bits, representing less than 1 ns, are not readable. They are only used within the AVB-DMAC to maintain accuracy in time measurement.

The timer can be reset by setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'01. These bits are set to B'00 on completion of normal resetting of the timer.

After the timer starts, the value in the gPTP timer increment register (GTI.TIV) is added to the value of the gPTP timer every clock cycle.

Before setting a value in the gPTP timer increment register (GTI.TIV), set the timer increment value setting request bit in the gPTP configuration control register (GCCR.LTI). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed.

An offset to the gPTP timer is also available. If this is required, set the value in the gPTP timer offset register (GTO.TOV). After setting a value in this register, set the timer offset value setting request bit in the gPTP configuration control register (GCCR.LTO). If this bit is not set to 1, new values that are written will not be reflected in the register. This bit returns to 0 after the setting is completed. When adding an offset, take care that it does not exceed 80 bits.

The value of the gPTP timer can be read from the gPTP timer capture register (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (TCCR.TCSS) to select the timer value for capture as the value of the gPTP timer, the corrected value of the gPTP timer (value with the offset added), or the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. Once normal capture of the timer is complete, the value of the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) returns to B'00.

The timer for gPTP operates as a free-running timer but can be synchronized with the Grandmaster clock.

(2) Free-Running Operation

The IEEE 802.1 AS standard for timing and synchronization does not prescribe the physical adjustment of local clocks to the Grandmaster clock. To avoid negative effects from the correction procedure, we recommend the use of a free-running timer.

As a free-running timer, the timer counts the local time in seconds or nanoseconds. The gPTP timer increment register (GTI.TIV) is set to 1 ns (the setting value = H'0010_0000) and the gPTP timer offset register (GTOi.TOV) is set to 0. The ratio information captured at the time of the gPTP delay measurement and synchronization procedures is used to correct the frequency ratio to that of the Grandmaster clock. The Grandmaster clock can be calculated from the local clock by using the information collected during the gPTP measurement and synchronization procedures.

(3) Synchronization with the Grandmaster Clock

In situations requiring physical synchronization of the local clock with the Grandmaster clock, the fractional nanoseconds value (the 20 lower-order bits of the gPTP timer) is used to make the adjustment. Specifically, the increment value is finely adjusted to correct for deviations of the clock frequency from that of the Grandmaster clock.

Use the timer offset value (in the gPTP timer offset registers, GTOi.TOV) to correct for offsets from the theoretical value (at start-up, etc.). The sum of the timer value and the offset register is the “corrected timer” value.

Note that for the nanoseconds part of the Offset register GTOi.TOV[31:0] should be below 10^9 .

The following equation gives a method of calculating the increment (GTI.TIV) from the frequency of the gPTP clock and its deviation from that of the Grandmaster clock. Variable d is the deviation ($d = 10^{-6}$ for 1 ppm).

$$GTI.TIV = round \left(\frac{2^{20} GHz}{f_{GPTP}} \times (1 + d) \right)$$

After adjusting for the current deviation of clock frequency, reset the gPTP timer increment register (GTI.TIV).

After calculating the new offset value, reset the gPTP timer offset register (GTOi.TOV).

(4) Continuous AVTP capture

CPU can request a selected timer value by setting bit GCCR.TCR to B'11. GCCR.TCSS determines which of the three values:

- gPTP Timer value,
- Corrected Timer value or
- AVTP Timer value

is captured in GCTi.CTV. GCCR.TCR is set to B'00 after capturing the related timer value. Successful capturing operation can be confirmed by checking GCCR.TCR is B'00.

By setting GCCR.TCR to B'10 continuous AVTP timer value capture is activated. In this mode CPU has always access to current AVTP value by reading GCTi.CTV[31:0].

Flow to enter continuous AVTP capture mode:

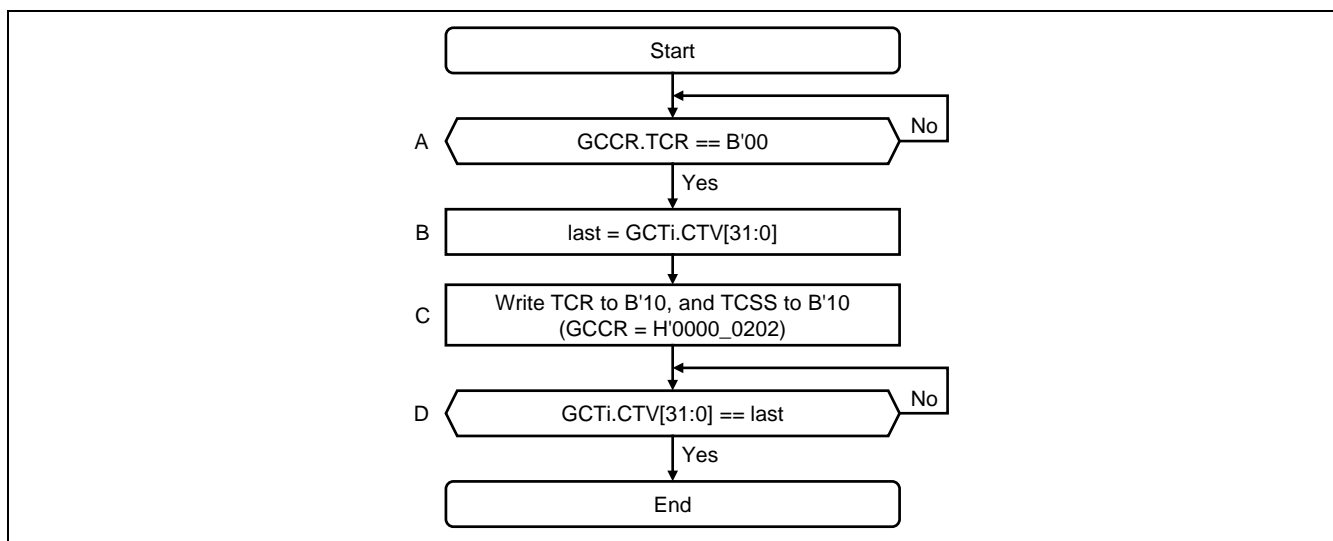

Figure 46.46 SW flow entering continuous AVTP capture mode

Flow to leave continuous AVTP capture mode:

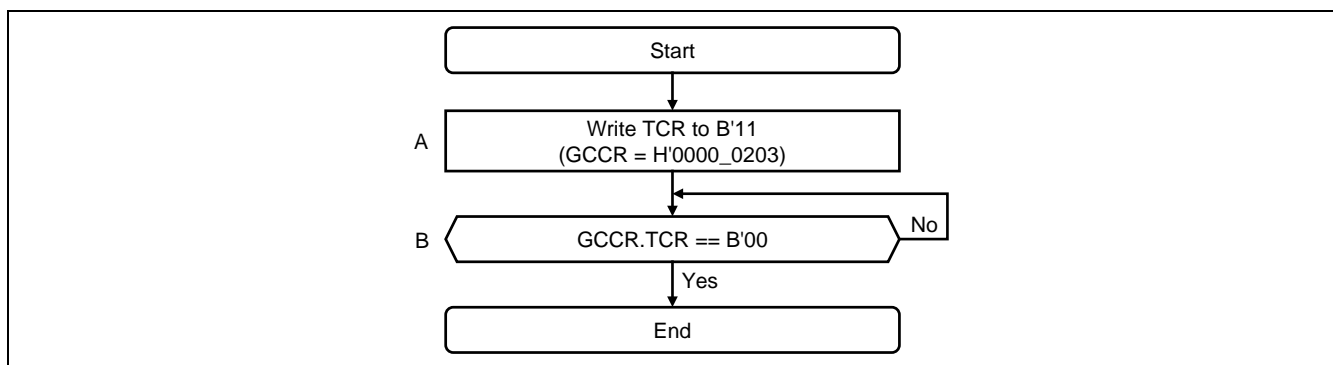

Figure 46.47 SW flow leaving continuous AVTP capture mode

(5) Support Provided by the gPTP Timer in Transmission and Reception

The timer value described above is used in the time-stamp values captured when start frame delimiters are detected in reception and generated in transmission at PHY interface.

Captured time stamp values for received frames are stored in the corresponding descriptors. Those for transmitted frames are stored with tag information in the time-stamp FIFO. The time stamp values are thus correlated with both transmitted and received frames.

Note that the use of corrected timer values can introduce an error due to the offset correction in the gPTP synchronization procedure.

Due to asynchronous interface between the SFD notification and the timer modules, errors must also be taken into account.

46.3.8 Support for IEEE 1722

For IEEE 1722, the following two functions are supported.

- Output and capture of values in the IEEE 1722 AVTP (Audio/Video Transport Protocol) presentation time format
- Comparison of IEEE 1722 AVTP presentation time stamps

The 32-bit AVTP time stamp field of IEEE 1722 frames holds the AVTP presentation time when the AVTP time-stamp enable bit in the frame is 1. The AVTP time stamp field is generated from the gPTP timer and is given as seconds (gPTP_seconds) and nanoseconds (gPTP_nanoseconds) according to the following equation.

$$\text{AVTP time stamp} = (\text{gPTP_seconds} \times 10^9 + \text{gPTP_nanoseconds}) \text{ modulo } 2^{32}$$

The AVTP presentation time can be read from the gPTP timer capture register (GCTi.CTV). Set the timer capture source select bits in the gPTP configuration control register (GCCR.TCSS) to select the timer value for capture as the AVTP presentation time. Setting the timer control request bits in the gPTP configuration control register (GCCR.TCR[1:0]) to B'11 initiates the capture. The value is obtained by adding the maximum transit time defined in the gPTP maximum transit time register (GMTT.MTTV) to the corrected timer value. The AVTP presentation time wraps around approximately every four seconds.

Note: The AVTP presentation time captured in GCTi.CTV is only valid when the corrected timer value is in synchronization with the Grandmaster clock. That is, the timer increment and timer offset values for the corrected timer value must be adjusted during the synchronization procedure so that the corrected gPTP clock is physically adjusted to match the time kept by the Grandmaster clock.

(1) AVTP capture(HW)

EthernetAVB-IF provides 17 units to capture AVTP based on external events.

Table 46.17 to Table 46.20 lists the assignment of the EthernetAVB-IF capture unit.

Table 46.17 Capture unit assignment for RZ/G2H

| Unit | signal | from | Function |
|--------------------|-------------------------|----------|---------------------------------|
| avb_pt_capture[0] | AVB_AVTP_CAPTURE | External | External input |

To allow proper detection of the edges of avb_pt_capture[i] signal, a pulse equal to or longer than 3 peripheral bus clock cycles should be provided on this input to trigger AVTP capture. Also SW should limit frequency of external capturing signal; period should be at least (6 peripheral bus clock periods + 3 gPTP periods).

There are two variants of capture units in EthernetAVB-IF:

- First one captures AVTP presentation time (including max transit time) and have overflow flagging.
- Second one captures AVTP timer value (without max transit timing) and have prescaler.

The AVTP capture units provides always the first captured value until SW has acknowledged reading of this value.

(a) AVTP presentation time capture unit

EthernetAVB-IF provides one capture unit of this functionality.

When a rising edge is applied to avb_pt_capture[0], AVTP presentation time is captured to GCPT.CPTV and the interrupt flag GIS.PTCF is set to 1.

The captured value includes the configured max transit time value.

Capture of a new AVTP presentation time is suppressed until CPU acknowledges processing of the captured value by setting GIS.PTCF to 0. GIS.PTOF informs about one or more lost capture events.

(b) AVTP timer capture unit

EthernetAVB-IF provides sixteen capture unit ($i = 0$ to 15) of this functionality.

Each N-times when a rising edge is applied to avb_pt_capture[i+1], AVTP timer value is captured to GCATi.CATV and the interrupt flag GIS.ATCFi is set to 1. The prescaler factor N is configured by GACP register for each unit individually.

The captured value does not include the configured max transit time value.

Capture of a new AVTP timer value is suppressed until CPU acknowledges processing of the captured value by setting GIS.ATCFi to 0.

(c) Prescaler configuration

CPU should use this flow to configure prescaler value of capture unit i:

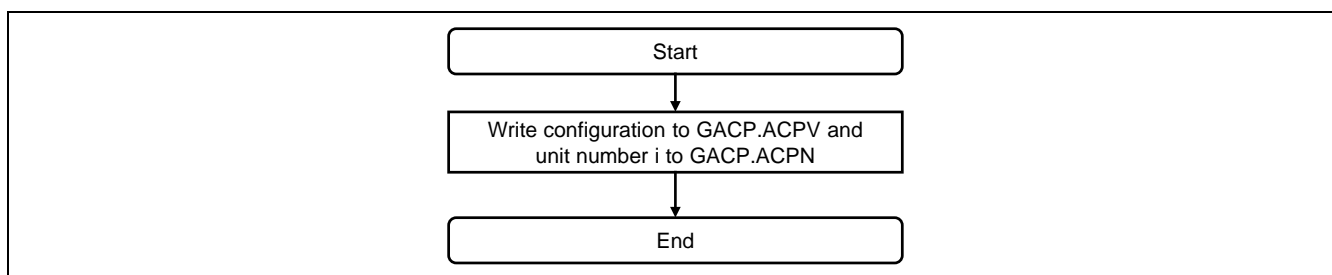

Figure 46.48 SW flow to program prescaler value of capture unit

This figure illustrates prescaler function of AVTP timer capture unit. The prescaler is free running, there is no visible relation which capture pulse triggers capturing of AVTP timer. When prescaler value is reconfigured, there may be one capturing based on old prescaler configuration.

Figure 46.49 Example of capture timing when prescaler value is reconfigured

It is recommended not to change prescaler value again before there is at least one match related to previous prescaler value flagged by GIS.ATCFi.

(2) AVTP compare

EthernetAVB-IF provides 8 independent AVTP compare units. Each unit is able to handle single shot comparison as well as periodic comparison. GSR.PCMi informs about the current mode of unit i. To 4 units (0 to 3) the single shot compare value can be provided via AVTP-FIFO to relax timing requirements to application SW.

When the AVTP Presentation Time value has reached or exceeded the configured comparison value the interrupt flag GIS.PTMFi is set to 1.

And Comparison unit 0, a pulse of one or four High speed Peripheral clock cycle is applied to AVB_AVTP_MATCH.

The configured max transit time value is not taken in count when comparing.

SW should ensure that configured comparison value is well in future to take into account SW inaccuracy.

SW should ensure that comparison value is not too far in future (more than 2 seconds) with respect to current AVTP timer value to guarantee comparison functionality.

When writing to GCCR, SW can use a 32 bit access if GCCR.TCSS is written to B'11 and all other bits not required for comparison value programming are written to 0.

(a) Single shot compare

An AVTP compare unit used in single shot mode generates exactly one match after CPU programs the comparison value.

CPU should use this flow to program absolute comparison values in single shot mode:

Figure 46.50 SW flow to program a single shot compare value

(b) Periodic compare

An AVTP compare unit used in periodic compare mode generates matches of configured period until CPU disables periodic mode. Optional it is possible to define the initial phase before repetition starts.

CPU should use this flow to start periodic compare mode or to change period value:

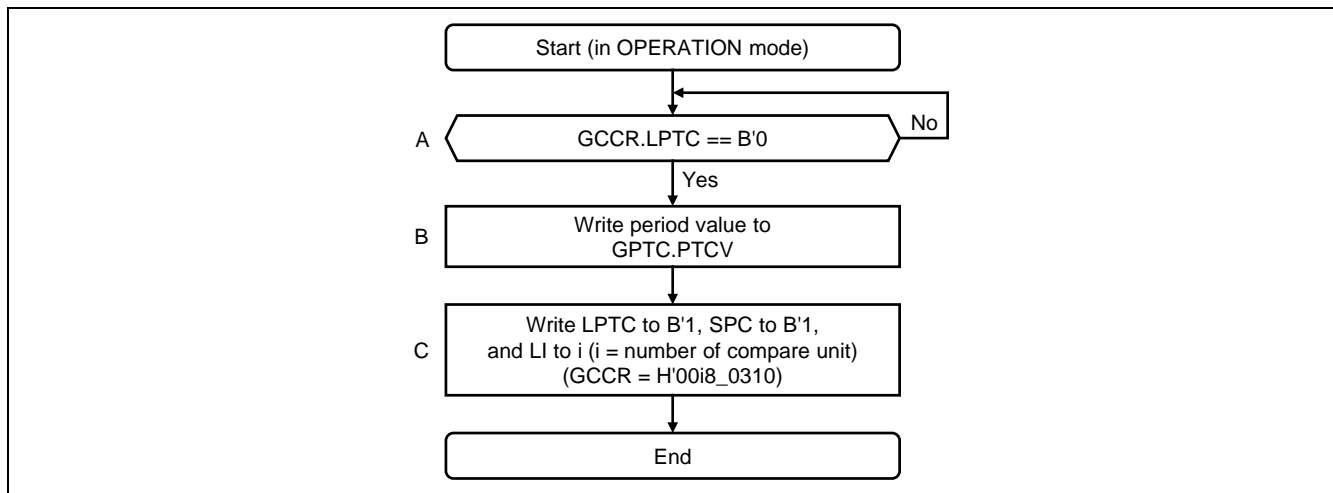

Figure 46.51 SW flow to program period value (without phase relation)

Some application may require phase relation between periodical match events generated by different units. In this case the next flow can be used to enter periodic compare mode with phase relation. A compare unit will only start a period when there is no pending comparison. If the absolute starting point of all units (box B in flow) is well in future the period of all units start at the same time (e.g. 48 kHz on unit 1 and 96 kHz on unit 2).

Figure 46.52 SW flow to program period value (with phase relation)

The periodic mode is left by entering single-shot mode. Do not write new comparison value in GPTC.PTCV for changing mode as shown in flow below, this value will not be used as new comparison value.

CPU should use this flow to leave periodic compare mode:

Figure 46.53 SW flow to end period mode

The last periodical comparison happens after Point B in SW flow. EthernetAVB-IF leaves periodic mode after last periodical comparison happens. This is flagged by GSR.PCMi. Comparison unit can only be reused after GCR.PCMi is 0.

(c) FIFO based single-shot comparison

Some comparison units provides the possibility to use timestamps from a FIFO. To use this possibility CPU writes AVTP timestamp to GPTFi instead of GPTC. By writing to GPTFi the value is added to FIFO, no load is required but CPU needs to check if AVTP-FIFO is able to accept new values.

FIFO usage may reduce CPU load because CPU can program a bunch of timestamps at same time.

When there is no comparison ongoing in AVTP compare unit, the next value from AVTP-FIFO is loaded and comparison starts. If the FIFO is empty no value is loaded and no further match event is generated.

When moving from single-shot comparison to FIFO based single-shot comparison, the 1st FIFO value is immediately loaded independent of an ongoing comparison.

By reading GSR.AFFLi CPU can observe number of pending timestamps.

CPU should use this flow to add timestamps to the AVTP-FIFO of compare unit. If FIFO depth is insufficient, FIFO size should be extended in SW (box E).

Figure 46.54 SW flow to add timestamp to AVTP-FIFO

It is recommended to combine box A and B into one access to limit accesses to GSR register.

(3) Pulse per second

EthernetAVB-IF provides by AVB_AVTP_PPS a pulse signal, which is generated at carryover of the nanosecond part of timer.

By GCCR.PGM it is selectable if the carryover of the gPTP timer (B'0) or the corrected gPTP timer (B'1) is used.

The pulse has a length of 32 gPTP clock cycles.

The CPU should not configure an offset correction value of 0 when using the corrected gPTP timer as source (GCCR.PGM is 1) for pulse per second function.

Note: A pulse may be lost or added when using the corrected gPTP timer as source and changing the offset value.

(a) Changing pulse per second source

When gPTP timer functionality is used in CONFIG mode (CCC.GAC is 1), following flow should be used to change pulse per second source by GCCR.PGM. When CCC.GAC is 0, CPU can change GCCR.PGM at any time.

Figure 46.55 SW flow to change GCCR.PGM when CCC.GAC is 1

The increment value of 0 in box B intentionally violates SW restriction of GTI.TIV.

To limit side effects to other gPTP functions 8 bit access to GCCR should be used in box B and E.

EthernetAVB-IF does not guarantee that value read from GTI.TIV is same value as increment value used by timer. Due to this it is recommended, to use in box E. the increment value intended by SW.

(4) gPTP timer functionality in CONFIG mode

When CCC.GAC is 1, it is possible to use some gPTP functions in CONFIG mode. Because the frame handling mechanisms are not available in CONFIG mode, usage of gPTP support is restricted. Only basic timer functions of gPTP support can be used:

- gPTP timer is running based on selected clock source (CCC.CSEL),
- Offset and increment value can be configured and adjusted
- SW capture function (timer, corrected timer, AVTP)
- HW capture function (AVTP)
- SW compare function

Note: There is SW flow required to change pulse per second source when gPTP timer is used in CONFIG mode. See section 46.3.8(3)(a) for details.

When AVTP FIFO functionality is used in CONFIG mode, there is no error flagging by ESR.ET = B'1011 available. CPU can use error flagging by external RAM protection directly, there are no other read accesses to RAM by EthernetAVB-IF.

46.3.9 Flow Control

The EthernetAVB-IF does not support flow control in the specification. Flow control is only effective when transmitting and receiving only normal (non-AVB) packets.

The E-MAC supports flow control for full-duplex operation in compliance with the IEEE 802.3 standards. This flow control is applicable to both reception and transmission. In regard to the transmission of PAUSE frames, flow control operates in the following ways.

(1) PAUSE Frame Transmission

PAUSE frames can also be transmitted in response to software operations. Writing a timer value to the manual PAUSE frame register (MPR) starts the transmission of a PAUSE frame. This only causes the transmission of one PAUSE frame.

(2) PAUSE Frame Reception

After reception of a PAUSE frame, transmission of the next frame does not proceed until the time indicated by the Timer value elapses. However, transmission of a frame currently being transmitted continues. PAUSE frames are only received while the RXF bit in the E-MAC mode register (ECMR) is set to 1. The number of received PAUSE frames is counted.

(3) PAUSE Frames with the Timer Value 0

The setting of the 0-time PAUSE frame enable bit (ECMR.ZPF) enables or disables the reception of PAUSE frames with the TIME parameter value 0.

- When control of PAUSE frames with the TIME parameter value 0 is disabled

PAUSE frames with the TIME parameter value 0 are not transmitted. Received PAUSE frames with the TIME parameter value 0 are discarded.

46.3.10 Magic Packet Detection

The E-MAC has a Magic Packet detection function. This function provides a facility for host devices and other sources to start other peripheral devices connected to a LAN. A peripheral device that handles Magic Packets starts itself in response to receiving a Magic Packet.

When a Magic Packet is detected, data from broadcast packets that were previously being received are stored in the FIFO and the E-MAC is notified of the receiving status. To return to normal operation from the associated interrupt processing, the E-MAC and AVB-DMAC must be initialized by using the operating mode configuration bit in the AVB-DMAC mode register (CCC.OPC) to set the operating mode to reset mode.

Magic Packets are received regardless of the destination address. As a result, the AVB_MAGIC pin is only enabled in the case of a match with the destination address specified in the Magic Packet.

The procedure for using the Magic Packet detection function with this LSI chip is as follows.

1. Use the various interrupt enabling and masking registers to disable the output of interrupts from interrupt sources.
2. Set the Magic Packet detection enable bit in the E-MAC mode register (ECMR.MPDE).
3. Set the Magic Packet detection interrupt enable bit in the E-MAC interrupt enable register (ECSIPR.MPDIP) to enable the interrupt.
4. Place the CPU in sleep mode as required.
5. An interrupt is conveyed to the CPU on detection of a Magic Packet.
6. The AVB_MAGIC pin notifies connected devices of Magic Packet detection.

Note: The Magic Packet detection interrupt status can be read in the E-MAC status register (ECSR.MPD). The bit can be cleared by setting the E-MAC status register Magic Packet™ detection bit (ECSR.MPD) to 1.

But EthernetAVB-IF can't detect 2nd or later Magic Packet™ and the AVB_MAGIC pin can be negated though the bit is cleared.

The AVB_MAGIC pin can be negated and EthernetAVB-IF can detect MAGIC Packet™ again according to below way.

- | | |
|-----------------------------------|---|
| 1) Hardware reset | set reset pin in the RZ/G series to reset signal. |
| 2) Software reset | set mstp/srst register for EthernetAVB-IF to software reset mode. |
| 3) Software reset register in AVB | set AVB DMAC mode register Operating Mode Configuration bits (CCC.OPC) to reset mode. |

46.3.11 Interrupts

The EthernetAVB-IF is capable of generating 25 interrupt (RZ/G2M V1.3, RZ/G2M V3.0).

The EthernetAVB-IF is capable of generating 27 interrupt (without RZ/G2M V1.3, RZ/G2M V3.0).

For details, refer to the “Interrupt Controller” section in the manual.

The interrupts of EthernetAVB-IF are indicated by individual flags DIS, EIS, RISi, TIS, and GIS. Each interrupt is controllable by the corresponding interrupt enable bit. The status flags are independent from this enable bits.

Additionally grouped interrupt status available in ISS and EIS.QFS. The summary status allows CPU to locate the interrupt source with a minimum number of read accesses to EthernetAVB-IF.

EthernetAVB-IF interrupts are combined to 4 groups of interrupt lines for request an interrupt service by CPU. Interrupt requests in group 0 and 1 are only generated in OPERATION mode. Interrupt requests in group 2 are only generated in OPERATION mode and in CONFIG mode if gPTP support is enabled (CCC.GAC). Interrupt request on line 3 depends on E-MAC configuration and can be generated in CONFIG, OPERATION and STANDBY mode.

Interrupt lines are level output and each line is asserted when at least one of the interrupt status registers bits belonging to the group associated with that line is set to 1, and the corresponding enable bit in the related interrupt control register is also set to 1.

For ISS bits the combined flag/enable is used. The green dots in detailed interrupt figures in detailed interrupt line description illustrates the point where status information for ISS is taken.

Table 46.21 Interrupt assignment

| Interrupt Name | Cause of interrupt | Second Generation RZ/G Series Products | | | |

(1) Concurrent interrupt enable support

The interrupt enable bits can be directly modified by writing the interrupt control registers (**xxC.yyE**). If concurrent processes enable/disable interrupts located in same interrupt control register inter-process communication is required. To reduce SW overhead there are dedicated registers available controlling conflict free enable/disable of interrupts.

To enable an interrupt CPU should write 1 to the corresponding bit (**xxE.yyS**) in the enable register. Because written 0 have no effect, there is no side effect to concurrent processes.

To disable an interrupt CPU should write 1 to the corresponding bit (**xxD.yyD**) in the disable register. Because written 0 have no effect, there is no side effect to concurrent processes.

The current interrupt enable status is readable in **xxC.yyE**.

Grouping of interrupts for each interrupt line is as described in following sub-chapters.

(2) Group 0 (Data related interrupts)

This group consists on:

Frame received interrupts **RIS0.FRFr** (for each received frame stored in URAM)

Receive warning interrupts **RIS1.RWFr** (when Unread Frame Counter reaches warning level)

Descriptor processed interrupts **RIS3.RDPFr** (for reception) Frame transmitted interrupts **TIS.FTFt** (for completion of frame transmission by E-MAC)

Descriptor processed interrupts **TIS.TDPFr** (for transmission)

Descriptor processed interrupts **DIS.DPFi** (for reception and transmission)

By reading **ISS**, CPU get an overview of all data related interrupts (**ISS.FRM**, **ISS.RWM**, **ISS.DPMi**, **ISS.FTM**).

Interrupt group 0 consists on these 24 interrupt lines:

Line0_Rx[17:0]

Line0_Tx[3:0]

Line0_DiA (Share the interrupt line: Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)

Line0_DiB (Share the interrupt line: Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

(a) Reception interrupts

There are 18 dedicated interrupt lines flagging frame reception. For the queue full flag it is configurable by CIE.RQFM if these notification are part of the queue specific reception interrupt lines or part of the error interrupt lines (group 1).

There is a common interrupt enable (CIE.CRIE) for all reception lines.

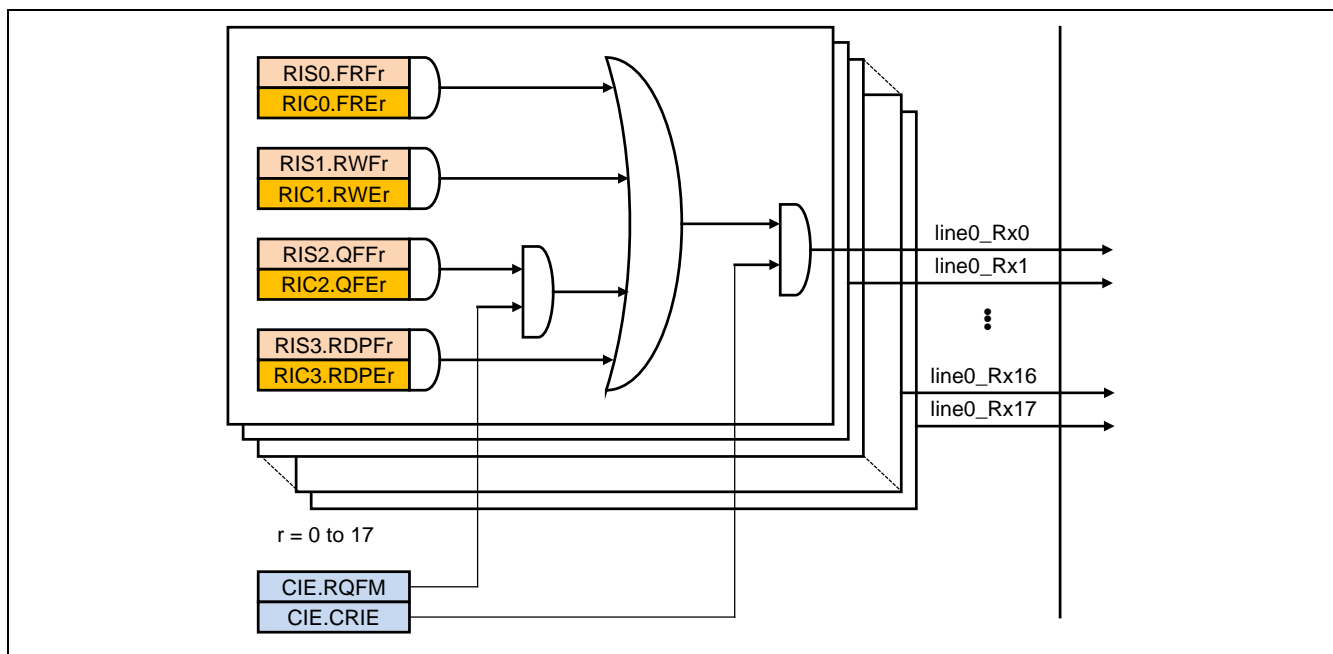

Figure 46.56 Interrupt group 0, reception interrupt lines

(b) Transmission interrupts

There are 4 dedicated interrupt lines flagging frame transmission.

There is a common interrupt enable (CIE.CTIE) for all reception lines.

Figure 46.57 Interrupt group 0, transmission interrupt lines

(c) Descriptor and merged interrupts

There are 2 interrupt lines flagging descriptor interrupts. Line line0_DiA has also the capability to generate a merged data interrupt (controlled by CIE.CL0M).

Descriptor interrupt 1 is not available as common descriptor interrupt; this descriptor interrupt is split into queue specific descriptor interrupts.

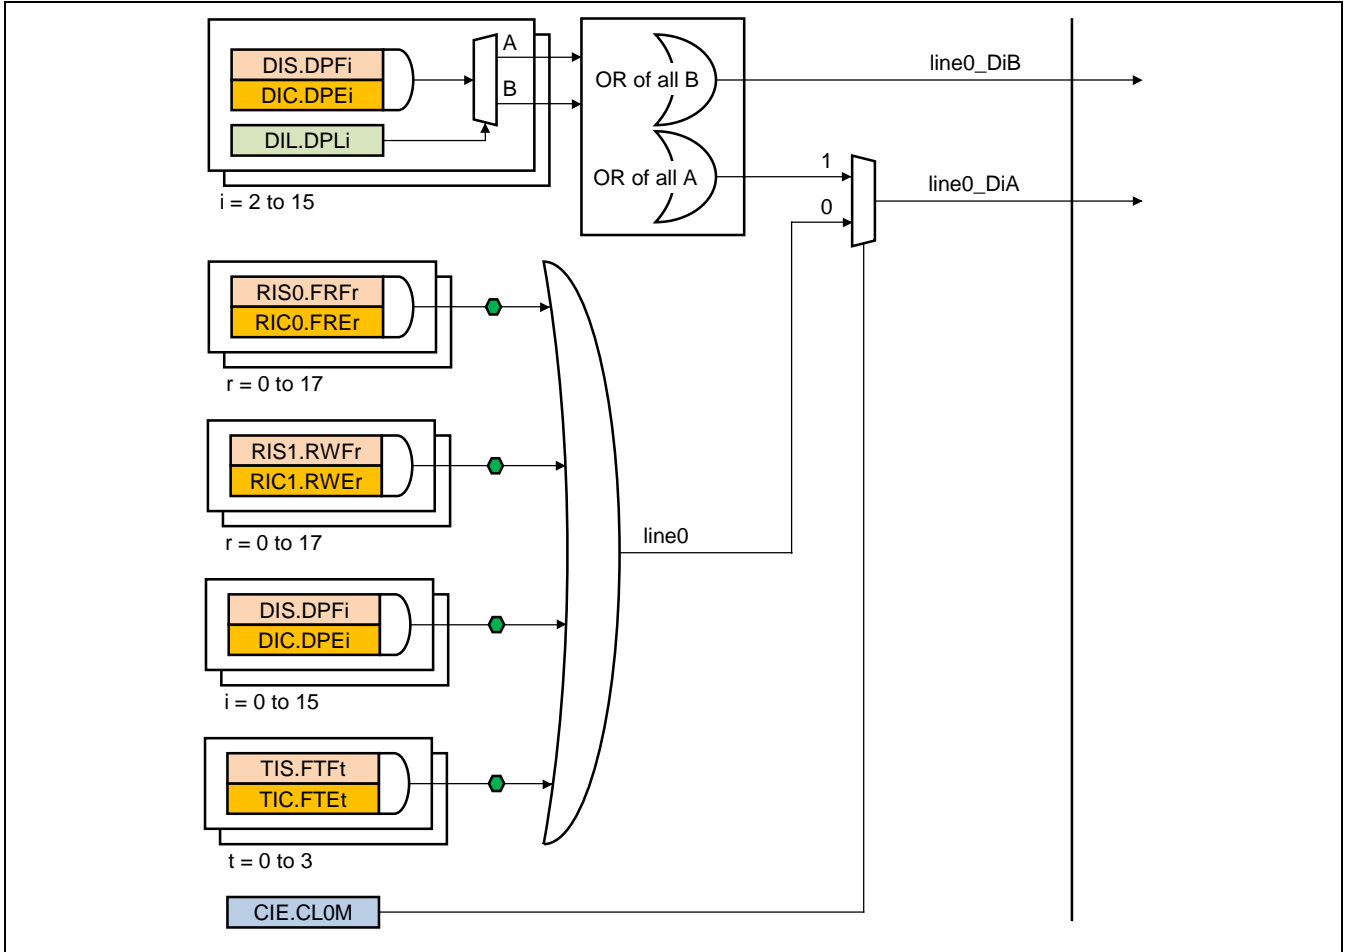

Figure 46.58 Interrupt group 0, common descriptor and merged interrupt lines

(3) Group 1 (Error related interrupts)

This group consists on:

- Tx-Buffer full interrupt EIS.TBFF (when delaying fetching of transmit frame)
- Interrupt for E-MAC Status FIFO overwrite (EIS.MFFF)
- Interrupt for Timestamp FIFO overrun (EIS.TFFF)
- Interrupts for CBS limits (EIS.CULF1, EIS.CULF0, EIS.CLLF1, EIS.CLLF0)
- Interrupt for separation filtering error (EIS.SEF)
- Interrupt for queue error (error while processing receive or transmit queue) (EIS.QEF)
- Interrupt for transmission error detected by E-MAC (EIS.MTEF, EIS.MREF)
- Rx-FIFO full interrupt RIS2.RFFF (when Rx-FIFO overflows)
- Receive queue full interrupts RIS2.QFFr (when no sufficient space is in receive queue)

By reading EIS, CPU get an overview of all error interrupts. Additionally ISS.EM informs about pending error related interrupt.

Interrupt group 1 consists on these 2 interrupt lines:

Line1_A (Share the interrupt line: Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)

Line1_B (Share the interrupt line: Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

For the queue full flag it is configurable by CIE.RQFM if these notification are part of the queue specific reception interrupt lines or part of the error interrupt line line1_A.

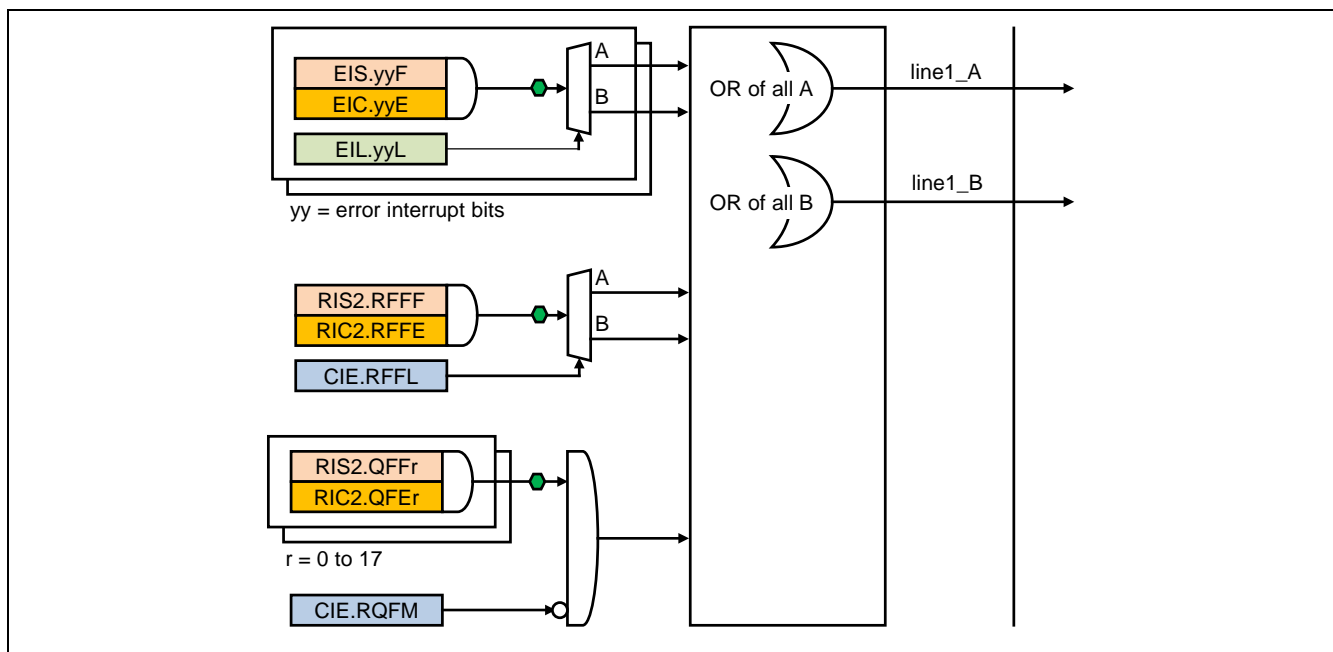

Figure 46.59 Interrupt group 1, error interrupt lines

The abbreviation yy in figure indicates error interrupts: TBF, MFF, TFF, CULFc, CLLFc, SE, QE, MTE, and MRE.

(4) Group 2 (Management related interrupts)

Reception

Rx-FIFO Warning interrupt RIS1.RFWF (Rx-FIFO has reached configured warning level)

Transmission

E-MAC status FIFO warning interrupt TIS.MFWF

E-MAC Status FIFO updated interrupt TIS.MFUF

Timestamp FIFO warning interrupt TIS.TFWF

Timestamp FIFO updated interrupt TIS.TFUF

gPTP

AVTP time captured interrupt GIS.ATCFi

AVTP presentation target matched interrupt GIS.PTMFi

AVTP presentation time overrun interrupt GIS.PTOF (when external trigger before old value is processed)

AVTP presentation time captured interrupt GIS.PTCF

By reading ISS, CPU get an overview of all management related interrupts (ISS.RFWM, ISS.MFWM, ISS.MFUM, ISS.TFWM, ISS.TFUM, ISS.CGIM).

Interrupt group 2 consists on these 2 interrupt lines:

Line2_A (Share the interrupt line: Group0.Line0_DiA, Group1.Line1_A, Group2.Line2_A)

Line2_B (Share the interrupt line: Group0.Line0_DiB, Group1.Line1_B, Group2.Line2_B)

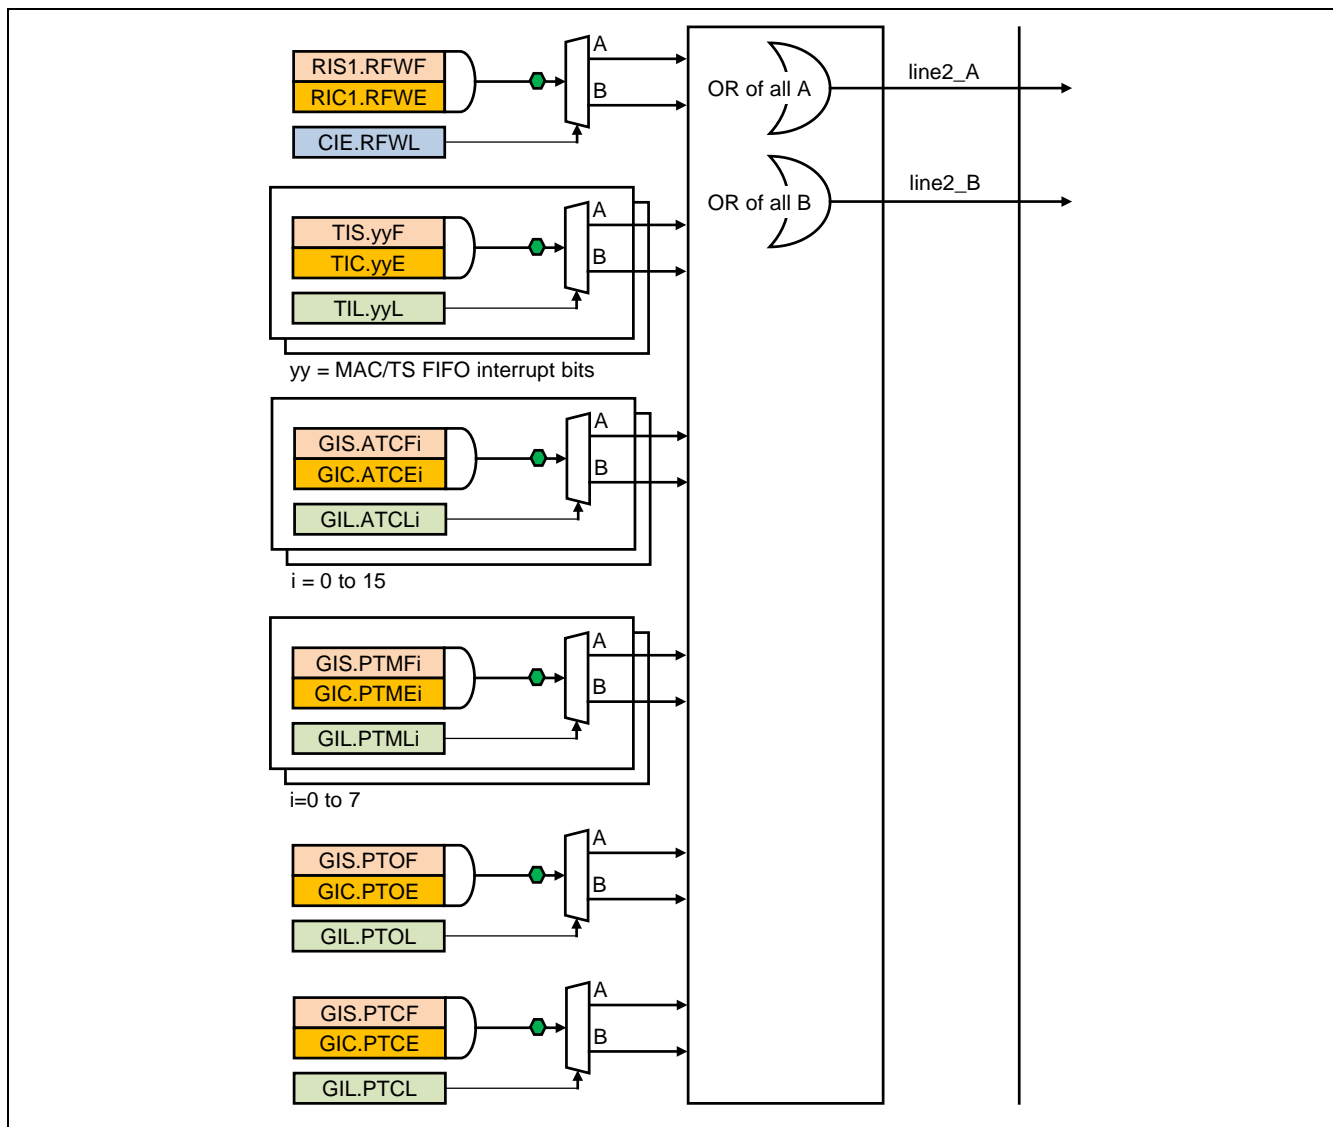

Figure 46.60 Interrupt group 2, management interrupt lines

The abbreviation yy in figure indicates error interrupts: MFW, MFU, TFW, and TFU.

(5) Line 3 (E-MAC interrupt)

The E-MAC interrupt is conveyed when the E-MAC interrupt source is generated.

The general error interrupt state can be checked by reading the E-MAC interrupt summary bit in the interrupt summary status register (ISS.MS).

46.3.12 Flows of Operations

(1) Flow of E-MAC Initialization

Figure 46.61 shows the flow of E-MAC initialization (for AVB mode and full-duplex operation).

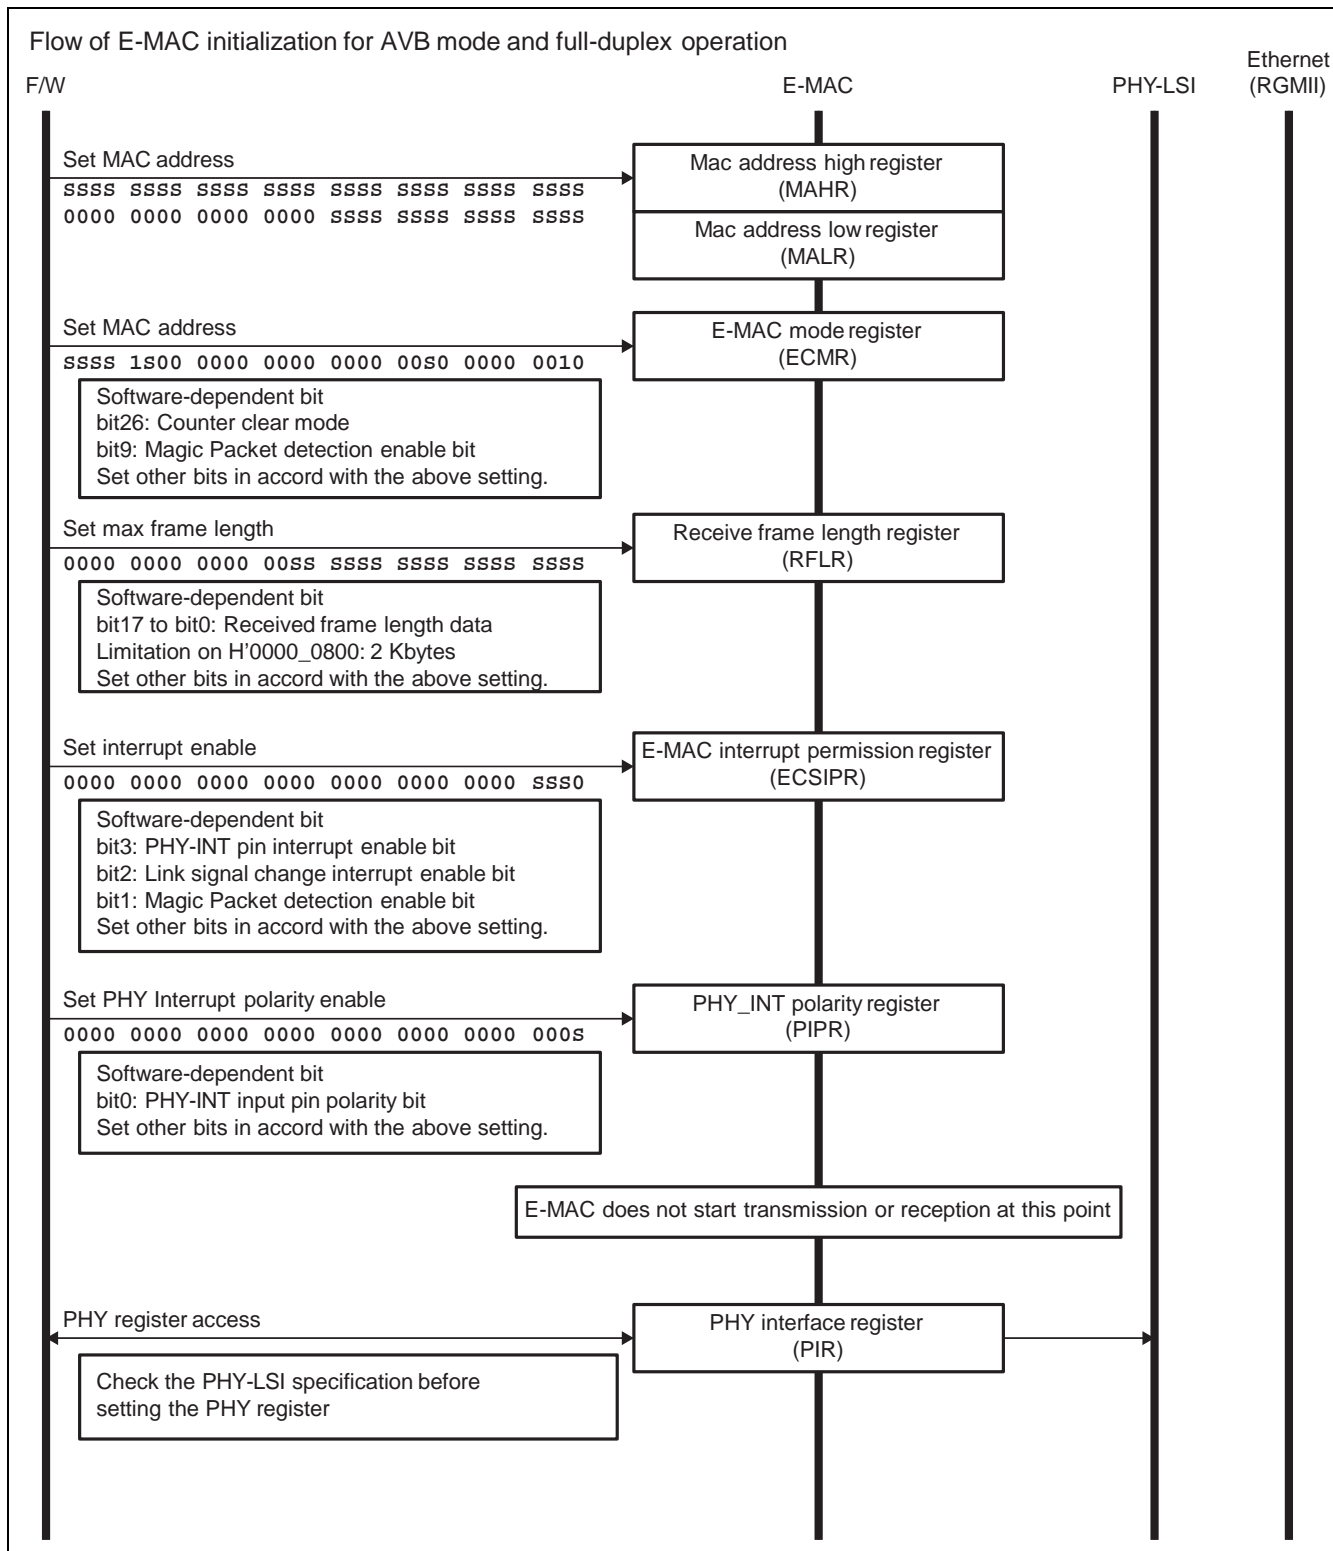

Figure 46.61 Flow of E-MAC Initialization (for AVB Mode and Full-Duplex Operation)

(2) Flow of AVB-DMAC Initialization

Figure 46.62 shows the flow of AVB-DMAC initialization (for AVB mode and full-duplex operation).

Figure 46.62 Flow of AVB-DMAC Initialization (for AVB Mode and Full-Duplex Operation)

(3) Flow for the AVB-DMAC in Reception

Figure 46.63 shows the flow for the AVB-DMAC in reception (in AVB mode and full-duplex operation).

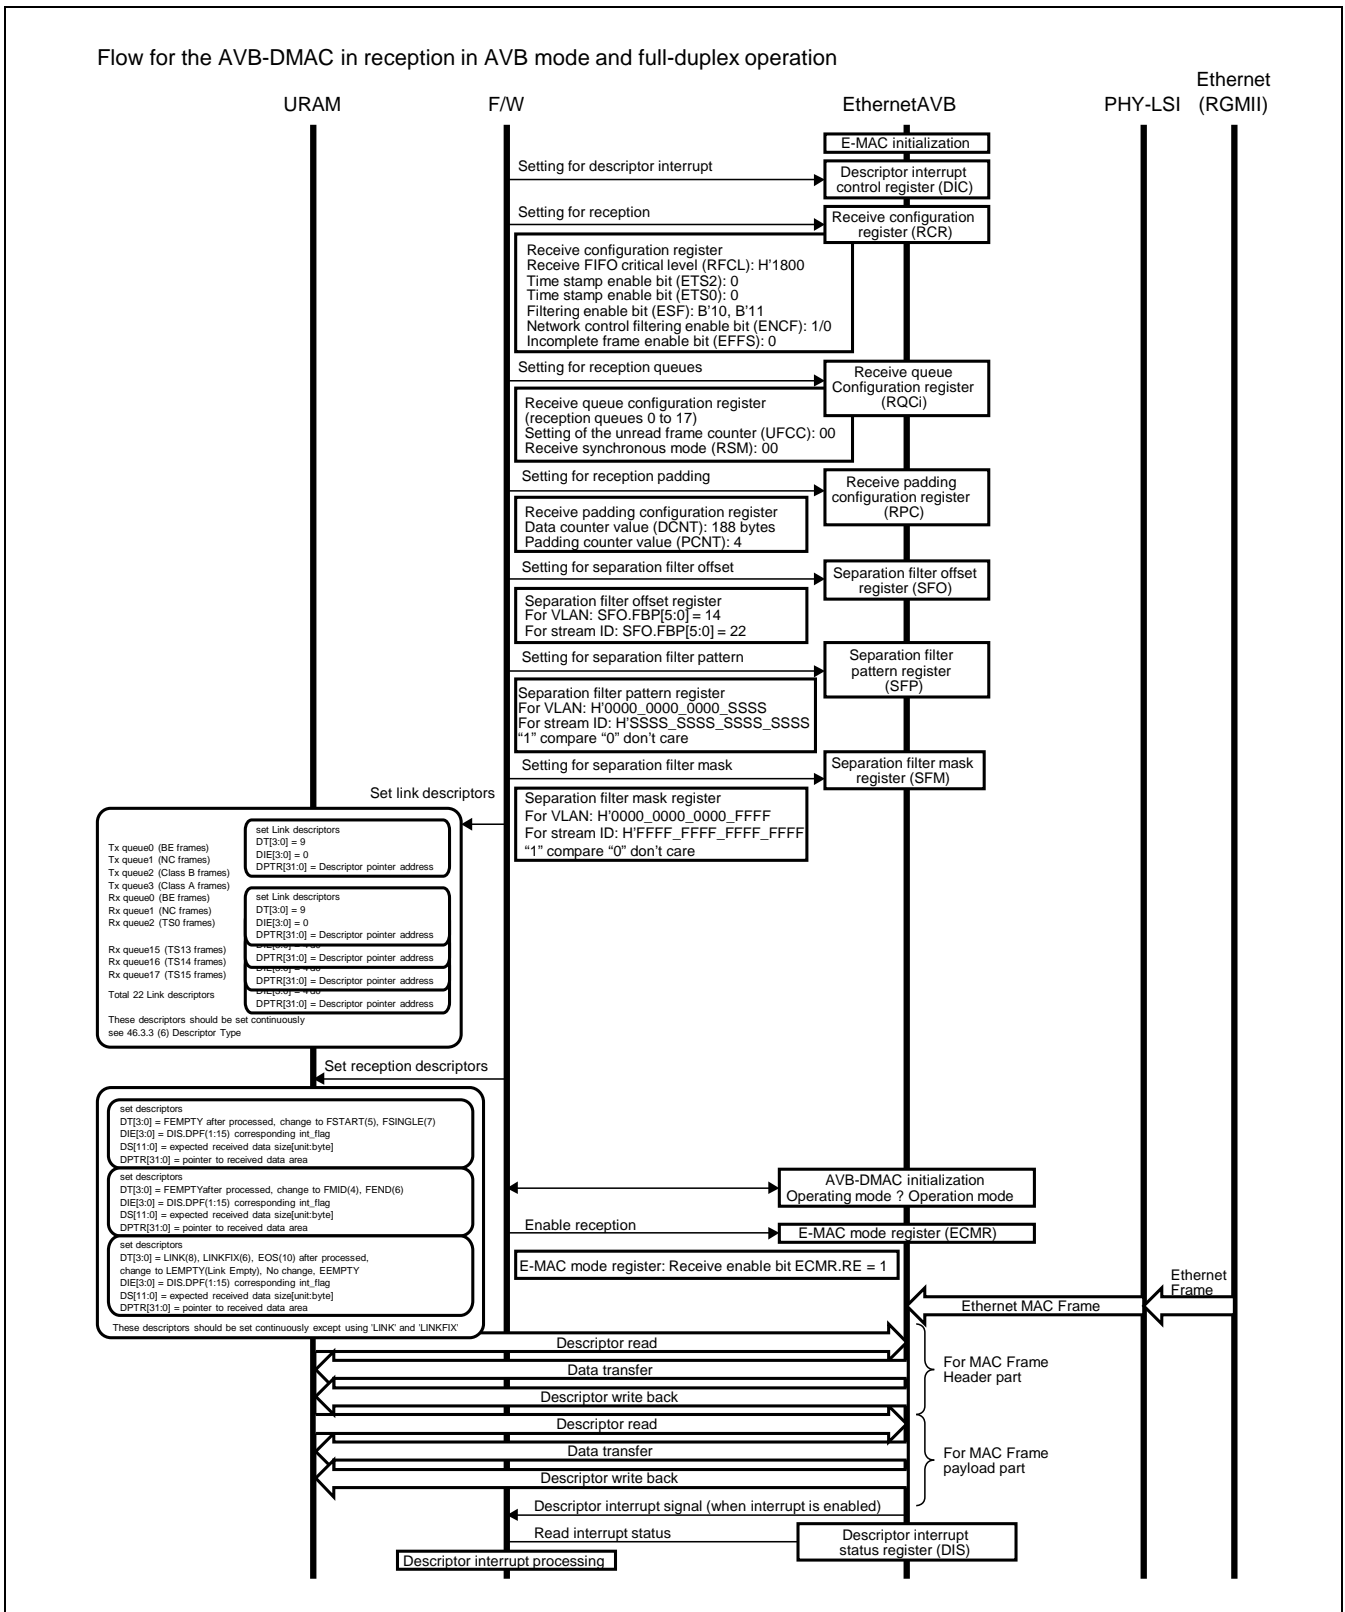

Figure 46.63 Flow for the AVB-DMAC in Reception (in AVB Mode and Full-Duplex Operation)

(4) Flow for the AVB-DMAC in Transmission

Figure 46.64 shows the flow for the AVB-DMAC in transmission (in AVB mode and full-duplex operation).

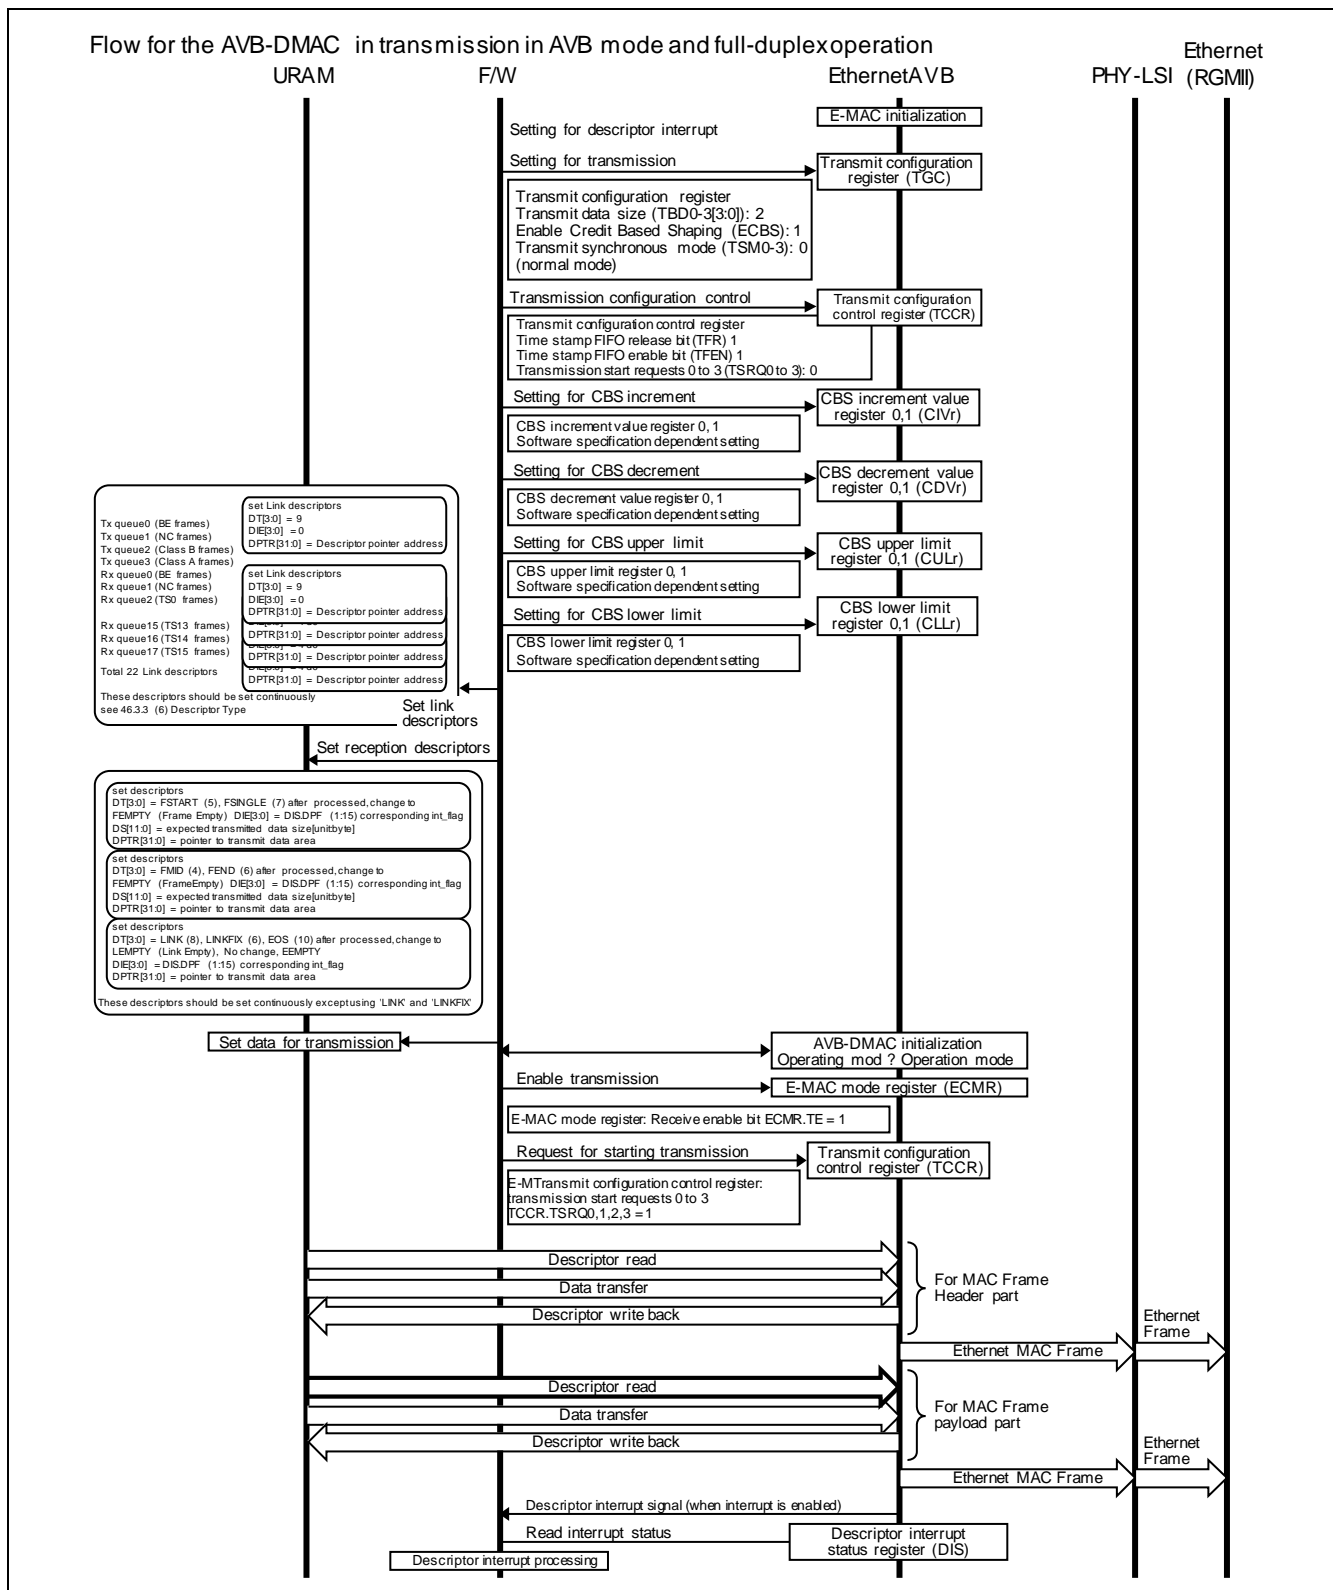

Figure 46.64 Flow for the AVB-DMAC in Transmission (in AVB Mode and Full-Duplex Operation)

(5) Flow for Stopping AVB-DMAC Operation in Reception

Figure 46.65 shows the flow for stopping AVB-DMAC operation in reception (normal, common to all modes).

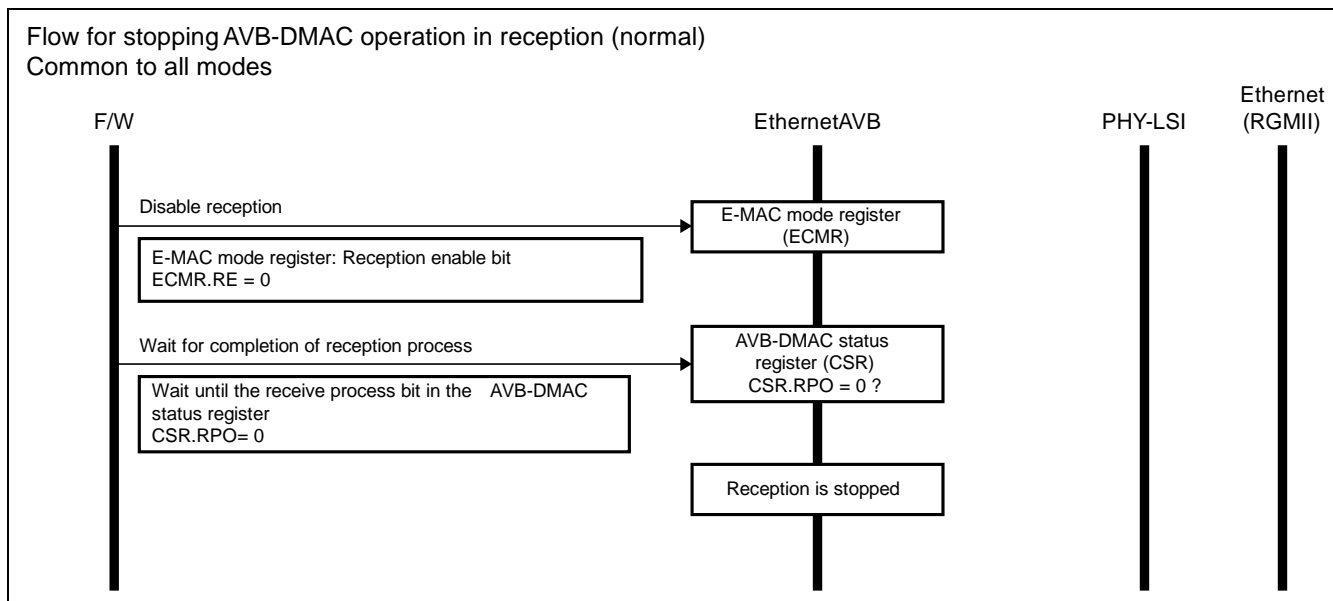

Figure 46.65 Flow for Stopping AVB-DMAC Operation in Reception (Normal, Common to All Modes)

(6) Flow for Stopping AVB-DMAC Operation in Transmission

Figure 46.66 shows the flow for stopping AVB-DMAC operation in transmission (normal, common to all modes).

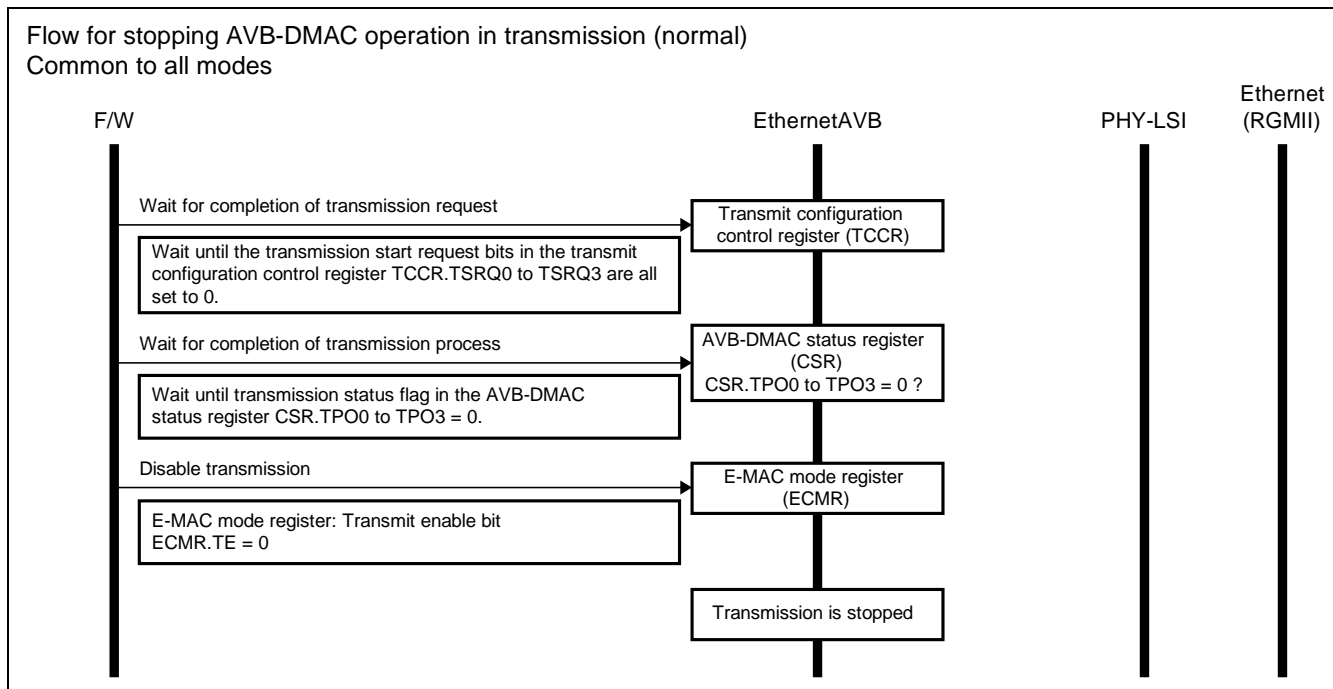

Figure 46.66 Flow for Stopping AVB-DMAC Operation in Transmission (Normal, Common to All Modes)

(7) Flow for Stopping and Resetting the AVB-DMAC

Figure 46.67 shows the flow for stopping and resetting the AVB-DMAC (normal, common to all modes).

Figure 46.67 Flow for Stopping and Resetting the AVB-DMAC (Normal, Common to All Modes)

(8) Flow for Emergency Stopping the AVB-DMAC

Figure 46.68 shows the flow for emergency stopping the AVB-DMAC (normal, common to all modes).

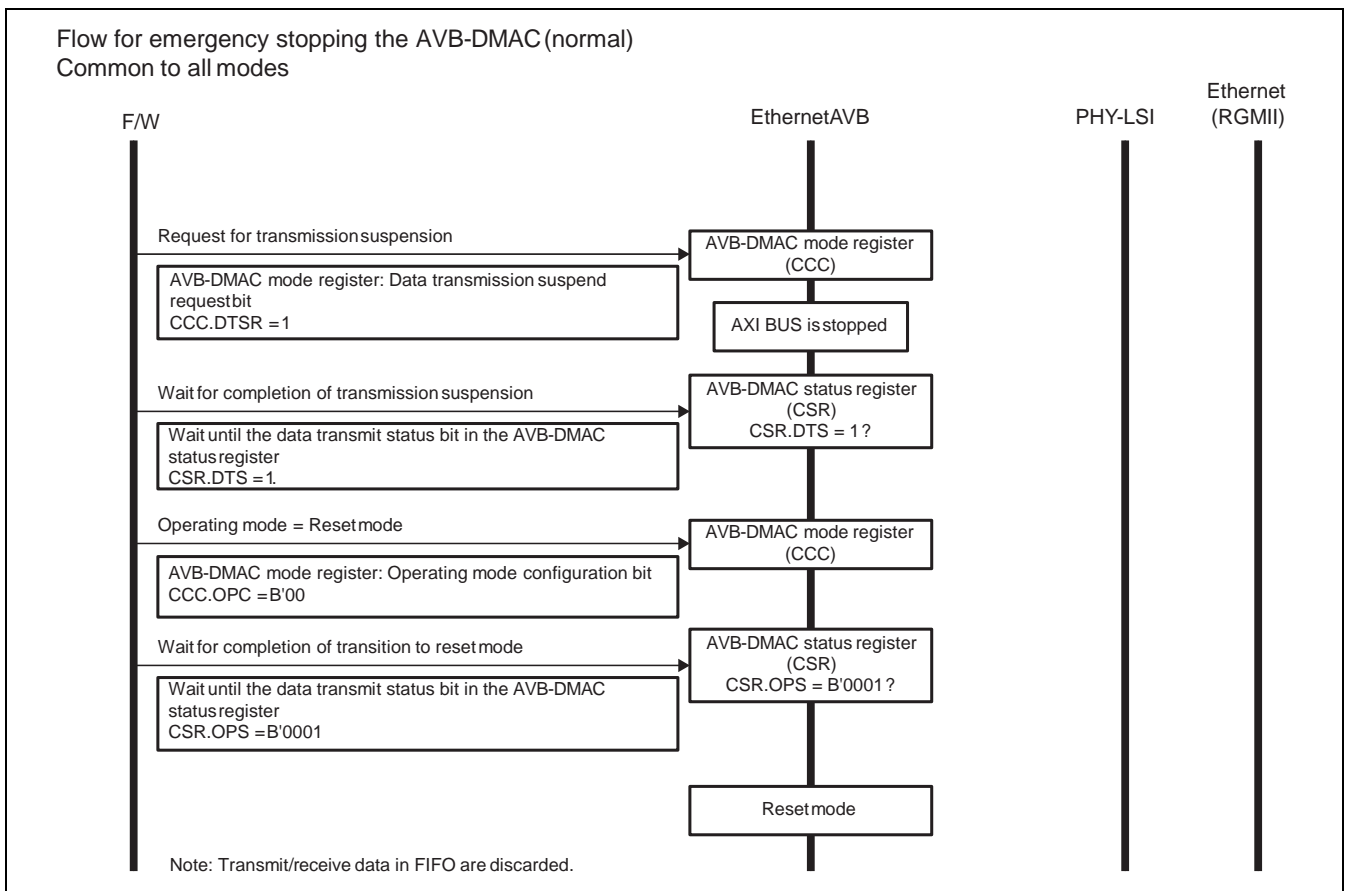

Figure 46.68 Flow for Emergency Stopping the AVB-DMAC (Normal, Common to All Modes)

(9) Flow of gPTP Initialization

Figure 46.69 shows the flow of gPTP initialization (normal, common to all modes).

Figure 46.69 Flow of gPTP Initialization (Normal, Common to All Modes)

(10) Flow of gPTP Time Stamping in Transmission

Figure 46.70 shows the flow of gPTP time stamping in transmission (normal, common to all modes).

Figure 46.70 Flow of gPTP Time Stamping in Transmission (Normal, Common to All Modes)

(11) Flow of gPTP Time Stamping and Synchronization in Reception

Figure 46.71 shows the flow of gPTP time stamping and synchronization in reception (normal, common to all modes).

Figure 46.71 Flow of gPTP Time Stamping and Synchronization in Reception (Normal, Common to All Modes)

(12) Flow of Capturing gPTP Presentation Times

Figure 46.72 shows the flow of capturing gPTP presentation times (common to all modes).

Figure 46.80 RGMII Frame Receive Timing (Carrier Extend)

Figure 46.81 RGMII Frame Receive Timing (Carrier Extend Error)

Figure 46.82 RGMII Frame Receive Timing (Carrier Sense)

(2) Accessing MII Management Registers

MII management registers in the PHY-LSI are accessed via PIR in this LSI. PIR is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

(a) MII Management Frame Format

Figure 46.83 shows the format of an MII management frame. To access an MII management register, a management frame is implemented by the program in accordance with the procedures shown in MII Management Register Access Procedure.

| Access Type | MII Management Frame | | | | | | | |
|----------------|----------------------|----|----|-------|-------|----|-------|------|
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | |
| Read | 1..1 | 01 | 10 | 00001 | RRRRR | Z0 | D...D | |
| Write | 1..1 | 01 | 01 | 00001 | RRRRR | 10 | D...D | X |

[Legend]

PRE: 32 consecutive 1 s

ST: Write of B'01 indicating start of frame

OP: Write of code indicating access type

PHYAD: Write of B'0_0001 if the PHY-LSI address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI address.

REGAD: Write of B'000q if the register address is 1 (sequential write starting with the MSB).
This bit changes depending on the PHY-LSI register address.

TA: Time for switching data transmission source on MII interface
(a) Write: 10 written

(b) Read: Bus release (notation: Z0) performed

DATA: 16-bit data. Sequential write or read from MSB

(c) Write: 16-bit data write

(d) Read: 16-bit data read

IDLE: Wait time until next MII management format input

(a) Write: Independent bus release (notation: X) performed

(b) Read: Bus already released in TA: control unnecessary

Figure 46.83 MII Management Frame Format

(b) MII Management Register Access Procedure

The program accesses MII management registers via PIR. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. Figure 46.84 to Figure 46.87 show the MII management register timing. The timing will differ depending on the PHY-LSI type.

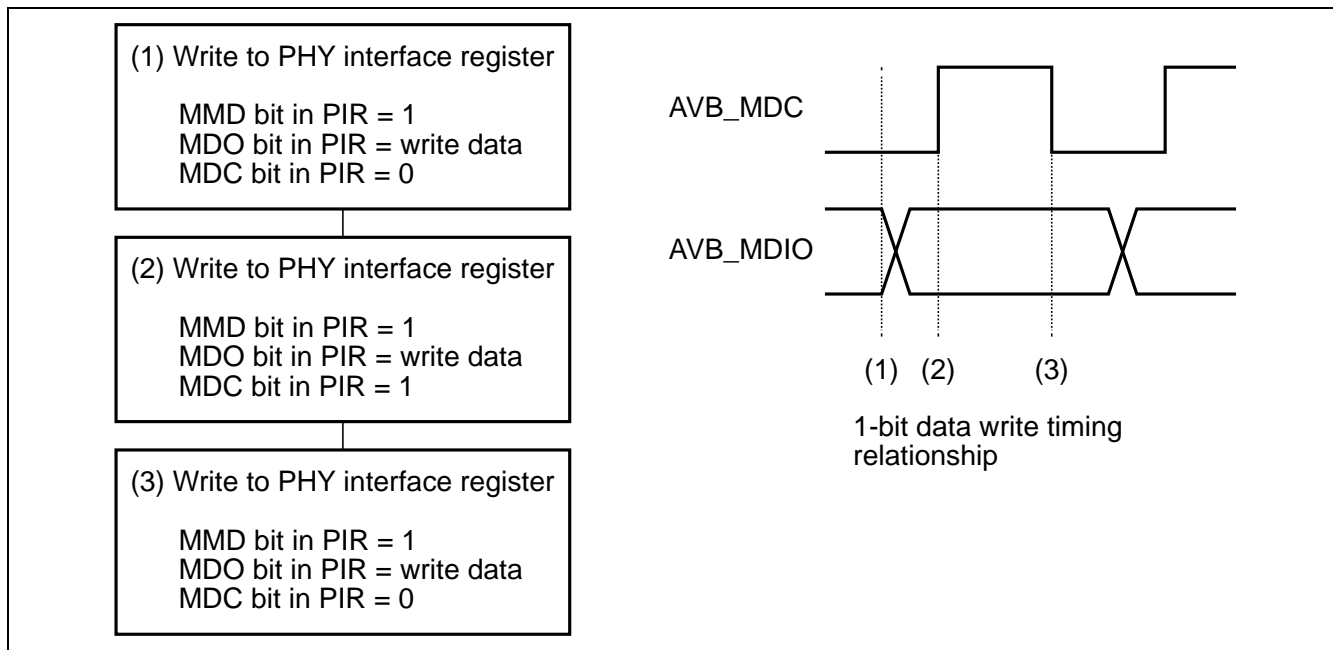

Figure 46.84 1-Bit Data Write Flowchart

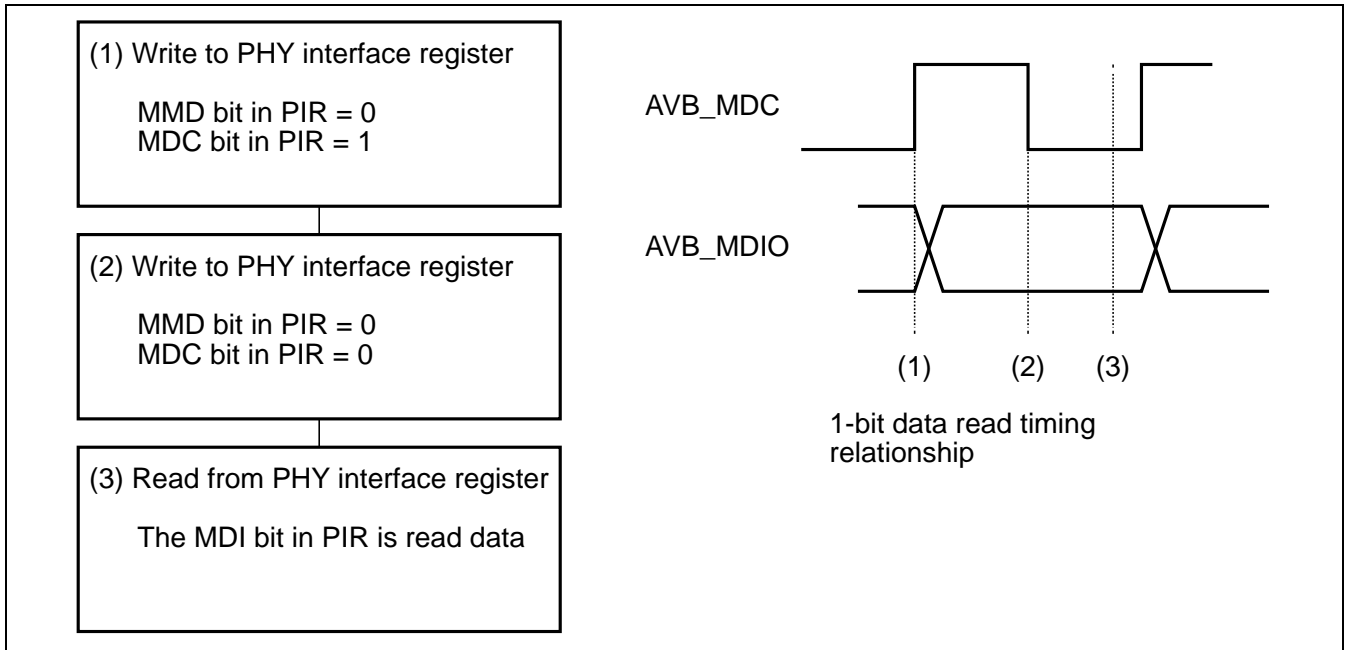

Figure 46.86 1-Bit Data Read Flowchart

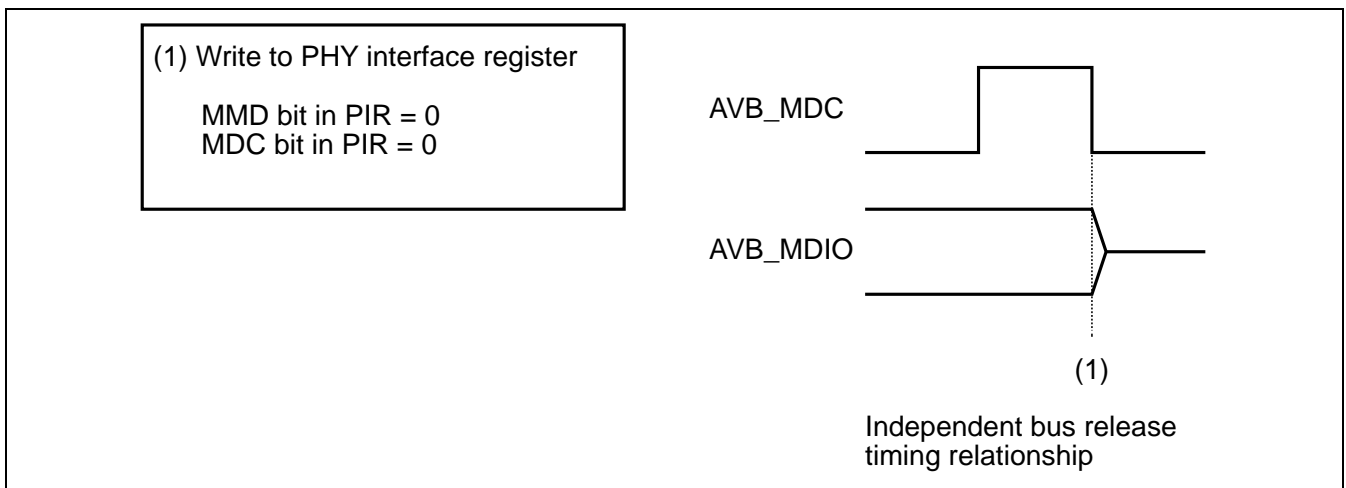

Figure 46.87 Independent Bus Release Flowchart (IDLE in Write in Figure 46.83)

46.3.14 Usage Notes

(a) Reception is Ignored when AVB_RX_CTL indicates an error from PHY is Flagged at 1st Data Byte

The issue is limited to reception of frames with physical faults. Flagging of occurrence in SFR is missing. When EthernetAVB-IF is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS there is no storage.

(b) Unexpected Data are Exported when AVB_RX_CTL indicates an error is Flagged at 8th Data Byte

The issue is limited to reception of frames with physical faults.

Flagging of occurrence in SFR is invalid. When EthernetAVB-IF is configured to store faulty frames in reception queue 0 (BE) by RCR.EFFS corrupted data is stored and MAC status code is wrong.

(c) Receive Frame Interrupt and Descriptor Interrupt may be Issued before Completion of Writing Data

When receive frame interrupt and descriptor interrupt are issued, whether writing data is completed by DESCR.DT in a descriptor can be confirmed.

And CDARq register has the descriptor address which EthernetAVB-IF is processing currently or is going to process at the next time.

The descriptors before one indicated by CDARq register are scope for receive frame interrupt and descriptor interrupt scope.

If there is a descriptor which wait for HW processing (ex. FEMPTY), it's delayed. Confirm the descriptor again after waiting for 1ms.

46.4 Usage Notes

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

46.4.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to checksum calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Figure 46.88 shows schematics indicating which parts of the Ethernet frames are calculated. Calculation involves 16-bit addition only; it does not involve bit inversion. Note that when the checksum data is valid, the CRC data (4 bytes) is not transferred as a receive frame, and the checksum data (sum data) is added automatically. Figure 46.89 shows schematics of Ethernet frames to which the checksum data has been added.

Note: Also for the frames with VLANtag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

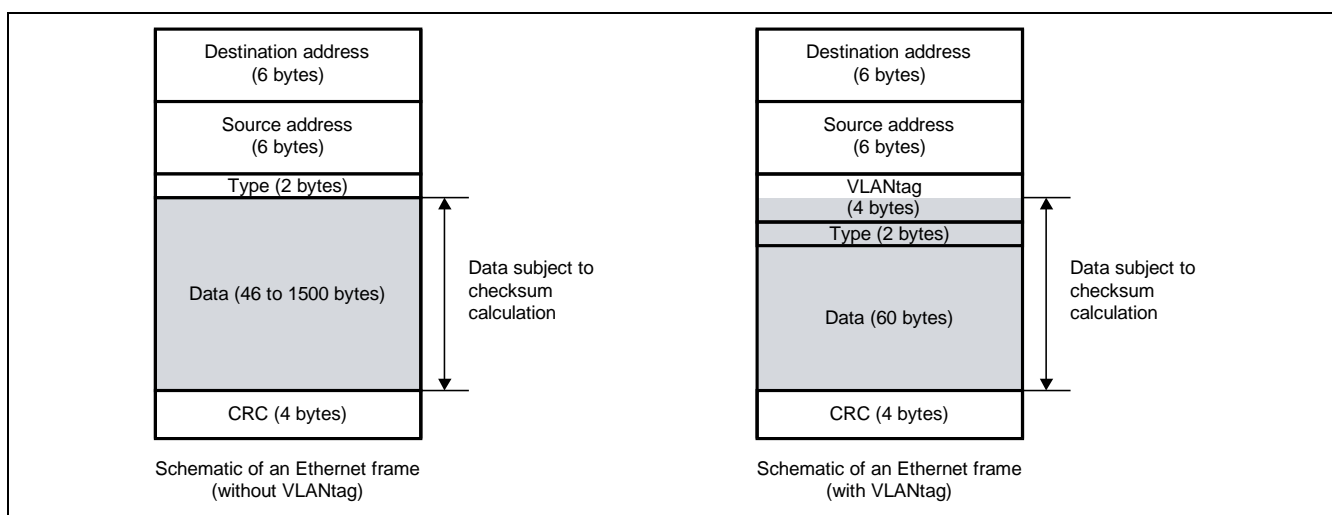

Figure 46.88 Data Subject to Checksum Calculation

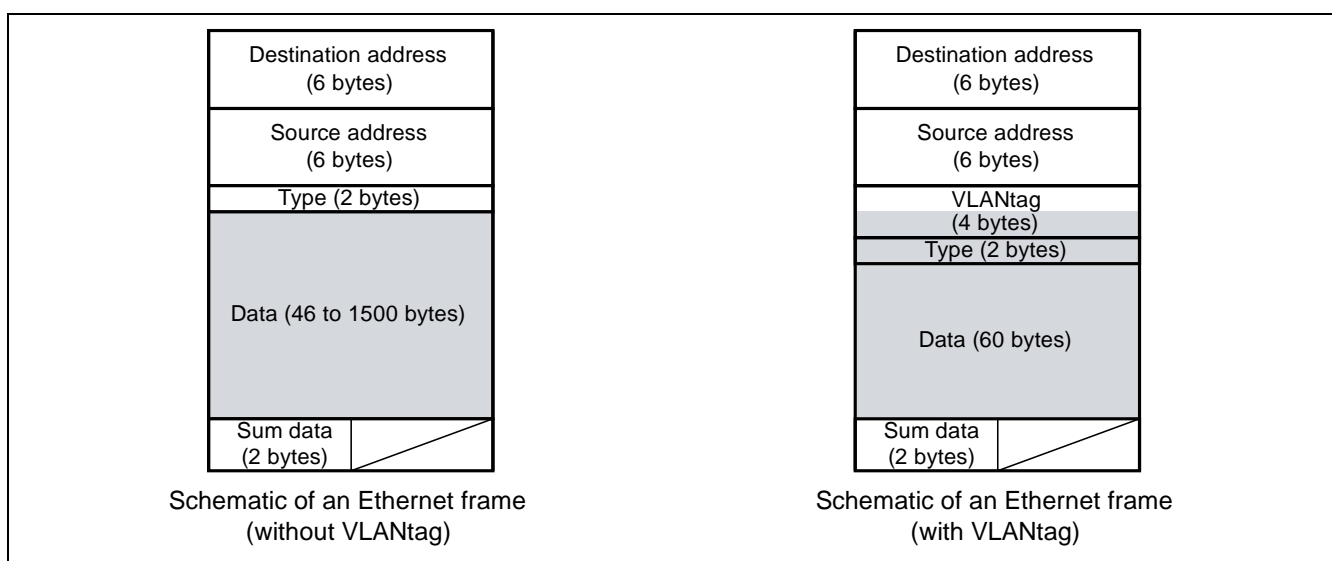

Figure 46.89 Data after Checksum Data Addition

46.4.2 Data Transfer Function Stops after Read Access Error

If EthernetAVB-IF gets an access error when reading from work RAM, it may happen that no further work RAM accesses are issued. So transfer of receive/transmit frames is halted. By using the data transfer suspend function SW can observe if data transfer function is available or not.

Perform one of given SW flows which are triggered by this start condition: when AXI read access error has been flagged by EIS.QEF is 1, and ESR.ET is B'0000 or B'0100; additionally when ESR.EIL is 1 (this is an indication that an work RAM read error may be lost).

There are two possible SW flows given. Figure 46.90 applies always the SW reset, independently if this is required or not. Figure 46.91 checks in addition if SW reset is required; checking CSR.DTS after wait gives an indication that issue has been occurred.

Note that the wait after write of CCC.DTSR is mandatory to prevent cases where issue has not been occurred.

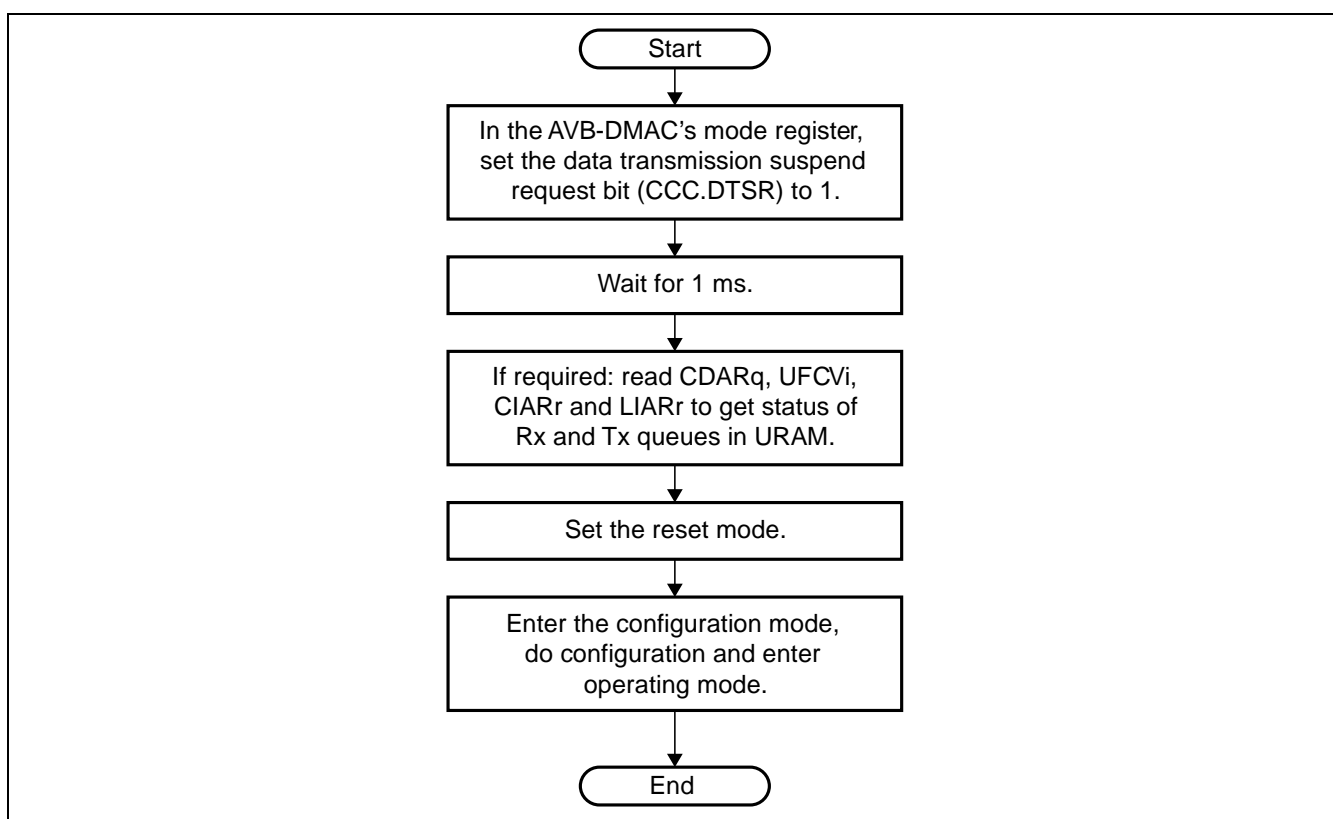

Figure 46.90 Data Transfer Function Stop Flow1 after Read Access Error

Figure 46.91 Data Transfer Function Stop Flow2 after Read Access Error

46.4.3 Power Down Request

If EthernetAVB-IF gets a power down request while writing to work RAM, it may happen that the request is not accepted even if the transfer is completed. Due to this the external power down module cannot complete the power down sequence.

A power down request is acceptable only when EthernetAVB-IF is in RESET state.

47. Controller Area Network Interface (CAN interface)

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

47.1 Overview

47.1.1 Features

This MCU implements two channels (referred to as CAN0 and CAN1) of CAN (Controller Area Network) module that complies with the ISO11898-1 Specifications. The CAN module transmits and receives both formats of messages, namely the standard identifier (11 bits) (identifier hereafter referred to as ID) and extended ID (29 bits). Table 47.1 lists the CAN module overview and figure 47.1 shows the CAN module block diagram. Connect the CAN bus transceiver externally.

Table 47.1 CAN module overview

| Item | Overview |

47.1.2 Block Diagram

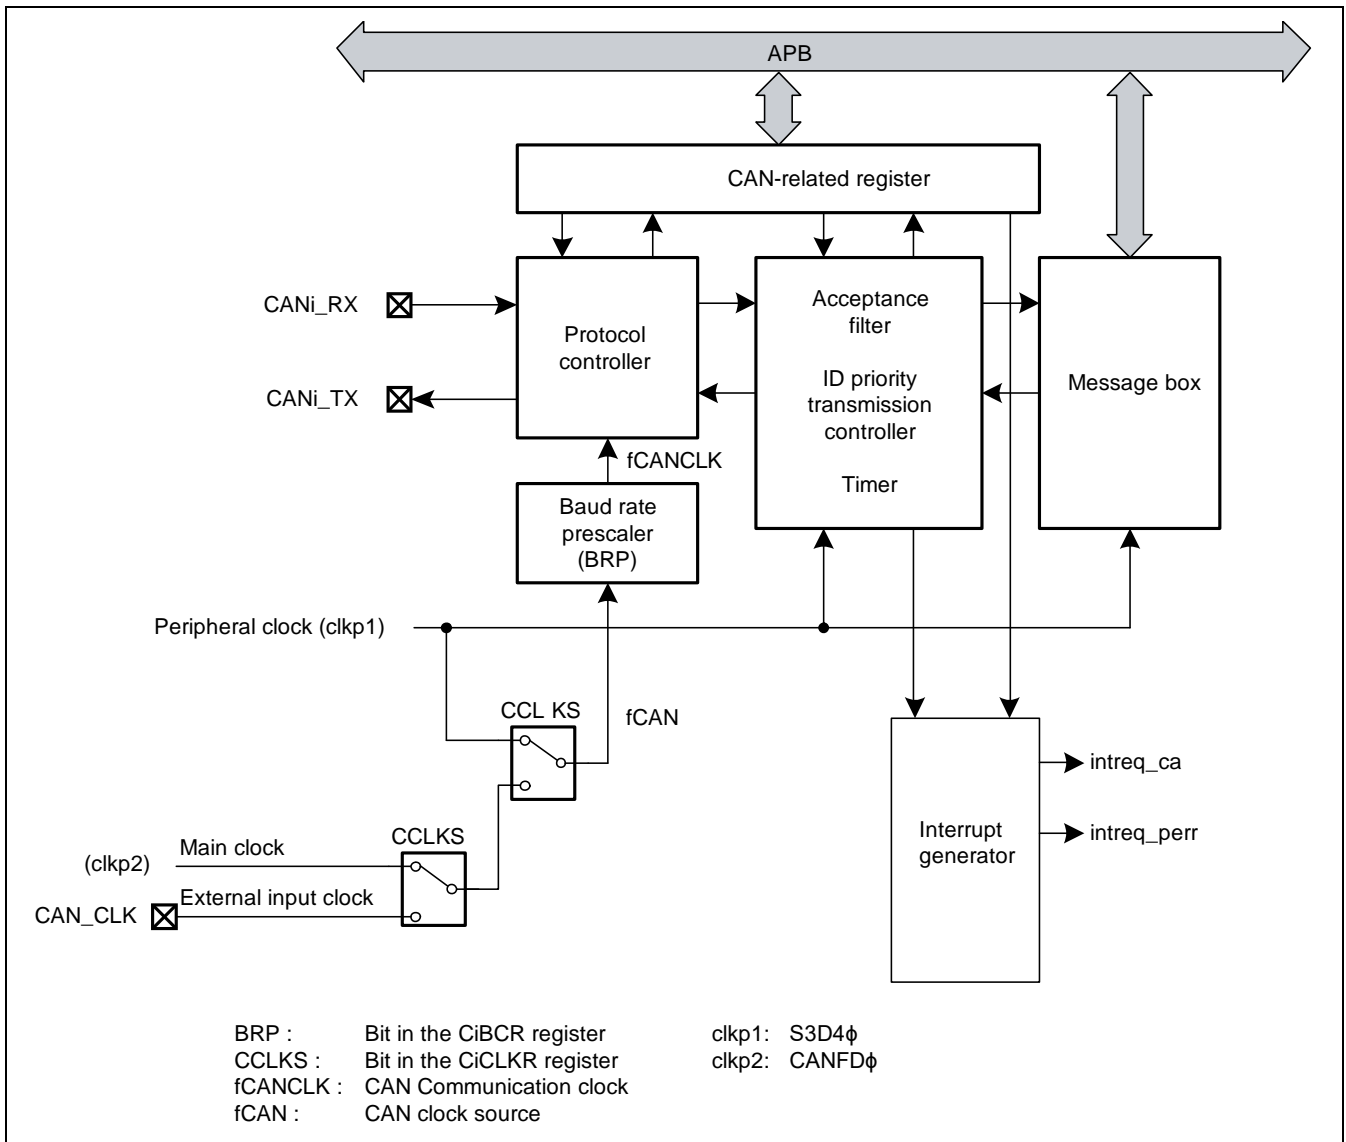

Figure 47.1 Block Diagram of CAN Module (i = 0, 1)

- CANi_RX/CANi_TX (i = 0 and 1):
CAN input/output pins
- Protocol controller:
Handles CAN protocol processing such as bus arbitration, bit timing at transmission and reception, stuffing, and error handling, etc.
- Message box:
Consists of 64 mailboxes which can be configured as either transmit or receive mailboxes. Each mailbox has an individual ID, data length code, a data field (8 bytes), and a time stamp.
- Acceptance filter:
Performs filtering of received messages. Registers CiMKR0 to CiMKR9 are used for the filtering process.
- Timer:
Used for the time stamp function. The timer value when storing a message into the mailbox is written as the time stamp value.
- Interrupt generator:
Generates the following five types of interrupts:
CANi reception complete interrupt
CANi transmission complete interrupt
CANi receive FIFO interrupt
CANi transmit FIFO interrupt
CANi error interrupt
- Support parity error detection as safety mechanism function

47.1.3 External Pins

Table 47.2 shows the CAN module pin.

Pin switching is required for pins which are multiplexed with other functions. For details, see section 6, Pin Function Controller (PFC).

47.2 Register Description

Legend:

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

R/WC0: Readable/writable. Writing 0 initializes the bit. Writing 1 is ignored.

R: Read-only. When writing to the register, read out the value of these bits and write it back without alteration.

W: Write-only. The read value is undefined.

<After Reset: H'0500>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13 | RBOC | B'0 | R/W | Forcible Return From Bus-OFF Bit*1 When the RBOC bit is set to "1" (forcible return from bus-off) in bus-off state, the CAN module forcibly returns from the bus-off state. This bit is automatically set to 0. The error state changes from bus-off to error-active. When the RBOC bit is set to "1", registers CiRECR and CiTECR are set to "H'00" and the BOST bit in the CiSTR register is set to "0" (the CAN module is not in bus-off state). The other registers remain unchanged. No bus-off recovery interrupt request is generated by this recovery from the bus-off state. Use the RBOC bit only when the BOM bit = "00" (normal mode). 0: Nothing occurred 1: Forcible return from bus-off*2 |

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 12, 11 | BOM | All 0 | R/W | <p>Bus-Off Recovery Mode Bit*3</p> <p>The BOM bit is used to select bus-off recovery mode.</p> <p>When the BOM bit is "B'00", the recovery from bus-off is compliant with ISO11898-1, i.e. the CAN module re-enters CAN communication (error-active state) after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request is generated when recovering from bus-off.</p> <p>When the BOM bit is "B'01", as soon as the CAN reaches the bus-off state, the CANM bit in the CiCTRL register is set to "B'10" (CAN halt mode) and the CAN enters CAN halt mode. No bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00".</p> <p>When the BOM bit is "B'10", the CANM bit is set to B'10 as soon as the CAN module reaches the bus-off state. The CAN module enters CAN halt mode after the recovery from the bus-off state, i.e. after detecting 11 consecutive recessive bits 128 times. A bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00".</p> <p>When the BOM bit is "B'11", the CAN module enters CAN halt mode by setting the CANM bit to "B'10" while the CAN module is still in bus-off state. No bus-off recovery interrupt request is generated when recovering from bus-off and registers CiTECR and CiRECR are set to "H'00". However, if the CAN module recovers from bus-off after detecting 11 consecutive recessive bits 128 times before the CANM bit is set to "B'10", a bus-off recovery interrupt request is generated.</p> <p>If the CPU requests an entry to CAN reset mode at the same time as the CAN module attempts to enter CAN halt mode (at bus-off entry when the BOM bit is "B'01", or at bus-off end when the BOM bit is "B'10"), then the CPU request to enter CAN reset mode has higher priority.</p> <p>B'00: Normal mode (ISO11898-1 compliant) B'01: Entry to CAN halt mode automatically at bus-off entry B'10: Entry to CAN halt mode automatically at bus-off end B'11: Entry to CAN halt mode (during bus-off recovery period) by a program request</p> |
| 10 | SLPM | B'1 | R/W | <p>CAN Sleep Mode Bit*4*5</p> <p>When the SLPM bit is set to "1", the CAN module enters CAN sleep mode.</p> <p>When the SLPM bit is set to "0", the CAN module exits CAN sleep mode. Refer to section 47.3, Operating Mode for detail.</p> <p>0: Other than CAN sleep mode 1: CAN sleep mode</p> |
| 9, 8 | CANM | B'01 | R/W | <p>CAN Operating Mode Select Bit*4</p> <p>The CANM bit selects one of the following modes for the CAN module: CAN operation mode, CAN reset mode or CAN halt mode. Refer to section 47.3, Operating Mode for detail. CAN sleep mode is set by the SLPM bit.</p> <p>When the CAN module enters CAN halt mode according to the setting of the BOM bit, the CANM bit is automatically set to "10".</p> <p>B'00: CAN operation mode B'01: CAN reset mode B'10: CAN halt mode B'11: CAN reset mode (forcible transition)</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|------|--------|---------------|-----|--|
| 7, 6 | TSPS | All 0 | R/W | <p>Time Stamp Prescaler Select Bit*³</p> <p>The TSPS bit selects the prescaler for the time stamp. The reference clock for the time stamp can be selected to be either 1-, 2-, 4- or 8-bit time periods.</p> <p>B'00: Every bit time B'01: Every 2-bit time B'10: Every 4-bit time B'11: Every 8-bit time</p> |
| 5 | TSRC | B'0 | R/W | <p>Time Stamp Counter Reset Command Bit*⁶</p> <p>The TSRC bit is used to reset the time stamp counter. When the TSRC bit is set to "1", the CiTSR register is set to H'0000. It is automatically set to 0.</p> <p>0: Nothing occurred 1: Reset*²</p> |
| 4 | TPM | B'0 | R/W | <p>Transmission Priority Mode Select Bit*³</p> <p>The TPM bit specifies the priority of modes when transmitting messages. ID priority transmit mode or mailbox number transmit mode can be selected.</p> <p>All mailboxes are set for either ID priority transmission or mailbox number priority transmission.</p> <p>When the TPM bit is 0, ID priority transmit mode is selected and transmission priority complies with the CAN bus arbitration rule, as defined in the ISO 11898-1 Specifications. In ID priority transmit mode, mailboxes [0] to [63] (in normal mailbox mode), and mailboxes [0] to [55] (in FIFO mailbox mode), and the transmit FIFO are compared for the IDs of mailboxes configured for transmission. If two or more mailbox IDs are the same, the mailbox with the smaller number has higher priority.</p> <p>Only the next message to be transmitted from the transmit FIFO is included in the transmission arbitration. If a transmit FIFO message is being transmitted, the next pending message within the transmit FIFO is included in the transmission arbitration.</p> <p>When the TPM bit is 1, mailbox number transmit mode is selected and the transmit mailbox with the smallest mailbox number has the highest priority. In FIFO mailbox mode, the transmit FIFO has lower priority than normal mailboxes (mailboxes [0] to [55]).</p> <p>0: ID priority transmit mode 1: Mailbox number priority transmit mode</p> |
| 3 | MLM | B'0 | R/W | <p>Message Lost Mode Select Bit*³</p> <p>The MLM bit specifies the operation when a new message is captured in the unread mailbox.</p> <p>Overwrite mode or overrun mode can be selected. All mailboxes (including the receive FIFO) are set to either overwrite mode or overrun mode.</p> <p>When the MLM bit is "0", all mailboxes are set to overwrite mode and the new message is overwriting the old message.</p> <p>When this bit is "1", all mailboxes are set to overrun mode and the new message is discarded.</p> <p>0: Overwrite mode 1: Overrun mode</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|------|--------|---------------|-----|--|
| 2, 1 | IDFM | All 0 | R/W | <p>ID Format Mode Select Bit*³</p> <p>The IDFM bit specifies the ID format.</p> <p>B'00: Standard ID mode All mailboxes (including FIFO mailboxes) handle only standard IDs.</p> <p>B'01: Extended ID mode All mailboxes (including FIFO mailboxes) handle only extended IDs.</p> <p>B'10: Mixed ID mode All mailboxes (including FIFO mailboxes) handle both standard IDs and extended IDs. Standard IDs or extended IDs are specified by using the IDE bit in the corresponding mailbox in normal mail box mode. In FIFO mailbox mode, the IDE bit in the corresponding mailbox is used for mailboxes [0] to [55], the IDE bit in registers CiFIDCR0 and CiFIDCR1 is used for the receive FIFO, and the IDE bit in mailbox [56] is used for the transmit FIFO.</p> <p>B'11: Do not use this combination</p> |
| 0 | MBM | B'0 | R/W | <p>CAN Mailbox Mode Select Bit*³</p> <p>When the MBM bit is "0" (normal mailbox mode), mailboxes [0] to [63] are configured as transmit or receive mailboxes. When the MBM bit is "1" (FIFO mailbox mode), mailboxes [0] to [55] are configured as transmit or receive mailboxes. Mailboxes [56] to [59] are configured as a transmit FIFO and mailboxes [60] to [63] as a receive FIFO.</p> <p>Transmit data is written into mailbox [56] (mailbox [56] is a window mailbox for the transmit FIFO).</p> <p>Receive data is read from mailbox [60] (mailbox [60] is a window mailbox for the receive FIFO).</p> <p>Table 47.5 lists the Mailbox Configuration.</p> <p>0: Normal mailbox mode 1: FIFO mailbox mode</p> |

- Notes:
1. Set the RBOC bit to "1" in bus-off state.
 2. Bits RBOC and TSRC are automatically set back to "0" after being set to "1". It should be read as "0".
 3. Write to bits BOM, MBM, IDFM, MLM,, TPM, and TSPS in CAN reset mode.
 4. When bits CANM and SLPM are changed, check the CiSTR register to ensure that the mode has been switched.
 5. Write to the SLPM bit in CAN reset mode or CAN halt mode. When rewriting the SLPM bit, set only this bit to "0" or "1".
 6. Set the TSRC bit to "1" in CAN operation mode.

Table 47.5 Mailbox Configuration

| Mailbox | MBM Bit = "0" (Normal mailbox mode) | MBM Bit = "1" (FIFO mailbox mode) |
|------------------------|-------------------------------------|-----------------------------------|
| Mailboxes [0] to [55] | Normal mailbox | Normal mailbox |
| Mailboxes [56] to [59] | | Transmit FIFO |
| Mailboxes [60] to [63] | | Receive FIFO |

Notes: Points 1 to 5 below should be considered when the MBM bit is set to "1".

1. Transmit FIFO is controlled by the CiTFCR register.
The CiMCTLj register of mailboxes [56] to [59] are disabled.
Registers CiMCTL56 to CiMCTL59 cannot be used.
2. Receive FIFO is controlled by the CiRFCR register.
The CiMCTLj register of mailboxes [60] to [63] are disabled.
Registers CiMCTL60 to CiMCTL63 cannot be used.
3. Refer to the CiMIER1 register about the FIFO interrupts.
4. The corresponding bits in the CiMKIVLR register for mailboxes [56] to [63] are disabled. Set 0 to these bits.
5. Transmit/receive FIFOs can be used for both data frames and remote frames.

47.2.2 CANi Clock Select Register (CiCLKR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

CAN0 Clock Select Register (C0CLKR)

CAN1 Clock Select Register (C1CLKR)

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 7 to 2 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 1, 0 | CCLKS | B'00 | R/W | CAN Clock Source Select Bits* The CCLKS bits select clock source from among the peripheral clock (clkp1 or clkp2) generated by the PLL frequency synthesizer, and an externally input clock. B'00: Peripheral clock (clkp1) B'01: Peripheral clock (clkp2) B'10: Illegal value B'11: Externally input clock |

Note: * Write to the CCLKS bit in CAN reset mode.

47.2.3 CANi Bit Configuration Register (CiBCR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

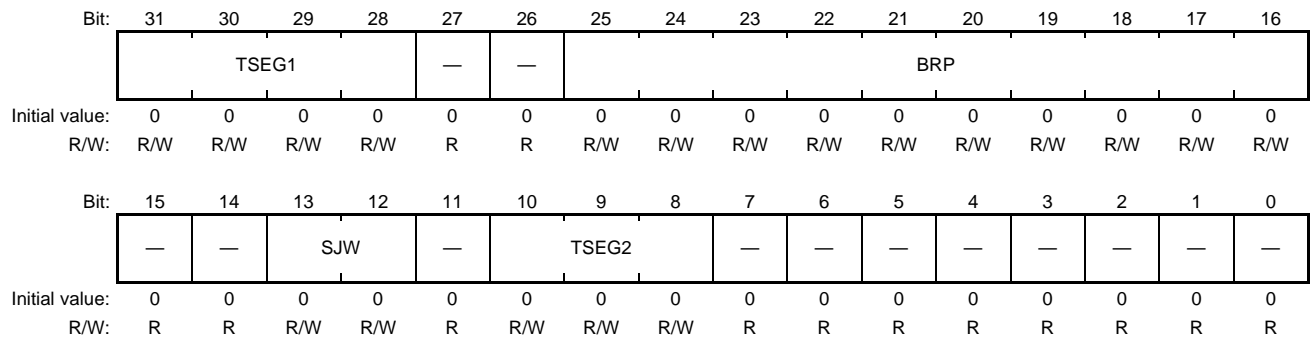

For the bit timing configuration rule, refer to section 47.4, CAN Communication Speed Configuration.

Set the CiBCR register before entering CAN halt mode from CAN reset mode or CAN operation mode from CAN reset mode. After the setting is made once, this register can be written to in CAN reset mode or CAN halt mode.

The CiBCR register consists of 24 bits. A 32-bit read/write access should be performed carefully not to rewrite the CiCLKR register.

CAN0 Bit Configuration Register (C0BCR)

CAN1 Bit Configuration Register (C1BCR)

<After Reset: H'0000_0000>

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|--|
| 31 to 28 | TSEG1 | All 0 | R/W | <p>Time Segment 1 Control Bits</p> <p>The TSEG1 bit is used to specify the total length of the propagation time segment (PROP_SEG) and phase buffer segment 1 (PHASE_SEG1) with the value of Tq.</p> <p>A value from 4 to 16 time quanta can be set.</p> <p>B'0000: Do not use this combination</p> <p>B'0001: Do not use this combination</p> <p>B'0010: Do not use this combination</p> <p>B'0011: 4 Tq</p> <p>B'0100: 5 Tq</p> <p>B'0101: 6 Tq</p> <p>B'0110: 7 Tq</p> <p>B'0111: 8 Tq</p> <p>B'1000: 9 Tq</p> <p>B'1001: 10 Tq</p> <p>B'1010: 11 Tq</p> <p>B'1011: 12 Tq</p> <p>B'1100: 13 Tq</p> <p>B'1101: 14 Tq</p> <p>B'1110: 15 Tq</p> <p>B'1111: 16 Tq</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|--|
| 27, 26 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 25 to 16 | BRP | All 0 | R/W | Prescaler Division Ratio Set Bits The BRP bit is used to set the peripheral bus clock periods contained in a Time Quantum. If the setting value is P (0 to 1023), the baud rate prescaler divides fCAN by P + 1. |
| 15, 14 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 13, 12 | SJW | All 0 | R/W | Resynchronization Jump Width Control Bits The SJW bit is used to specify the resynchronization jump width with the value of Tq. A value from 1 to 4 time quanta can be set. Set the value smaller than or equal to that of the TSEG2 bit. B'00: 1 Tq B'01: 2 Tq B'10: 3 Tq B'11: 4 Tq |
| 11 | — | B'0 | R | Reserved bit This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit. |
| 10 to 8 | TSEG2 | All 0 | R/W | Time Segment 2 Control Bits The TSEG2 bit is used to specify the length of phase buffer segment 2 (PHASE_SEG2) with the value of Tq. A value from 2 to 8 time quanta can be set. Set the value smaller than that of the TSEG1 bit. B'000: Do not use this combination B'001: 2 Tq B'010: 3 Tq B'011: 4 Tq B'100: 5 Tq B'101: 6 Tq B'110: 7 Tq B'111: 8 Tq |
| 7 to 0 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

47.2.4 CANi Mask Register k (CiMKRk) (i = 0, 1; k = 0 to 9)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

For masking the function in FIFO mailbox mode, refer to section 47.6, Acceptance Filtering and Masking Function.

Write to registers CiMKR0 to CiMKR9 in CAN reset mode or CAN halt mode.

CAN0 Mask Register 0 (C0MKR0)

CAN0 Mask Register 1 (C0MKR1)

CAN0 Mask Register 2 (C0MKR2)

:

CAN0 Mask Register 9 (C0MKR9)

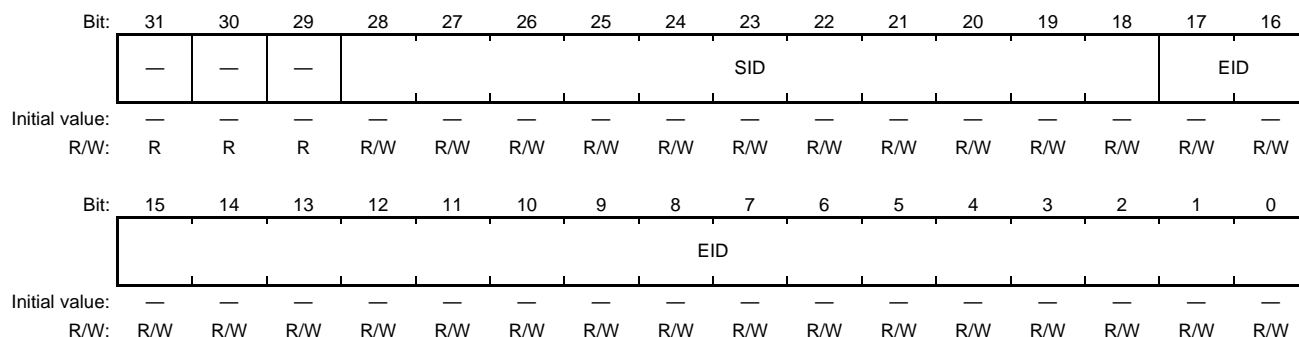

CAN1 Mask Register 0 (C1MKR0)

CAN1 Mask Register 1 (C1MKR1)

CAN1 Mask Register 2 (C1MKR2)

:

CAN1 Mask Register 9 (C1MKR9)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|---|
| 31 to 29 | — | Undefined | R | Reserved bits The reset value is undefined. The write value should be "0". These bits are read as "0" after "0" is written to. |

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|--|
| 28 to 18 | SID | Undefined | R/W | <p>Standard ID Bits</p> <p>The SID bit is the filter mask bit corresponding to the CAN standard ID bit. The SID bit is used to receive both standard ID and extended ID messages.</p> <p>When the SID bit is set to "0", the corresponding SID bit is not compared for the received ID and the mailbox ID.</p> <p>When the SID bit is set to "1", corresponding SID bit compares received ID with mailbox ID.</p> <p>0: Corresponding SID bit is not compared 1: Corresponding SID bit is compared</p> |
| 17 to 0 | EID | Undefined | R/W | <p>Extended ID Bits</p> <p>The EID bit is the filter mask bit for CAN extended ID bit.</p> <p>This bit is used to receive extended ID messages.</p> <p>When the EID bit is set to "0", corresponding EID bit does not compare received ID with mailbox ID.</p> <p>When the EID bit is set to "1", corresponding EID bit compares received ID with mailbox ID.</p> <p>0: Corresponding EID bit is not compared 1: Corresponding EID bit is compared</p> |

47.2.5 CANi FIFO Received ID Compare Registers (CiFIDCR0 and CiFIDCR1) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Registers CiFIDCR0 and CiFIDCR1 are enabled when the MBM bit in the CiCTLR register is set to "1" (FIFO mailbox mode). Bits EID, SID, RTR, and IDE in registers CiMB60 to CiMB63 are disabled.

For the usage of these registers, refer to section 47.6, Acceptance Filtering and Masking Function.

Write to registers CiFIDCR0 and CiFIDCR1 in CAN reset mode or CAN halt mode.

CAN0 FIFO Received ID Compare Register 0 (C0FIDCR0)

CAN0 FIFO Received ID Compare Register 1 (C0FIDCR1)

CAN1 FIFO Received ID Compare Register 0 (C1FIDCR0)

CAN1 FIFO Received ID Compare Register 1 (C1FIDCR1)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|---|
| 31 | IDE | Undefined | R/W | <p>ID Extension Bit*</p> <p>The IDE bit sets the ID format to standard ID or extended ID. The IDE bit is enabled when the IDFM bit in the CiCTLR register is "10" (mixed ID mode). When the IDFM bit is "10", the IDE bit specifies the following operation.</p> <p>When both IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "0", only standard ID frames can be received.</p> <p>When both IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "1", only extended ID frames can be received.</p> <p>When the IDE bits in registers CiFIDCR0 and CiFIDCR1 are set to "0" or "1" individually, both standard ID and extended ID frames can be received.</p> <p>0: Standard ID 1: Extended ID</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|--|
| 30 | RTR | Undefined | R/W | <p>Remote Transmission Request Bit</p> <p>The RTR bit sets the specified frames format of data frame or remote frames. The RTR bit specifies the following operation.</p> <p>When both RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "0", only data frames can be received.</p> <p>When both RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "1", only remote frames can be received.</p> <p>When the RTR bits in registers CiFIDCR0 and CiFIDCR1 are set to "0" or "1" individually, both data frames and remote frames can be received.</p> <p>0: Data frame 1: Remote frame</p> |
| 29 | — | Undefined | R | <p>Reserved bit</p> <p>The reset value is undefined. The write value should be "0". This bit is read as "0" after "0" is written to.</p> |
| 28 to 18 | SID | Undefined | R/W | <p>Standard ID Bits</p> <p>The SID bit sets the standard ID of data frames and remote frames. The SID bit is used to receive both standard ID and extended ID messages.</p> <p>0: Corresponding SID bit is "0" 1: Corresponding SID bit is "1"</p> |
| 17 to 0 | EID | Undefined | R/W | <p>Extended ID Bits</p> <p>The EID bit sets the extended ID of data frames and remote frames. The EID bit is used to receive extended ID messages.</p> <p>0: Corresponding EID bit is "0" 1: Corresponding EID bit is "1"</p> |

Note: * When the IDFM bit is not "10", the IDE bit should be written with "0".

47.2.6 CANi Mask Invalid Registers (CiMKIVLR0 and CiMKIVLR1) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Each bit in registers CiMKIVLR0 and CiMKIVLR1 corresponds to a mailbox. The correspondence between the bits and mailboxes is as follows:

- Bit 0 in the CiMKIVLR0 register corresponds to mailbox 0 (MB0).
- Bit 31 in the CiMKIVLR0 register corresponds to mailbox 31 (MB31).
- Bit 0 in the CiMKIVLR1 register corresponds to mailbox 32 (MB32).
- Bit 31 in the CiMKIVLR1 register corresponds to mailbox 63 (MB63).

When each bit is "1", the acceptance mask for the mailbox corresponding to the bit number is disabled. In this case, a receiving message is stored into mailbox only its ID matches bits SID and EID in the CiMBj register.

Write to registers CiMKIVLR0 and CiMKIVLR1 either in CAN reset mode or CAN halt mode.

CAN0 Mask Invalid Register 0 (C0MKIVLR0)

CAN1 Mask Invalid Register 0 (C1MKIVLR0)

| 29 | — | Undefined | R | <p>Reserved bit</p> <p>The reset value is undefined. The write value should be "0". This bit is read as "0" after "0" is written to.</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|---|
| 28 to 18 | SID | Undefined | R/W | Standard ID Bits The SID bit sets the standard ID of data frames and remote frames. The SID bit is used to transmit or receive both standard ID and extended ID messages. 0: Corresponding SID bit is "0" 1: Corresponding SID bit is "1" |
| 17 to 0 | EID | Undefined | R/W | Extended ID Bits*2 The EID bit sets the extended ID of data frames and remote frames. The EID bit is used to transmit or receive extended ID messages. 0: Corresponding EID bit is "0" 1: Corresponding EID bit is "1" |

Notes: 1. When the IDFM bit is not "10", it should be written with "0".
2. If the mailbox has received a standard ID message, the EID bit in the mailbox is undefined.

CAN0 Mailbox Register 0 to 63 (COMB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|---------|--------|---------------|-----|--|
| 15 to 4 | — | Undefined | R | Reserved bits The reset value is undefined. The write value should be "0". These bits are read as "0" after "0" is written to. |
| 3 to 0 | DLC | Undefined | R/W | Data Length Code Bits* The DLC is used to set the number of data bytes to be transmitted in a data frame. When data is requested using a remote frame, the number of data bytes to be requested is set. When a data frame is received, the number of received data bytes is stored. When a remote frame is received, the number of requested data bytes is stored. B'0000: Data length = 0 byte B'0001: Data length = 1 byte B'0010: Data length = 2 bytes B'0011: Data length = 3 bytes B'0100: Data length = 4 bytes B'0101: Data length = 5 bytes B'0110: Data length = 6 bytes B'0111: Data length = 7 bytes B'1xxx: Data length = 8 bytes Legend: x represents any value. |

Note: * If the mailbox has received a message with n bytes less than 8 bytes, the values of DATAn to DATA7 in the mailbox are undefined.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|------------|---------------|-----|--|
| 7 to 0 | DATA0 to 7 | Undefined | R/W | Data Bytes 0 to 7*1*2 DATA0 to DATA7 store the transmitted or received CAN message data. Transmission or reception starts from DATA0. The bit order on the CAN bus is MSB first, and transmission or reception starts from bit 7. |

- Notes:
1. If the mailbox has received a message with n bytes less than 8 bytes, the values of DATAn to DATA7 in the mailbox are undefined.
 2. If the mailbox has received a remote frame, the previous values of DATA0 to DATA7 in the mailbox are retained.

CAN0 Mailbox Register 0 to 63 (C0MB0 to 63)

CAN1 Mailbox Register 0 to 63 (C1MB0 to 63)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|---------|--------|---------------|-----|---|
| 15 to 8 | TSH | Undefined | R/W | Time Stamp Higher Byte TSL and TSH store the counter value of the time stamp when received messages are stored in the mailbox. |
| 7 to 0 | TSL | Undefined | R/W | Time Stamp Lower Byte TSL and TSH store the counter value of the time stamp when received messages are stored in the mailbox. |

47.2.8 CANi Mailbox Interrupt Enable Registers (CiMIER0 and CiMIER1) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Interrupts can enable individually for each mailbox.

In normal mailbox mode (all bits) and in FIFO mailbox mode (bits 23 to 0 in the CiMIER1 register and all bits in the CiMIER0 register), each bit corresponds to the mailbox with the related number. These bits enable or disable transmission/reception complete interrupts for the corresponding mailboxes.

- Bit 0 in the CiMIER0 register corresponds to mailbox 0 (MB0).
- Bit 31 in the CiMIER0 register corresponds to mailbox 31 (MB31).
- Bit 0 in the CiMIER1 register corresponds to mailbox 32 (MB32).
- Bit 31 in the CiMIER1 register corresponds to mailbox 63 (MB63).

In FIFO mailbox mode, bits 29, 28, 25, and 24 of the CiMIER1 register specify whether transmit/receive FIFO interrupts are enabled/disabled and timing when interrupt requests are generated.

Write to registers CiMIER0 and CiMIER1 only when the associated CiMCTLj register (i = 0, 1) (j = 0 to 63) is "H'00" and the corresponding mailbox is not processing a transmission or reception abort request. In FIFO mailbox mode, change the bits in the CiMIER1 register for the associated FIFO only when:

- The TFE bit in the CiTFCR register is 0 and the TFEST bit is 1.
- The RFE bit in the CiRFCR register is 0 and the RFEST bit is 1.

CAN0 Mailbox Interrupt Enable Register 1 (COMIER1)

CAN1 Mailbox Interrupt Enable Register 1 (C1MIER1)

| Bit | Symbol | Initial Value | R/W | Description |
|-----|---------|---------------|-----|---|
| 4 | ONESHOT | B'0 | R/W | <p>One-shot Enable Bit*³</p> <p>The ONESHOT bit can be used in the following two ways, receive mode and transmit mode:</p> <p>One-Shot Receive Mode</p> <p>When the ONESHOT bit is set to "1" in receive mode (RECREQ bit = "1" and TRMREQ bit = "0"), the mailbox receives a message only one time. The mailbox does not behave as a receive mailbox after having received a message one time. The behavior of bits NEWDATA and INVALIDDATA is the same as in normal reception mode. In one-shot receive mode, the MSGLOST bit is not set to "1".</p> <p>To set the ONESHOT bit to "0", first write "0" to the RECREQ bit and ensure that it has been set to "0".</p> <p>One-Shot Transmit Mode</p> <p>When the ONESHOT bit is set to "1" in transmit mode (RECREQ bit = "0" and TRMREQ bit = "1"), the CAN module transmits a message only one time.</p> <p>The CAN module does not transmit the message again if a CAN bus error or CAN bus arbitration lost occurs. When transmission is completed, the SENTDATA bit is set to "1". If transmission is not completed due to a CAN bus error or CAN bus arbitration lost, the TRMABT bit is set to "1".</p> <p>Set the ONESHOT bit to "0" after the SENTDATA or TRMABT bit is set to "1".</p> <p>0: One-shot reception or one-shot transmission disabled 1: One-shot reception or one-shot transmission enabled</p> |
| — | — | B'0 | R | <p>Reserved bit (Registers CiMCTL0 to CiMCTL31)</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p> |
| 3 | — | B'0 | R | <p>Reserved bit</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|-------------|---------------|-----|---|
| 2 | TRMABT | B'0 | R/W | <p>Transmission Abort Complete Flag (Transmit mailbox setting enabled)*1*2</p> <p>The TRMABT bit is set to "1" in the following cases:</p> <p>Following a transmission abort request, when the transmission abort is completed before starting transmission.</p> <p>Following a transmission abort request, when the CAN module detects CAN bus arbitration lost or a CAN bus error.</p> <p>In one-shot transmission mode (RECREQ bit = "0", TRMREQ bit = "1", and ONESHOT bit = "1"), when the CAN module detects CAN bus arbitration lost or a CAN bus error.</p> <p>The TRMABT bit is not set to "1" when data transmission is completed. In this case, the SENTDATA bit is set to "1".</p> <p>The TRMABT bit is set to "0" by writing "0" by a program.</p> <p>0: Transmission has started, transmission abort failed because transmission is completed, or transmission abort is not requested</p> <p>1: Transmission abort is completed</p> |
| | MSGLOST | B'0 | R/W | <p>Message Lost Flag (Receive mailbox setting enabled)*1*2</p> <p>The MSGLOST bit is set to "1" when the mailbox is overwritten or overrun by a new received message while the NEWDATA bit is "1".</p> <p>The MSGLOST bit is set to "1" at the end of the 6th bit of EOF.</p> <p>The MSGLOST bit is set to "0" by writing "0" by a program.</p> <p>In both overwrite and overrun modes, the MSGLOST bit is not set to "0" by writing "0" by a program during the 5 peripheral clock (clkp1) cycles following the 6th bit of EOF.</p> <p>0: Message is not overwritten or overrun</p> <p>1: Message is overwritten or overrun</p> |
| 1 | TRMACTIVE | B'0 | R | <p>Transmission-in-Progress Status Flag (Transmit mailbox setting enabled)</p> <p>The TRMACTIVE bit is set to "1" when the corresponding mailbox of the CAN module begins transmitting a message.</p> <p>The TRMACTIVE is set to "0" when the CAN module has lost CAN bus arbitration, a CAN bus error occurs, or data transmission is completed.</p> <p>0: Transmission is pending or transmission is not requested</p> <p>1: From acceptance of transmission request to completion of transmission, or error/arbitration lost</p> |
| | INVALIDDATA | B'0 | R | <p>Reception-in-Progress Status Flag (Receive mailbox setting enabled)</p> <p>After the completion of a message reception, the INVALIDDATA bit is set to "1" while the received message is being updated into the corresponding mailbox.</p> <p>The INVALIDDATA bit is set to "0" immediately after the message has been stored. If the mailbox is read while the INVALIDDATA bit is "1", the data is undefined.</p> <p>0: Message valid</p> <p>1: Message being updated</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 0 | SENTDATA | B'0 | R/W | <p>Transmission Complete Flag (Transmit mailbox setting enabled)*1*2</p> <p>The SENTDATA bit is set to "1" when data transmission from the corresponding mailbox is completed.</p> <p>The SENTDATA bit is set to "0" by writing "0" by a program.</p> <p>To set the SENTDATA bit to "0", first set the TRMREQ bit to "0".</p> <p>Bits SENTDATA and TRMREQ cannot be set to "0" simultaneously.</p> <p>To transmit a new message from the corresponding mailbox, set the SENTDATA bit to "0".</p> <p>0: Transmission is not completed (pending)</p> <p>1: Transmission is completed (success)</p> |
| | NEWDATA | B'0 | R/W | <p>Reception Complete Flag (Receive mailbox setting enabled)*1*2</p> <p>The NEWDATA bit is set to "1" when a new message is being stored or has been stored to the mailbox. The timing for setting this bit to "1" is simultaneous with the INVALIDDATA bit.</p> <p>The NEWDATA bit is set to "0" by writing "0" by a program.</p> <p>The NEWDATA bit is not set to "0" by writing "0" by a program while the related INVALIDDATA bit is "1".</p> <p>0: No data has been received or "0" is written to the NEWDATA bit</p> <p>1: A new message is being stored or has been stored to the mailbox</p> |

- Notes:
1. Write "0" only. Writing "1" has no effect.
 2. When writing "0" to bits NEWDATA, SENTDATA, MSGLOST, TRMABT, RECREQ, and TRMREQ by a program, use the MOV instruction to ensure that only the specified bit is set to "0" and the other bits are set to "1".
 3. To enter one-shot receive mode, write "1" to the ONESHOT bit at the same time as setting the RECREQ bit to "1".
To exit one-shot receive mode, write "0" to the ONESHOT bit after writing "0" to the RECREQ bit and confirming it has been set to "0".
To enter one-shot transmit mode, write "1" to the ONESHOT bit at the same time as setting the TRMREQ bit to "1".
To exit one-shot transmit mode, write "0" to the ONESHOT bit after the message has been transmitted or aborted.
 4. Do not set both the RECREQ and TRMREQ bits to "1".
 5. When setting the RECREQ bit to "0", set bits MSGLOST, NEWDATA, RECREQ to "0" simultaneously.

47.2.10 CANi Receive FIFO Control Register (CiRFCR) (i = 0, 1)

|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

When the receive FIFO is not empty, write "H'FF" to the CiRFPCR register by a program to increment the CPU-side pointer for the receive FIFO to the next mailbox location.

Do not write to the CiRFPCR register when the RFE bit in the CiRFCR register is "0" (receive FIFO disabled).

Both the CAN-side pointer and the CPU-side pointer are incremented when a new message is received and the RFFST bit is "1" (receive FIFO is full) in overwrite mode. When the RFMLF bit is "1" in this condition, the CPU-side pointer cannot be incremented by writing to the CiRFPCR register by a program.

|--------|--------|---------------|-----|--|
| 7 | SEST | B'1 | R | <p>Search Result Status Bit</p> <p>The SEST bit is set to "1" when no corresponding mailbox is found after searching all mailboxes. For example, in transmit mailbox search mode, the SEST bit is set to "1" when no SENTDATA bit for mailboxes is "1". The SEST bit is set to "0" when at least one SENTDATA bit is "1". When the SEST bit is "1", the value of the MBNST bits is undefined.</p> <p>0: Search result found 1: No search result</p> |
| 6 | — | B'0 | R | <p>Reserved bit</p> <p>This bit is always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to this bit.</p> |
| 5 to 0 | MBNST | All 0 | R | <p>Search Result Mailbox Number Status Bits</p> <p>The MBNST bit outputs the smallest mailbox number that is searched in each mode of the CiMSMR register. In receive mailbox, transmit mailbox, and message lost search modes, the value of the mailbox i.e., the search result to be output, is updated as described below:</p> <p>When the NEWDATA, SENTDATA or MSGLOST bit for the output mailbox is set to "0".</p> <p>When the NEWDATA, SENTDATA or MSGLOST bit for a higher-priority mailbox is set to "1".</p> <p>In receive mailbox search and message lost search modes, the receive FIFO (mailbox [60]) is output when the receive FIFO is not empty and there are no unread received messages or no lost messages in any of the normal mailboxes (mailboxes [0] to [55]). In transmit mailbox search mode, the transmit FIFO (mailbox [56]) is not output. Table 47.8 lists the behavior of MBNST bit in FIFO mailbox mode.</p> <p>In channel search mode, the MBNST bit outputs the corresponding channel number. After the CiMSSR register is read by a program, the next target channel number is output.</p> |

Table 47.8 Operation of MBNST Bit in FIFO Mailbox Mode

| MBSM Bit | Mailbox [56] (Transmit FIFO) | Mailbox [60] (Receive FIFO) |
|-----------------|-------------------------------------|---|
| "00" | Mailbox [56] is not output. | Mailbox [60] is output when no NEWDATA bit for the normal mailbox is set to "1" and the receive FIFO is not empty. |
| "01" | | Mailbox [60] is not output. |
| "10" | | Mailbox [60] is output when no MSGLOST bit for the normal mailbox is set to "1" and the RFMLF bit is set to "1" (receive FIFO message lost has occurred) in the receive FIFO. |
| "11" | | Mailbox [60] is not output. |

47.2.17 CANi Channel Search Support Register (CiCSSR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The bits in the CiCSSR register, which are set to "1", are encoded by an 8/3 encoder (the lower bit position, the higher priority) and output to the MBNST bits in the CiMSSR register.

The CiMSSR register outputs the updated value whenever the CiMSSR register is read by a program.

Write to the CiCSSR register only when the MBSM bit in the CiMSMR register is "11" (channel search mode). Write to this register in CAN operation mode or CAN halt mode.

CAN0 Channel Search Support Register (C0CSSR)

CAN1 Channel Search Support Register (C1CSSR)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 7 to 0 | CiCSSR | Undefined | R/W | When the value for the channel search is input, the channel number is output to the CiMSSR register. |

Figure 47.4 shows the write and read of registers CiCSSR and CiMSSR.

Figure 47.4 Write and Read of Registers CiCSSR and CiMSSR (i = 0, 1)

The value of the CiCSSR register is also updated whenever the CiMSSR register is read. When the CiCSSR register is read, the value before the 8/3 encoder conversion is read.

47.2.18 CANi Acceptance Filter Support Register (CiAFSR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The acceptance filter support unit (ASU) can be used for data table (8 bits × 256) search. In the data table, all standard IDs created by the user are set to be valid/invalid in bit units. When the CAFSR register is written with the 16-bit unit data including the SID bit in the CiMBj register (j = 0 to 63), in which a received ID is stored, a decoded row (byte offset) position and column (bit) position for data table search can be read. The ASU can be used for standard (11-bit) IDs only.

The ASU is enabled in the following cases:

- When the ID to receive cannot be masked by the acceptance filter.
(Example) IDs to receive: H'078, H'087, H'111
- When there are too many IDs to receive and software filtering time is expected to be shortened.

Write to the CiAFSR register in CAN operation mode or CAN halt mode.

CAN0 Acceptance Filter Support Register (COAFSR)

CAN1 Acceptance Filter Support Register (C1AFSR)

<After Reset: Undefined>

| Bit | Symbol | Initial Value | R/W | Description |
|---------|--------|---------------|-----|--|
| 15 to 0 | CiAFSR | Undefined | R/W | After the standard ID of a received message is written, the value converted for data table search can be read. |

Figure 47.5 shows the write and read of CiAFSR register.

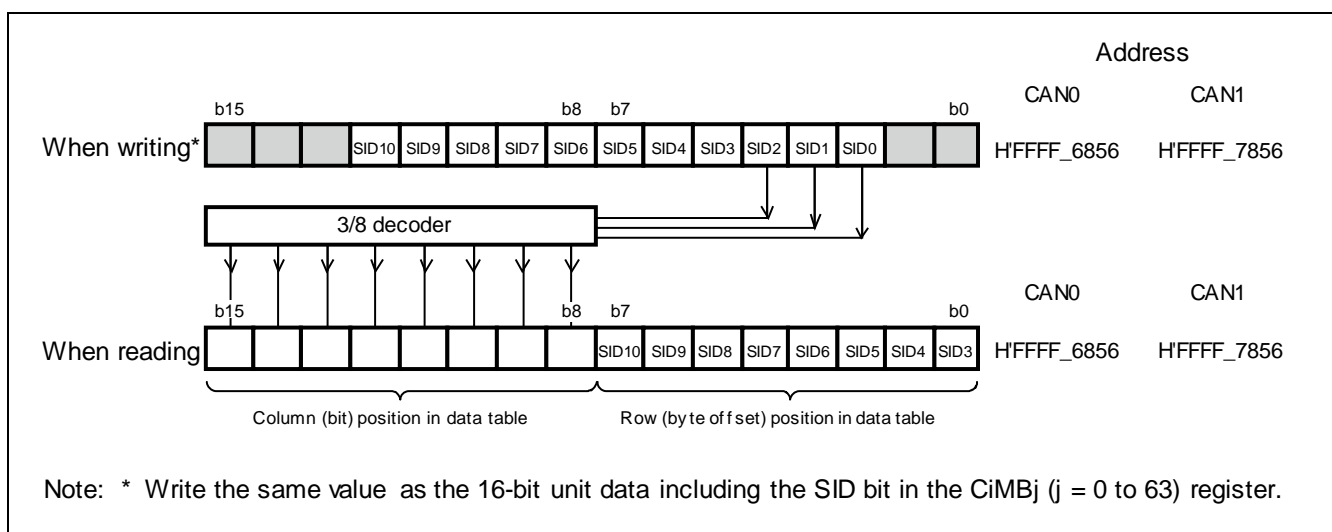

Figure 47.5 Write and Read of CiAFSR Register (i = 0, 1)

47.2.19 CANi Error Interrupt Enable Register (CiEIER) (i = 0, 1)

47.2.20 CANi Error Interrupt Factor Judge Register (CiEIFR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

If an event corresponding to each bit occurs, the corresponding bit in the CiEIFR register is set to "1" regardless of the setting of the CiEIER register.

To set each bit to "0", write "0" by a program. If the set timing occurs simultaneously with the clear timing by the program, the bit becomes "1".

When writing "0" to a single bit by a program, use the MOV instruction to ensure that only the specified bit is set to "0" and the other bits are set to "1". Writing "1" has no effect to these bit values.

CAN0 Error Interrupt Factor Judge Register (C0EIFR)

CAN1 Error Interrupt Factor Judge Register (C1EIFR)

| | | | | | | | | |
|----------------|------|------|------|-------|-------|------|------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|--|
| 7 | BLIF | B'0 | R/W | Bus Lock Detect Flag* The BLIF bit becomes 1 if 32 consecutive dominant bits are detected on the CAN bus while the CAN module is in CAN operation mode. After the BLIF bit becomes 1, bus lock can be detected again after either of the following conditions is satisfied: <ul style="list-style-type: none"> • After this bit is set to 0 from 1, recessive bits are detected (bus lock is resolved). • After this bit is set to 0 from 1, the CAN module enters CAN reset mode and then enters CAN operation mode again (internal reset). 0: No bus lock detected 1: Bus lock detected |
| 6 | OLIF | B'0 | R/W | Overload Frame Transmission Detect Flag* The OLIF bit is set to "1" if the transmitting condition of an overload frame is detected when the CAN module performs transmission or reception. 0: No overload frame transmission detected 1: Overload frame transmission detected |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|--|
| 5 | ORIF | B'0 | R/W | <p>Receive Overrun Detect Flag*</p> <p>The ORIF bit is set to "1" when a receive overrun occurs.</p> <p>This bit is not to set to "1" in overwrite mode. In overwrite mode, a reception complete interrupt request is generated if an overwrite condition occurs and the ORIF bit is not set to "1".</p> <p>In normal mailbox mode, if an overrun occurs in any of mailboxes [0] to [63] in overrun mode, this bit is set to "1".</p> <p>In FIFO mailbox mode, if an overrun occurs in any of mailboxes [0] to [55] or the receive FIFO in overrun mode, this bit is set to "1".</p> <p>0: No receive overrun detected 1: Receive overrun detected</p> |
| 4 | BORIF | B'0 | R/W | <p>Bus-Off Recovery Detect Flag*</p> <p>The BORIF bit is set to "1" when the CAN module recovers from the bus-off state normally by detecting 11 consecutive bits 128 times in the following conditions:</p> <p>When the BOM bit in the CiCTRL register is "00". When the BOM bit is "10". When the BOM bit is "11".</p> <p>The BORIF bit is not set to "1" if the CAN module recovers from the bus-off state in the following conditions:</p> <p>When the CANM bit in the CiCTRL register is set to "01" or "11" (CAN reset mode). When the RBOC bit in the CiCTRL register is set to "1" (forcible return from bus-off). When the BOM bit is "01". When the BOM bit is "11" and the CANM bit is set to "10" (CAN halt mode) before normal recovery occurs.</p> <p>0: No bus-off recovery detected 1: Bus-off recovery detected</p> |
| 3 | BOEIF | B'0 | R/W | <p>Bus-Off Entry Detect Flag*</p> <p>The BOEIF bit is set to "1" when the CAN error state becomes bus-off (the TEC value exceeds 255).</p> <p>The BOEIF bit is also set to "1" when the BOM bit in the CiCTRL register is "01" (entry to CAN halt mode automatically at bus-off entry) and the CAN module becomes the bus-off state.</p> <p>0: No bus-off entry detected 1: Bus-off entry detected</p> |
| 2 | EPIF | B'0 | R/W | <p>Error Passive Detect Flag*</p> <p>The EPIF bit is set to "1" when the CAN error state becomes error-passive (the REC or TEC value exceeds 127).</p> <p>The EPIF bit is set to "1" only when the REC or TEC initially exceeds 127. Thus, if "0" is written to the EPIF bit by a program while the REC or TEC remains greater than 127, the EPIF bit is not set to "1" until the REC and TEC goes below 127 and then exceeds 127 again.</p> <p>0: No error passive detected 1: Error passive detected</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|---|
| 1 | EWIF | B'0 | R/W | <p>Error Warning Detect Flag*</p> <p>The EWIF bit is set to "1" when the value of the receive error counter (REC) or transmit error counter (TEC) exceeds 95.</p> <p>The EWIF bit is set to "1" only when the REC or TEC initially exceeds 95. Thus, if "0" is written to the EWIF bit by a program while the REC or TEC remains greater than 95, the EWIF bit is not set to "1" until the REC and TEC goes below 95 and then exceeds 95 again.</p> <p>0: No error warning detected 1: Error warning detected</p> |
| 0 | BEIF | B'0 | R/W | <p>Bus Error Detect Flag*</p> <p>The BEIF bit is set to "1" when a bus error is detected.</p> <p>0: No bus error detected 1: Bus error detected</p> |

Note: * Only "0" may be written to this bit. (Writing "1" has no effect.) When writing "0" to specific bits in software, use the MOV instruction and write "0" to each bit to be cleared to "0" and "1" to all other bits.

Table 47.9 lists the behavior of bits BOEIF and BORIF according to BOM bit setting value.

Table 47.9 Behavior of Bits BOEIF and BORIF according to BOM Bit Setting Value

| BOM Bit | BOEIF Bit | BORIF Bit |
|----------------|---|--|
| B'00 | Set to "1" on entry to the bus-off state. | Set to "1" on exit from the bus-off state. |
| B'01 | | Do not set to "1". |
| B'10 | | Set to "1" on exit from the bus-off state. |
| B'11 | | Set to "1" if normal bus-off recovery occurs before the CANM bit is set to "10" (CAN halt mode). |

47.2.21 CANi Receive Error Count Register (CiRECR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CiRECR register indicates the value of the receive error counter.

For the increment/decrement conditions of the receive error counter, refer to the CAN Specifications (ISO11898-1).

The value in bus-off state is undefined.

CAN0 Receive Error Count Register (C0RECR)

CAN1 Receive Error Count Register (C1RECR)

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 7 to 0 | CiRECR | All 0 | R | Receive Error Count Function The CiRECR register increments or decrements the counter value according to error status of the CAN module during reception. |

47.2.22 CANi Transmit Error Count Register (CiTECR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CiTECR register indicates the value of the transmit error counter.

For the increment/decrement conditions of the transmit error counter, refer to the CAN Specifications (ISO11898-1).

The value in bus-off state is undefined.

CAN0 Transmit Error Count Register (C0TECR)

CAN1 Transmit Error Count Register (C1TECR)

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 7 to 0 | CiTECR | All 0 | R | Transmit Error Count Function The CiTECR register increments or decrements the counter value according to error status of the CAN module during transmission. |

47.2.23 CANi Error Code Store Register (CiECSR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CiECSR register can be used to monitor whether an error has occurred on the CAN bus. Refer to the CAN Specifications (ISO11898-1) to check the generation conditions of each error.

To set each bit except the EDPM bit to "0", write "0" by a program. If the timing at which each bit is set to "1" and the timing at which "0" is written by a program are the same, the relevant bit is set to "1".

CAN0 Error Code Store Register (C0ECSR)

CAN1 Error Code Store Register (C1ECSR)

| | | | | | | | | |
|----------------|------|------|------|------|-----|-----|-----|-----|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | EDPM | ADEF | BE0F | BE1F | CEF | AEF | FEF | SEF |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|--|
| 7 | EDPM | B'0 | R/W | <p>Error Display Mode Select Bit*1*2</p> <p>The EDPM bit selects the output mode of the CiECSR register.</p> <p>When the EDPM bit is set to "0", the CiECSR register outputs the first error code.</p> <p>When the EDPM bit is set to "1", the CiECSR register outputs the accumulated error code.</p> <p>0: Output of first detected error code 1: Output of accumulated error code</p> |
| 6 | ADEF | B'0 | R/W | <p>ACK Delimiter Error Flag*3*4</p> <p>The ADEF bit is set to "1" when a form error is detected with the ACK delimiter during transmission.</p> <p>0: No ACK delimiter error detected 1: ACK delimiter error detected</p> |
| 5 | BE0F | B'0 | R/W | <p>Bit Error (dominant) Flag*3*4</p> <p>The BE0F bit is set to "1" when a dominant bit error is detected.</p> <p>0: No bit error (dominant) detected 1: Bit error (dominant) detected</p> |
| 4 | BE1F | B'0 | R/W | <p>Bit Error (recessive) Flag*3*4</p> <p>The BE1F bit is set to "1" when a recessive bit error is detected.</p> <p>0: No bit error (recessive) detected 1: Bit error (recessive) detected</p> |
| 3 | CEF | B'0 | R/W | <p>CRC Error Flag*3*4</p> <p>The CEF bit is set to "1" when a CRC error is detected.</p> <p>0: No CRC error detected 1: CRC error detected</p> |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|--|
| 2 | AEF | B'0 | R/W | ACK Error Flag*3*4 The AEF bit is set to "1" when an ACK error is detected. 0: No ACK error detected 1: ACK error detected |
| 1 | FEF | B'0 | R/W | Form Error Flag*3*4 The FEF bit is set to "1" when a form error is detected. 0: No form error detected 1: Form error detected |
| 0 | SEF | B'0 | R/W | Stuff Error Flag*3*4 The SEF bit is set to "1" when a stuff error is detected. 0: No stuff error detected 1: Stuff error detected |

- Notes:
1. Write to the EDPM bit in CAN reset mode or CAN halt mode.
 2. If more than one error condition is detected simultaneously, all related bits are set to "1".
 3. Writing "1" has no effect to these bit values.
 4. When writing "0" to bits SEF, FEF, AEF, CEF, BE1F, BE0F, and ADEF by a program, use the MOV instruction to ensure that only the specified bit is set to "0" and the other bits are set to "1".

47.2.24 CANi Time Stamp Register (CiTSR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

When the CiTSR register is read, the value of the time stamp counter (16-bit free-running counter) at that moment is read.

The value of the time stamp counter reference clock is a multiple of 1 bit time, as configured by the TSPS bit in the CiCTRL register.

The time stamp counter stops in CAN sleep mode and CAN halt mode, and is initialized in CAN reset mode.

The time stamp counter value is stored to TSL and TSH in the CiMBj register when a received message is stored in a receive mailbox.

CAN0 Time Stamp Register (C0TSR)

CAN1 Time Stamp Register (C1TSR)

<After Reset: H'0000>

| Bit | Symbol | Initial Value | R/W | Description |
|---------|--------|---------------|-----|--|
| 15 to 0 | CiTSR | All 0 | R | Free-running counter value for the time stamp function |

Note: Read the CiTSR register in 16-bit units.

47.2.25 CANi Test Control Register (CiTCR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Write to the CiTCR register in CAN halt mode only.

CAN0 Test Control Register (C0TCR)

CAN1 Test Control Register (C1TCR)

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|--|
| 7 to 3 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2, 1 | TSTM | All 0 | R/W | CAN Test Mode Select Bits The TSTM bit selects the CAN test mode. For details on the CAN test modes, see section 47.2.25 (1), Listen-Only Mode, section 47.2.25 (2), Self-Test Mode 0 (External Loop Back), and section 47.2.25 (3), Self-Test Mode 1 (Internal Loop Back). B'00: Other than CAN test mode B'01: Listen-only mode B'10: Self-test mode 0 (external loop back) B'11: Self-test mode 1 (internal loop back) |
| 0 | TSTE | B'0 | R/W | CAN Test Mode Enable Bit When the TSTE bit is set to "0", CAN test mode is disabled. When the TSTE bit is set to "1", CAN test mode is enabled. 0: CAN test mode disabled 1: CAN test mode enabled |

(1) Listen-Only Mode

The ISO 11898-1 recommends an optional bus monitoring mode. In listen-only mode, the CAN node is able to receive valid data frames and valid remote frames. It sends only recessive bits on the CAN bus, and the protocol controller is not required to send the ACK bit, overload flag, or active error flag.

Listen-only mode can be used for baud rate detection.

Do not request transmission from any mailboxes in this mode.

Figure 47.6 shows the connection when listen-only mode is selected.

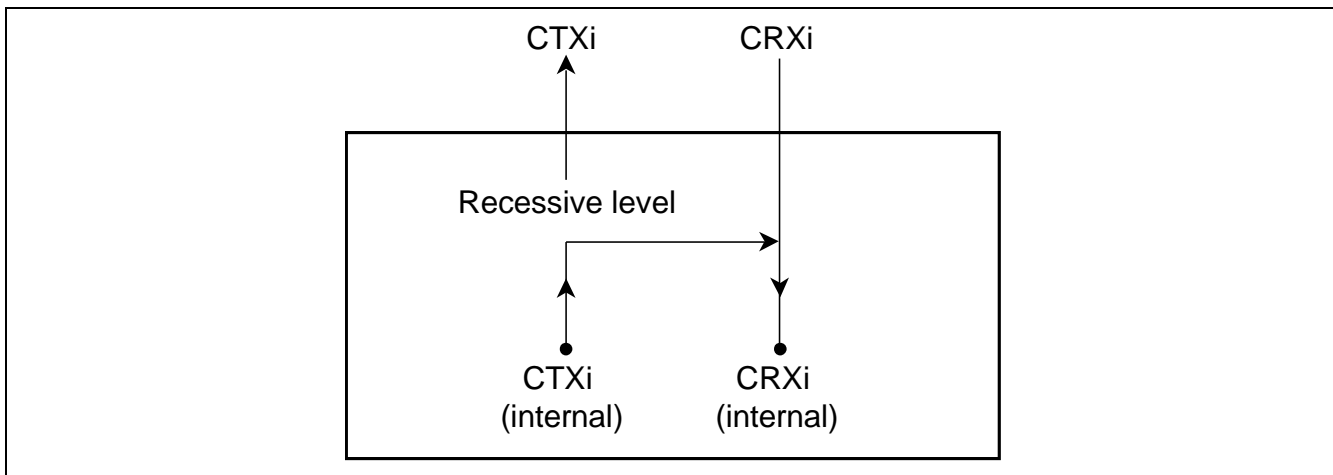

Figure 47.6 Connection when Listen-Only Mode is Selected

(2) Self-Test Mode 0 (External Loop Back)

Self-test mode 0 is provided for CAN transceiver tests.

In this mode, the protocol controller treats its own transmitted messages as messages received via the CAN transceiver and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

Connect the CANi_TX/CANi_RX pins to the transceiver.

Figure 47.7 shows the connection when self-test mode 0 is selected.

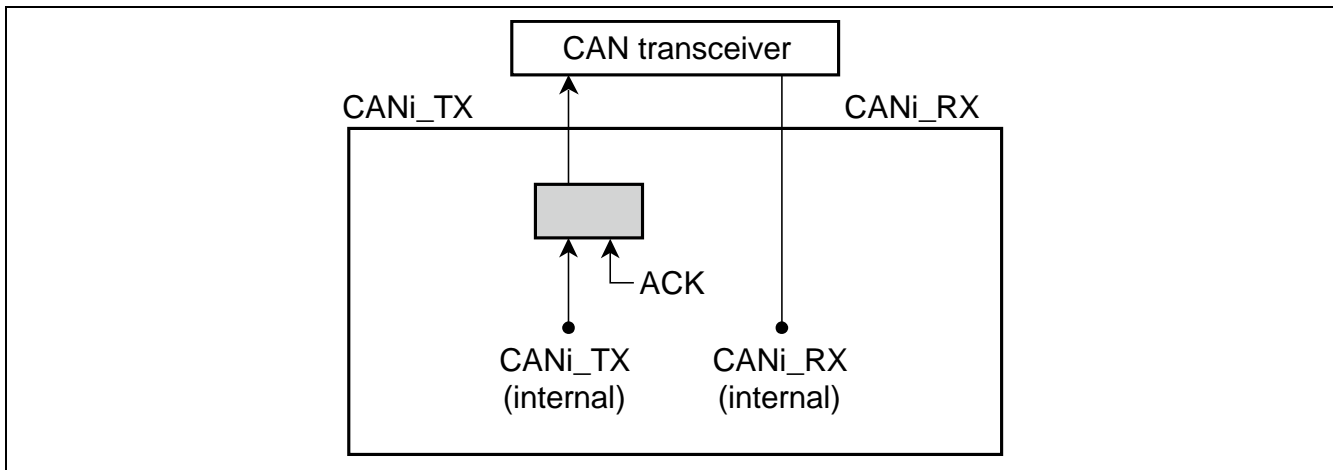

Figure 47.7 Connection when Self-Test Mode 0 is Selected

(3) Self-Test Mode 1 (Internal Loop Back)

Self-test mode 1 is provided for self-test functions.

In this mode, the protocol controller treats its transmitted messages as received messages and stores them into the receive mailbox. To be independent from external stimulation, the protocol controller generates the ACK bit.

In self-test mode 1, the protocol controller performs an internal feedback from the internal CANi_TX pin to the internal CANi_RX pin. The input value of the external CANi_RX pin is ignored. The external CANi_TX pin outputs only recessive bits. The CANi_TX/CANi_RX pins do not need to be connected to the CAN bus or any external device.

Figure 47.8 shows the connection when self-test mode 1 is selected.

Figure 47.8 Connection when Self-Test Mode 1 is Selected

47.2.26 CANi Interrupt Status Register (CiISR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CiISR register shows interrupt sources before masking by the CiIER register.

CAN0 Interrupt Status Register (C0ISR)

CAN1 Interrupt Status Register (C1ISR)

| | | | | | | | | |
|----------------|---|---|------|------|------|-----------|-------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | ERSF | RXFF | TXFF | RX M0F | RXM1F | TXMF |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R/W | R | R | R |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|------|--------|---------------|-----|---|
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | ERSF | B'0 | R | Error (ERS) Interrupt Status Bit* ¹ The ERSF bit shows the error interrupt source status. 0: ERS interrupt source not detected 1: ERS interrupt source detected |
| 4 | RXFF | B'0 | R/W | Reception FIFO (RXF) Interrupt Status Bit* ² The RXFF bit shows the FIFO receive interrupt source status. 0: RXF interrupt source not detected 1: RXF interrupt source detected The RXFF is cleared to "0" by writing "0" to it by software. (writing "1" has no effect) |
| 3 | TXFF | B'0 | R/W | Transmission FIFO (TXF) Interrupt Status Bit* ³ The TXFF bit shows the FIFO transmit interrupt source status. 0: TXF interrupt source not detected 1: TXF interrupt source detected The TXFF is cleared to "0" by writing "0" to it by software. (writing "1" has no effect) |
| 2 | RXM0F | B'0 | R | Mailbox 0 Successful Reception (RXM0) Interrupt Status Bit* ⁴ The RXM0F bit shows the successful reception interrupt source status for mailbox 0. 0: RXM0 interrupt source not detected 1: RXM0 interrupt source detected |
| 1 | RXM1F | B'0 | R | Mailbox 1 to 63 Successful Reception (RXM1) Interrupt Status Bit* ⁵ The RXM1F bit shows the successful reception interrupt source status for mailboxes 1 to 63. 0: RXM1 interrupt source not detected 1: RXM1 interrupt source detected |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|---|
| 0 | TXMF | B'0 | R | Mailbox 32 to 63 Successful Transmission (TXM) Interrupt Status Bit* ⁶ The TXMF bit shows the successful transmission interrupt source status for mailboxes 32 to 63. 0: TXM interrupt source not detected 1: TXM interrupt source detected |

- Notes:
1. The ERSF bit is set to "1" when a bit in one of the CiEIFR[j] registers is set to "1" due to a communication error while the corresponding bit in the CiEIER[j] register is set to "1" (j = 0 to 7).
 2. The RXFF bit is set to "1" when bit 6 or 5 in the CiRFCR register is set to "1" because of a reception FIFO full or warning condition due to the setting of CiMIER[61].
 3. The TXFF bit is set to "1" when the transmission FIFO message count reaches the specified value due to the setting of CiMIER[57].
 4. After the NEWDATA bit in CiMCTL0 is set to "1" at the end of a receive operation, the RXM0F bit is set to "1" if storing of the receive data is complete (corresponding INVALIDDATA bit value changed from "1" to "0") and the CiMIER0[0] bit has been set to "1".
 5. After the NEWDATA bit in CiMCTLj is set to "1" at the end of a receive operation, the RXM1F bit is set to "1" if storing of the receive data is complete (corresponding INVALIDDATA bit value changed from "1" to "0") and the bit in CiMIER0 or CiMIER1 corresponding to mailbox j has been set to "1" (j = 1 to 63).
 6. The TXMF bit is set to "1" when the bit in the CiMIER1 register corresponding to mailbox j is set to "1" while the value of the SENTDATA bit in the CiMCTLj register is "1" following a successful reception (j = 32 to 63).

47.2.27 CANi Interrupt Enable Register (CiIER) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

The CiIER register can be used by an application to cause some interrupts to be ignored while processing by an interrupt service routine is taking place. Each bit affects the individual interrupt source corresponding to it.

CAN0 Interrupt Enable Register (C0IER)

CAN1 Interrupt Enable Register (C1IER)

| | | | | | | | | |
|----------------|---|---|-------|-------|-------|--------|--------|-------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | ERSIE | RXFIE | TXFIE | RXM0IE | RXM1IE | TXMIE |

| R/W: | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|------|--------|---------------|-----|--|
| 7, 6 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 5 | ERSIE | B'0 | R/W | Error (ERS) Interrupt Enable Bit The ERSIE bit enables or disables the ERS interrupt controller. 0: ERS interrupt disabled 1: ERS interrupt enabled |
| 4 | RXFIE | B'0 | R/W | Reception FIFO (RXF) Interrupt Enable Bit The RXFIE bit enables or disables the RXF interrupt controller. 0: RXF interrupt disabled 1: RXF interrupt enabled |
| 3 | TXFIE | B'0 | R/W | Transmission FIFO (TXF) Interrupt Enable Bit The TXFIE bit enables or disables the TXF interrupt controller. 0: TXF interrupt disabled 1: TXF interrupt enabled |
| 2 | RXM0IE | B'0 | R/W | Mailbox 0 Successful Reception (RXM0) Interrupt Enable Bit The RXM0IE bit enables or disables the RXM0 interrupt controller. 0: RXM0 interrupt disabled 1: RXM0 interrupt enabled |
| 1 | RXM1IE | B'0 | R/W | Mailbox 1 to 63 Successful Reception (RXM1) Interrupt Enable Bit The RXM1IE bit enables or disables the RXM1 interrupt controller. 0: RXM1 interrupt disabled 1: RXM1 interrupt enabled |
| 0 | TXMIE | B'0 | R/W | Mailbox 32 to 63 Successful Transmission (TXM) Interrupt Enable Bit The TXMIE bit enables or disables the TXM interrupt controller. 0: TXM interrupt disabled 1: TXM interrupt enabled |

47.2.28 CANi Mailbox Search Mask Register (CiMBSMR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Write to the CiMBSMR register in CAN halt mode only.

CAN0 Mailbox Search Mask Register (COMBSMR)

CAN1 Mailbox Search Mask Register (C1MBSMR)

| | | | | | | | | |
|----------------|---|---|---|---|---|---|---|-----------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | MBO SM |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|---|
| 7 to 1 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 0 | MB0SM | B'0 | R/W | Mailbox 0 Search Mask Bit* When the MB0SM bit is set to "1", message box 0 is excluded from the search target for the CANi mailbox search status register. |

Note: * The MB0SM bit is enabled in the search modes except channel search mode. In the RXM1 interrupt handling, this bit is usable to exclude message box 0 from the search target for the CiMSSR register in receive mailbox search mode.

47.2.29 CANi Parity Error Control Register (CiPECR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

This register controls the function of the parity mode and displays a parity error flag

| | | | | | | | | |
|----------------|-----|---|---|---|---|-----|-----|-----|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | PF | — | — | — | — | PIE | PME | PM |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R/W | R/W | R/W |

<After Reset: H'00>

| Bit | Symbol | Initial Value | R/W | Description |
|--------|--------|---------------|-----|---|
| 7 | PF | B'0 | R/W | Parity error flag *2 This bit is set to "1" when a parity error is detected. The bit has to be cleared by the program. As long as this bit is set no further parity error can be detected and the address value in the Parity Error Address Capture Register keeps the address for the first captured parity error. 0: Parity error is not detected 1: Parity error is detected |
| 6 to 3 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |
| 2 | PIE | B'0 | R/W | Parity error interrupt *1 This bit controls the parity error interrupt enable. When this bit is configured to "0", the parity error interrupt is disabled. When this bit is set to "1", the parity error interrupt is enabled. When a parity error interrupt is generated, the parity error flag (CANi Parity Error Control Register, bit 7) should be checked to determine the interrupt source. 0: Parity error interrupt is disabled 1: Parity error interrupt is enabled |
| 1 | PME | B'0 | R/W | Parity enable bit This bit controls the Dual Port RAM parity functionality. When this bit is set to "0", parity checkers are disabled keeping the parity generators still active to store the correct parity bit for each byte when writing to the Dual Port RAM. When this bit is set to "1", parity checkers and parity generators are both active. 0: Parity checker off 1: Parity checker on |

| Bit | Symbol | Initial Value | R/W | Description |
|-----|--------|---------------|-----|--|
| 0 | PM | B'0 | R/W | <p>Parity mode</p> <p>This bit controls the action of the CAN Module following the detection of a parity error.</p> <p>When this bit is programmed to “1” and a parity error is detected while in Operation Mode the CAN module forces the cancellation of a possible pending communication (either reception or transmission) and then enters Halt mode. When the pending communication is cancelled, the Reception Error Counter and Transmission Error Counter are initialized. If a parity error is detected while the CAN module is in its Reset or Halt mode no state transition will take place.</p> <p>In the case where CPU requests transition to Reset Mode at the same time as a parity error occurs then the CPU request to enter Reset Mode will have the highest priority.</p> <p>When this bit is set to “0”, CAN module continues in Operation Mode and the pending communication is not canceled.</p> <p>Regardless of the setting of ParMode (PM) when a parity error occurs and ParModeEn (PME) bit is set to ‘1’ (parity function enabled):</p> <ul style="list-style-type: none"> • A parity error flag is set in bit 7 of the CAN Parity Error Control Register • A parity error interrupt is generated (providing the ParIntEn (PIE) bit is asserted) • The address where a parity error occurs is captured in the CANi Parity Error Capture Address Register. <p>When parity error is detected</p> <p>0: Continue operation mode</p> <p>1: Go to Halt mode</p> |

- Notes:
1. Do not write to this bit in Operation Mode
 2. Write “0” only (writing “1” has no effect)
 3. The software sequence required to set these bits is described in section 47.9, CPU is prevented from writing this bit in operation mode by H/W write protection.

47.2.30 CANi Parity Error Address Capture Register (CiPEACR) (i = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

This register displays the address where the parity error occurred.

<After Reset: H'0000>

| Bit | Symbol | Initial Value | R/W | Description |
|----------|--------|---------------|-----|---|
| 15 to 11 | — | All 0 | R | Reserved bits These bits are always read as 0. The write value should always be 0. Operation is not guaranteed if a value other than 0 is written to these bits. |

| | | | | |
|---------|----|-------|---|---|
| 10 to 0 | PA | All 0 | R | Parity error captured address bits This register displays the address offset from a starting address of Mailbox 0 where parity error is detected. When a parity error is detected, the address in which the error occurred is captured in this register. Only the longword address is shown. The address is shown as below. |
|---------|----|-------|---|---|

| ParAddress value | Location |
|------------------|--------------------|
| H'000 - H'00F | Mailbox 0* |
| H'010 - H'01F | Mailbox 1 |
| H'020 - H'02F | Mailbox 2 |
| ... | ... |
| H'3F0 - H'3FF | Mailbox 63 |
| H'400 - H'41F | CiMKR 2 to 9 |
| H'420 - H'427 | FIFO ID 0 to 1 |
| H'428 - H'42B | Mask Invalid 1 |
| H'42C - H'42F | Interrupt enable 1 |
| H'430 - H'433 | CiMKR 0 |
| H'434 - H'437 | CiMKR 1 |
| H'438 - H'43B | Mask Invalid 0 |
| H'43C - H'43F | Interrupt enable 0 |

Note: * H'000 is the first byte of the mailbox 0.

Only the address related to the first parity error is reported. The program has to clear the ParFlag status to enable the capture of other locations leading to a parity error.

In case parity error is flagged at the same time from DPRAM CAN side parity checker and the DPRAM CPU side parity checker, the CPU side access address will be displayed in the parity error address capture register.

47.3 Operating Mode

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

The CAN module has the following four operating modes.

- CAN reset mode
- CAN halt mode
- CAN operation mode
- CAN sleep mode

Figure 47.9 shows the transition between CAN operating modes.

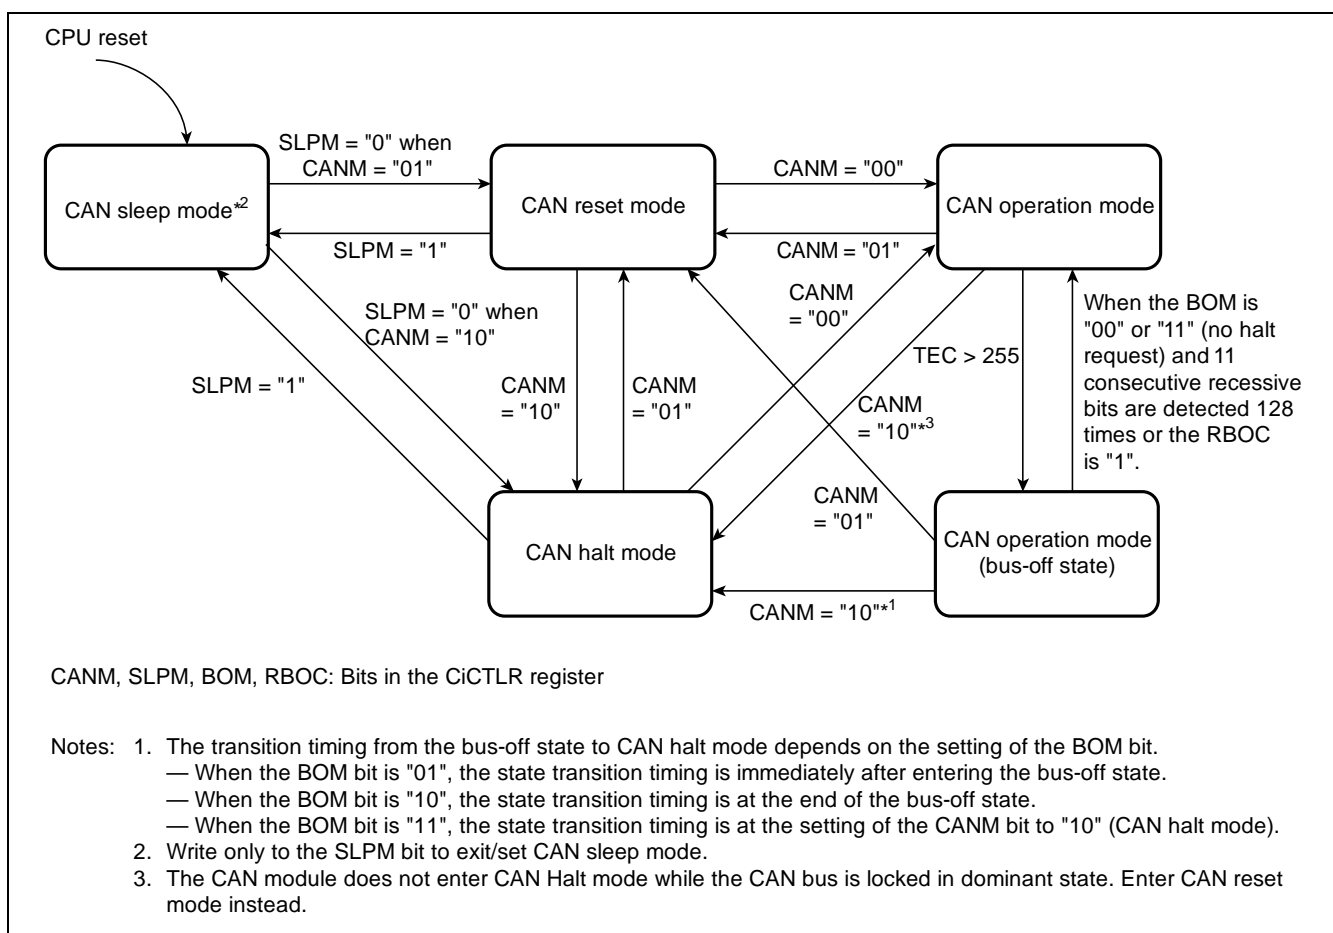

Figure 47.9 Transition between CAN Operating Modes (i = 0, 1)

47.3.1 CAN Reset Mode

CAN reset mode is provided for CAN communication configuration.

When the CANM bit in the CiCTLR register is set to "01" or "11", the CAN module enters CAN reset mode. Then the RSTST bit in the CiSTR register is set to "1". Do not change the CANM bit until the RSTST bit is set to "1". Configure the CiBCR register before exiting CAN reset mode to any other modes.

The following registers are initialized to their reset values after entering CAN reset mode and their initialized values are retained during CAN reset mode:

- CiMCTLj register
- CiSTR register (except bits SLPST and TFST)
- CiEIFR register
- CiRECR register
- CiTECR register
- CiTSR register
- CiMSSR register
- CiMSMR register
- CiRFCR register
- CiTFCR register
- CiTCR register
- CiECSR register (except EDPM bit)
- CiISR register
- CiMBSMR register

The following registers retain their values after entering CAN reset mode.

- CiCLKR register
- CiCTLR register
- CiSTR register (bits SLPST and TFST)
- Registers CiMIER0 and CiMIER1
- CiEIER register
- CiBCR register
- CiCSSR register
- CiECSR register (EDPM bit only)
- CiMBj register
- Registers CiMKR0 to CiMKR9
- Registers CiFIDCR0 and CiFIDCR1
- Registers CiMKIVLR0 and CiMKIVLR1
- CiAFSR register
- CiRFPCR register
- CiTFPCR register
- CiIER register

47.3.2 CAN Halt Mode

CAN halt mode is used for mailbox configuration and test mode setting.

When the CANM bit in the CiCTRL register is set to "10", CAN halt mode is selected. Then the HLTST bit in the CiSTR register is set to "1". Do not change the CANM bit until the HLTST bit is set to "1".

Refer to Table 47.10, Operation in CAN Reset Mode and CAN Halt Mode regarding the state transition conditions when transmitting or receiving.

All registers except bits RSTST, HLTST, and SLPST in the CiSTR register remain unchanged when the CAN module enters CAN halt mode.

Do not change registers CiCLKR, CiCTRL (except bits CANM and SLPM), and CiEIER in CAN halt mode. The CiBCR register can be changed in CAN halt mode only when listen-only mode is selected to use for automatic bit rate detection.

Table 47.10 Operation in CAN Reset Mode and CAN Halt Mode

| Mode | Receiver | Transmitter | Bus-Off |
|----------------|---|---|--|
| CAN reset mode | CAN module enters CAN reset mode without waiting for the end of message reception | CAN module enters CAN reset mode after waiting for the end of message transmission (1, 4) | CAN module enters CAN reset mode without waiting for the end of bus-off recovery |
| CAN halt mode | CAN module enters CAN halt mode after waiting for the end of message reception (2, 3) | CAN module enters CAN halt mode after waiting for the end of message transmission (1, 2, 4) | <ul style="list-style-type: none"> When the BOM bit is "B'00" A halt request from a program will be acknowledged only after bus-off recovery When the BOM bit is "B'01" CAN module automatically enters CAN halt mode without waiting for the end of bus-off recovery (regardless of a halt request from a program) When the BOM bit is "B'10" CAN module automatically enters CAN halt mode after waiting for the end of bus-off recovery (regardless of a halt request from a program) When the BOM bit is "B'11" CAN module enters CAN halt mode (without waiting for the end of bus-off recovery) if a halt is requested by a program during bus-off |

BOM bit: Bit in the CiCTRL register (i = 0, 1)

- Notes:
- If several messages are requested to be transmitted, mode transition occurs after the completion of the first message transmission. When CAN reset mode is being requested during suspend transmission, mode transition occurs when the bus is idle, the next transmission ends, or the CAN module becomes a receiver.
 - If the CAN bus is locked in dominant state, the program can detect this state by monitoring the BLIF bit in the CiEIFR register. The CAN module does not enter CAN Halt mode while the CAN bus is locked in dominant state. Enter CAN reset mode instead.
 - If a CAN bus error occurs during reception after CAN halt mode is requested, the CAN module enters CAN halt mode. However, the CAN module does not enter CAN Halt mode when the CAN bus is locked in dominant state.
 - If a CAN bus error or arbitration lost occurs during transmission after CAN reset mode or CAN halt mode is requested, the CAN module enters the requested operating mode. However, the CAN module does not enter CAN Halt mode when the CAN bus is locked in dominant state.

47.3.3 CAN Sleep Mode

CAN sleep mode is used for reducing current consumption by stopping the clock supply to the CAN module. After MCU hardware reset or software reset, the CAN module starts from CAN sleep mode.

When the SLPM bit in the CiCTLR register is set to "1", the CAN module enters CAN sleep mode. Then the SLPST bit in the CiSTR register is set to "1". Do not change the value of the SLPM bit until the SLPST bit is set to "1". The other registers remain unchanged when the MCU enters CAN sleep mode.

Write to the SLPM bit in CAN reset mode and CAN halt mode. Do not change any registers (except the SLPM bit) during CAN sleep mode. Read operation is still allowed. When the SLPM bit is set to "0", the CAN module is released from CAN sleep mode. When the CAN module exits CAN sleep mode, the other registers remain unchanged.

47.3.4 CAN Operation Mode (Excluding Bus-Off State)

CAN operation mode is used for CAN communication.

When the CANM bit in the CiCTLR register is set to "B'00", the CAN module enters CAN operation mode.

Then bits RSTST and HLTST in the CiSTR register are set to "0". Do not change the value of the CANM bit until these bits are set to "0".

If 11 consecutive recessive bits are detected after entering CAN operation mode, the CAN module is in the following states:

- The CAN module becomes an active node on the network that enables transmission and reception of CAN messages.
- Error monitoring of the CAN bus, such as receive and transmit error counters, is performed.

During CAN operation mode, the CAN module may be in one of the following three sub-modes, depending on the status of the CAN bus:

- Idle mode: Transmission or reception is not being performed.
- Receive mode: A CAN message sent by another node is being received.
- Transmit mode: A CAN message is being transmitted. The CAN module may receive its own message simultaneously when self-test mode 0 (TSTM bit in the CiTCR register = "B'10") or self-test mode 1 (TSTM bit = "B'11") is selected.

Figure 47.10 shows the sub mode in CAN operation mode.

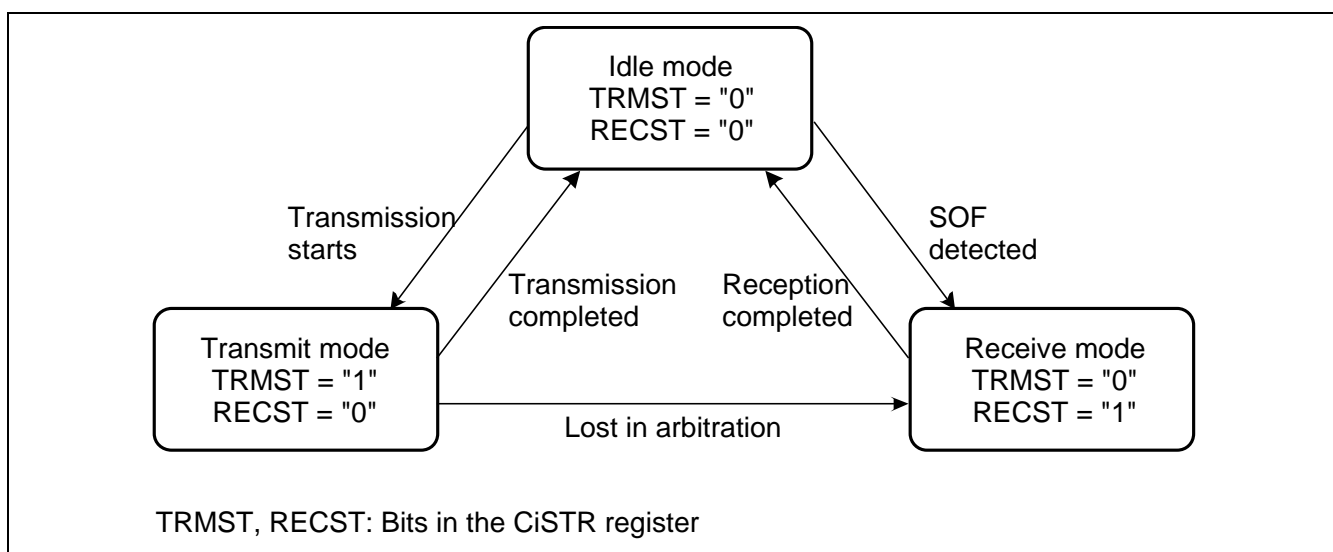

Figure 47.10 Sub Mode in CAN Operation Mode (i = 0, 1)

47.3.5 CAN Operation Mode (Bus-Off State)

The CAN module enters the bus-off state according to the increment/decrement rules for the transmit/error counters in the CAN Specifications.

The following cases apply when recovering from the bus-off state. When the CAN module is in bus-off state, the values of the associated registers, except registers CiSTR, CiEIFR, CiRECR, CiTECR and CiTSR, remain unchanged.

1. When the BOM bit in the CiCTLR register is "B'00" (normal mode)

The CAN module enters the error-active state after it has completed the recovery from the bus-off state and CAN communication is enabled instantly. The BORIF bit in the CiEIFR register is set to "1" (bus-off recovery detected) at this time.

2. When the RBOC bit in the CiCTLR register is set to "1" (forcible return from bus-off)

The CAN module enters the error-active state when it is in bus-off state and the RBOC bit is set to "1". CAN communication is enabled again after 11 consecutive recessive bits are detected. The BORIF bit is not set to "1" at this time.

3. When the BOM bit is "B'01" (entry to CAN halt mode automatically at bus-off entry)

The CAN module enters CAN halt mode when it reaches the bus-off state. The BORIF bit is not set to "1" at this time.

4. When the BOM bit is "B'10" (entry to CAN halt mode automatically at bus-off end)

The CAN module enters CAN halt mode when it has completed the recovery from bus-off. The BORIF bit is set to "1" at this time.

5. When the BOM bit is "B'11" (entry to CAN halt mode by a program) and the CANM bit in the CiCTLR register is set to "B'10" (CAN halt mode) during the bus-off state

The CAN module enters CAN halt mode when it is in bus-off state and the CANM bit is set to "B'10" (CAN halt mode). The BORIF bit is not set to "1" at this time.

If the CANM bit is not set to "B'10" during bus-off, the same behavior as (1) applies.

47.4 CAN Communication Speed Configuration

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

The following description explains about the CAN communication speed configuration.

47.4.1 CAN Clock Configuration

This MCU has a CAN clock selector. The CAN clock can be configured by setting the CCLKS bit in the CiCLKR register and the BRP bit in the CiBCR register.

Figure 47.11 shows the block diagram of CAN clock generator.

Figure 47.11 Block Diagram of CAN Clock Generator (i = 0, 1)

The CAN operating clock can be selected from the internal clock (clkp1, clkp2) from the CPG (PLL), and the external clock input to external pin (CAN_CLK).

In the initial state, clkp1 is selected. If an external clock input is to be selected, set the CiCLKR register (section 47.2.2) before accessing the CAN module. The range of frequencies that may be input as an external clock is 8 to 50 MHz.

47.4.2 Bit Timing Configuration

The bit time is a single bit time for transmitting/receiving a message and consists of the following three segments.

Figure 47.12 shows the bit timing.

Figure 47.12 Bit Timing

47.4.3 Bit-rate

The bit rate depends on the division value of the fCAN (CAN clock source), the division value of the baud rate prescaler, and the number of Tq of one bit time.

$$\text{Bit rate [bps]} = \frac{f_{CAN}}{\text{Baud rate prescaler division value}^* \times \text{number of Tq of one bit time}} = \frac{f_{CANCLK}}{\text{Number of Tq of one bit time}}$$

Note: * Division value of the baud rate prescaler = P + 1 (P: 0 to 1023)

P: Setting value of the BRP bit in the CiBCR register (i = 0, 1)

Table 47.11 lists bit rate examples.

Table 47.11 Example of Bit-rate

| fCAN | 40 MHz | | 32 MHz | | 20 MHz | | 16 MHz | |
|-----------|-----------|-------|-----------|-------|-----------|-------|-----------|-------|
| | No. of Tq | P + 1 | No. of Tq | P + 1 | No. of Tq | P + 1 | No. of Tq | P + 1 |
| 1 Mbps | 10Tq | 4 | 8Tq | 4 | 10Tq | 2 | 8Tq | 2 |

47.5 Mailbox and Mask Register Structure

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

Figure 47.13 shows the structure of the CiMBj register.

There are 64 mailboxes with the same structure.

Figure 47.13 Structure of CiMBj Register (i = 0, 1; j = 0 to 63)

Figure 47.14 shows the structure of registers CiMKR0, CiMKR1, and CiMKR2 to CiMKR9.

There are 10 mask registers with the same structure.

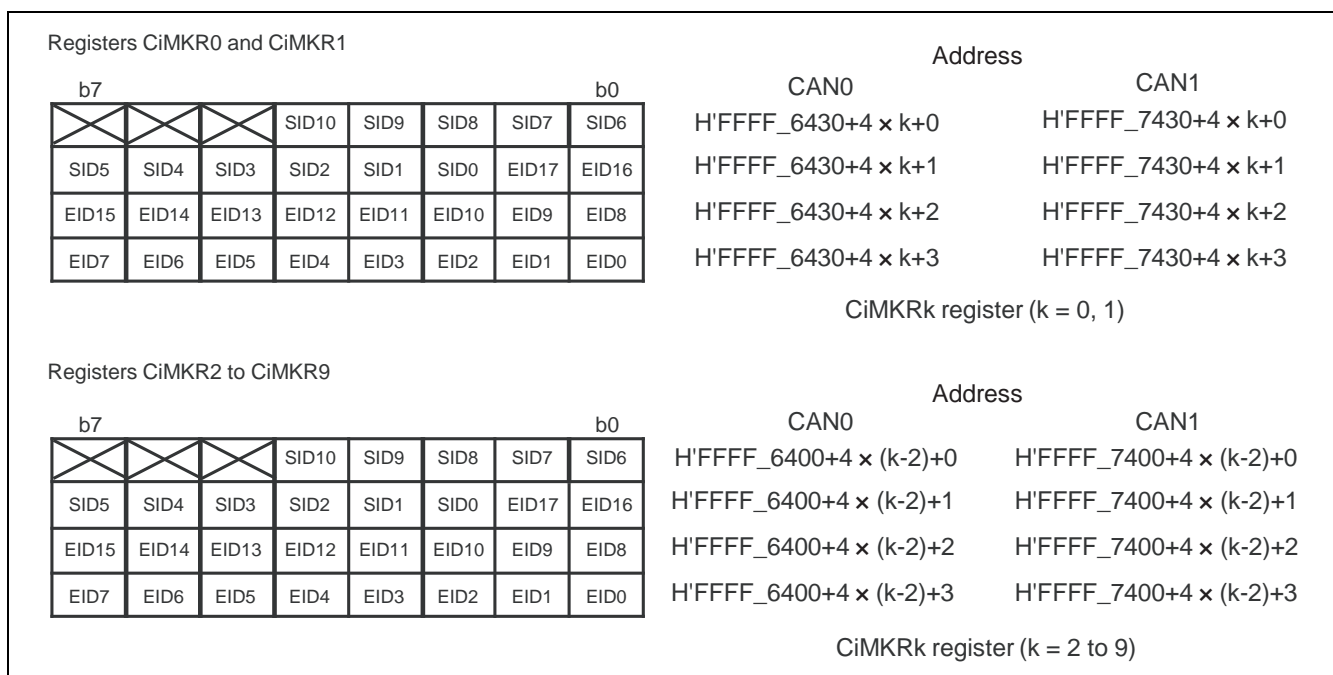

Figure 47.14 Structure of CiMKRk Register (i = 0, 1; k = 0 to 9)

Figure 47.15 shows the structure of the CiFIDCRn register.

There are 2 FIFO received ID compare registers with the same structure.

Figure 47.15 Structure of CiFIDCRn register (i = 0, 1; n = 0, 1)

47.6 Acceptance Filtering and Masking Function

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

Acceptance filtering allows the user to receive messages with a specified range of multiple IDs for mailboxes. Registers CiMKR0 to CiMKR9 can perform masking of the standard ID and the extended ID of 29 bits.

- The CiMKR0 register corresponds to mailboxes [0] to [15].
- The CiMKR1 register corresponds to mailboxes [16] to [31].
- The CiMKR2 register corresponds to mailboxes [32] to [35].
- The CiMKR3 register corresponds to mailboxes [36] to [39].
- The CiMKR4 register corresponds to mailboxes [40] to [43].
- The CiMKR5 register corresponds to mailboxes [44] to [47].
- The CiMKR6 register corresponds to mailboxes [48] to [51].
- The CiMKR7 register corresponds to mailboxes [52] to [55].
- The CiMKR8 register corresponds to mailboxes [56] to [59] in normal mailbox mode and the receive FIFO mailboxes [60] to [63] in FIFO mailbox mode.
- The CiMKR9 register corresponds to mailboxes [60] to [63] in normal mailbox mode and the receive FIFO mailboxes [60] to [63] in FIFO mailbox mode.

Registers CiMKIVLR0 and CiMKIVLR1 disable acceptance filtering individually for each mailbox.

The IDE bit in the CiMBj register is enabled when the ID bit in the CiCTRL register is "B'10" (mixed ID mode).

The RTR bit in the CiMBj register selects a data frame or a remote frame.

In FIFO mailbox mode, normal mailboxes (mailboxes [0] to [55]) use the single corresponding register among registers CiMKR0 to CiMKR7 for acceptance filtering. Receive FIFO mailboxes (mailboxes [60] to [63]) use two registers CiMKR8 and CiMKR9 for the acceptance filtering.

Also, the receive FIFO uses two registers CiFIDCR0 and CiFIDCR1 for ID comparison. Bits EID, SID, RTR, and IDE in registers CiMB60 to CiMB63 for the receive FIFO are disabled. As acceptance filtering depends on the result of two ID-mask sets, two ranges of IDs can be received into the receive FIFO.

Registers CiMKIVLR0 and CiMKIVLR1 are disabled for the receive FIFO.

If both setting of standard ID and extended ID are set in the IDE bits in registers CiFIDCR0 and CiFIDCR1 individually, both ID formats are received.

If both setting of data frame and remote frame are set in the RTR bits in registers CiFIDCR0 and CiFIDCR1 individually, both data and remote frames are received.

When combination with two ranges of IDs is not necessary, set the same mask value and the same ID into both of the FIFO ID/mask register sets.

Figure 47.16 shows the correspondence of mask registers to mailboxes. Figure 47.17 shows the acceptance filtering.

Figure 47.16 Correspondence of Mask Registers to Mailboxes (i = 0, 1)

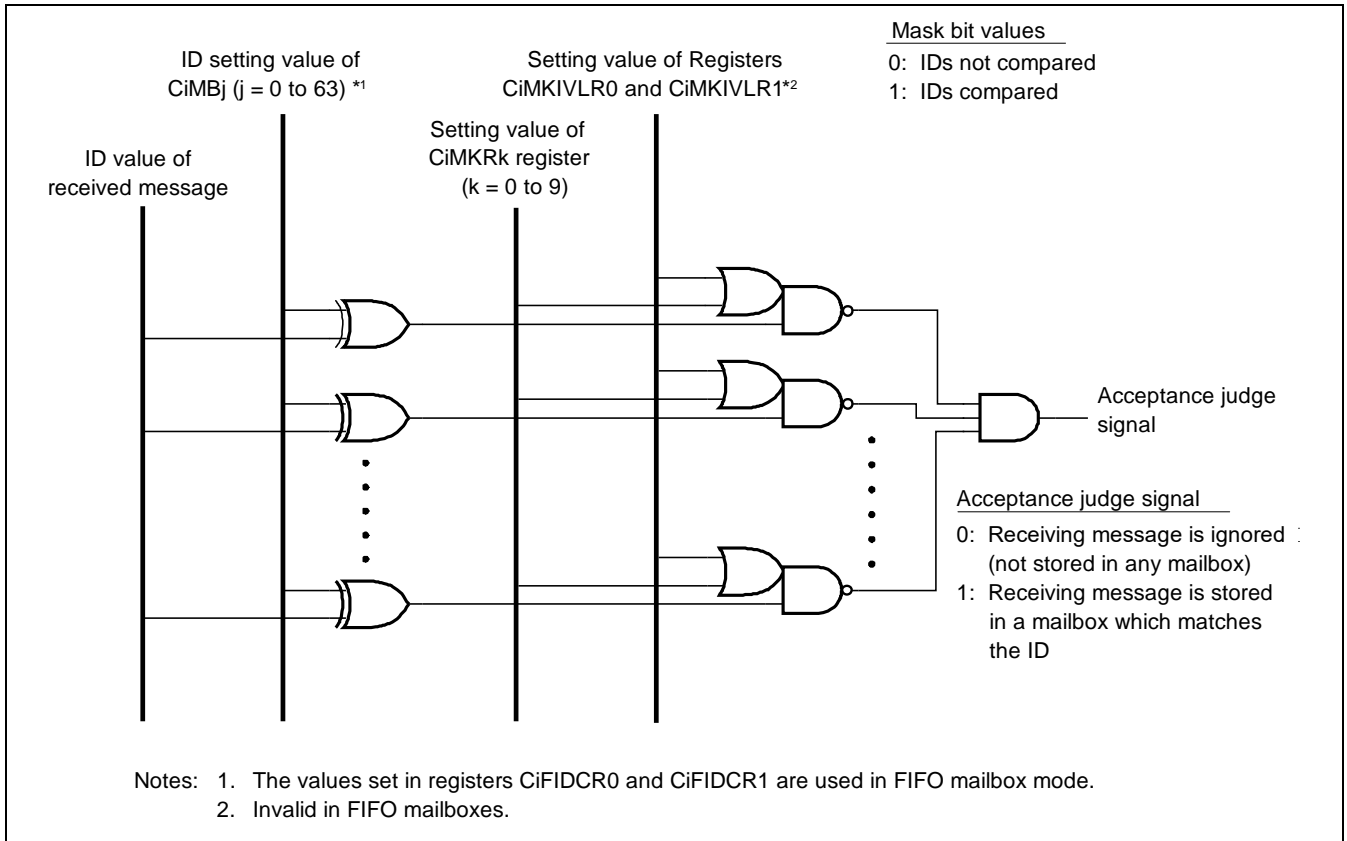

Figure 47.17 Acceptance Filtering (i = 0, 1)

47.7 Reception and Transmission

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

Table 47.12 lists the CAN communication mode configuration.

Table 47.12 Configuration for CAN Reception Mode and Transmission Mode

| TRMREQ | RECREQ | ONESHOT | Communication Mode of Mailbox |
|--------|--------|---------|---|
| 0 | 0 | 0 | Mailbox disabled or transmission being aborted |
| 0 | 0 | 1 | Configurable only when transmission or reception from a mailbox (programmed in one-shot mode) is aborted. |
| 0 | 1 | 0 | Configured as a receive mailbox for a data frame or a remote frame. |
| 0 | 1 | 1 | Configured as a one-shot receive mailbox for a data frame or a remote frame. |
| 1 | 0 | 0 | Configured as a transmit mailbox for a data frame or a remote frame. |
| 1 | 0 | 1 | Configured as a one-shot transmit mailbox for a data frame or a remote frame. |
| 1 | 1 | 0 | Do not set. |
| 1 | 1 | 1 | Do not set. |

Note: TRMREQ, RECREQ, ONESHOT: Bits in CiMCTLj register (i = 0, 1; j = 32 to 63)

When a mailbox is configured as a receive mailbox or a one-shot receive mailbox, note the following:

1. Before a mailbox is configured as a receive mailbox or a one-shot receive mailbox, set the CiMCTLj register to "H'00".
2. A received message is stored into the first mailbox that matches the condition according to the result of receive mode configuration and acceptance filtering. Upon deciding a mailbox which stores the received message, the mailbox with the smaller number has higher priority.
3. In CAN operation mode, when a CAN module transmits a message whose ID matches with the ID/mask set of a mailbox configured to receive messages, the CAN module never receives the transmitted data. In self-test mode, however, the CAN module may receive its transmitted data. In this case, the CAN module sends an ACK.

When configuring a mailbox as a transmit mailbox or a one-shot transmit mailbox, note the following:

1. Before a mailbox is configured as a transmit mailbox or one-shot transmit mailbox, ensure that the CiMCTLj register is "H'00" and that there is no pending abort process.

47.7.1 Reception

Figure 47.18 shows an operation example of data frame reception in overwrite mode.

This example shows the operation of overwriting the first message when the CAN module receives two consecutive CAN messages that matches the receiving conditions of the CiMCTLj register.

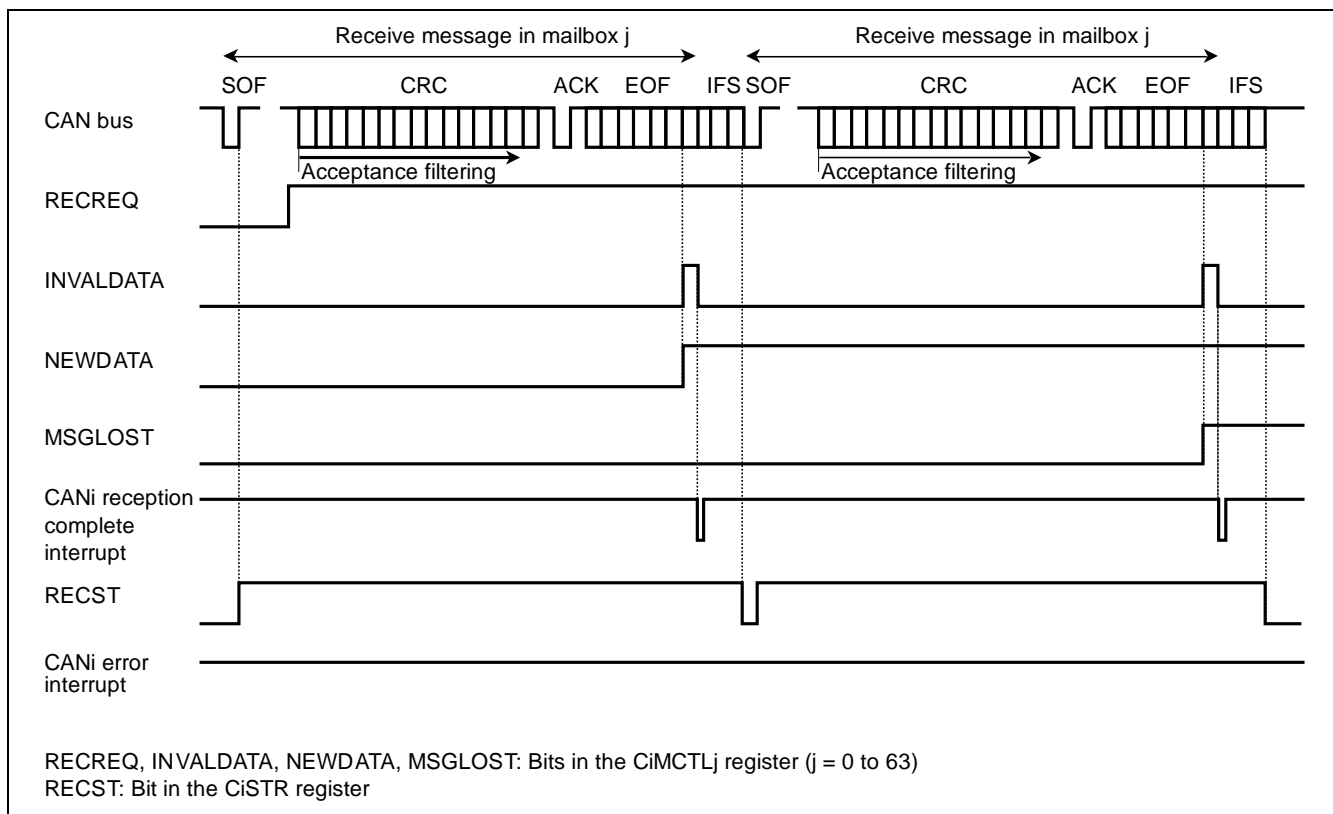

Figure 47.18 Operation Example of Data Frame Reception in Overwrite Mode (i = 0, 1)

1. When a SOF is detected on the CAN bus, the RECST bit in the CiSTR register is set to "1" (reception in progress) if the CAN module has no message ready to start transmission.
2. The acceptance filter procedure starts at the beginning of the CRC field to select the receive mailbox.
3. After a message has been received, the NEWDATA bit in the CiMCTLj register for the receive mailbox is set to "1" (new data being updated/stored in the mailbox). The INVALIDDATA bit in the CiMCTLj register is set to "1" (message is being updated) at the same time, and then the INVALIDDATA bit is set to "0" (message valid) again after the complete message is transferred to the mailbox.
4. When the interrupt enable bit in the CiMIER register for the receive mailbox is "1" (interrupt enabled), the CANi reception complete interrupt request is generated. This interrupt is generated when the INVALIDDATA bit is set to "0".
5. After reading the message from the mailbox, the NEWDATA bit needs to be set to "0" by a program.
6. In overwrite mode, if the next CAN message has been received into a mailbox whose NEWDATA bit is still set to "1", the MSGLOST bit in the CiMCTLj register is set to "1" (message has been overwritten). The new received message is transferred to the mailbox. The CANi reception complete interrupt request is generated the same as in 4.

Figure 47.19 shows the operation example of data frame reception in overrun mode. This example shows the operation of overrunning the second message when the CAN module receives two consecutive CAN messages that matches the receiving conditions of the CiMCTLj register.

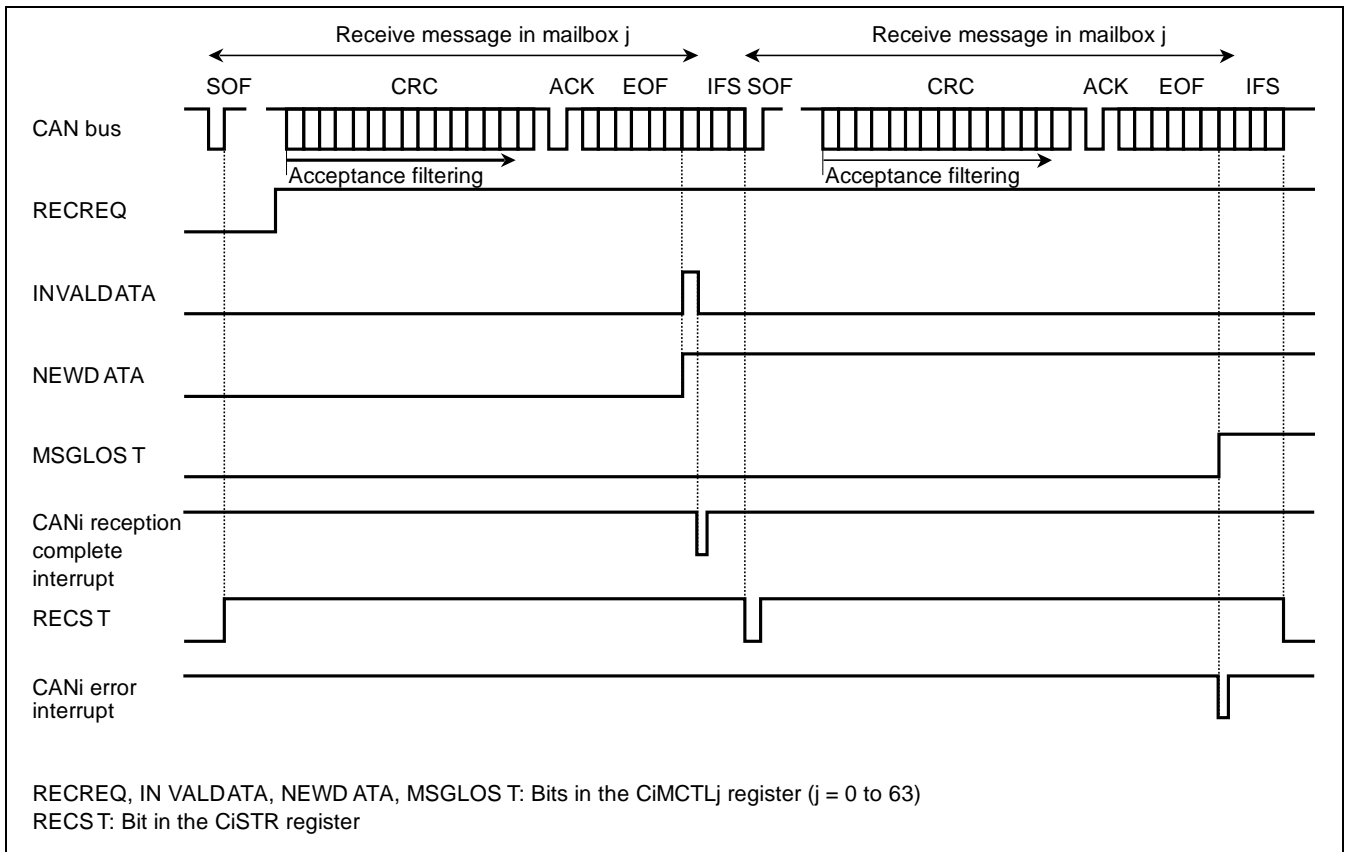

Figure 47.19 Operation Example of Data Frame Reception in Overrun Mode (i = 0, 1)

1. to 5. are the same as overwrite mode.
6. In overrun mode, if the next message has been received before the NEWDATA bit is set to "0", the MSGLOST bit in the CiMCTLj register is set to "1" (message has been overrun). The new received message is discarded and a CANi error interrupt request is generated if the corresponding interrupt enable bit in the CiEIER register is set to "1" (interrupt enabled).

47.7.2 Transmission

Figure 47.20 shows an operation example of data frame transmission.

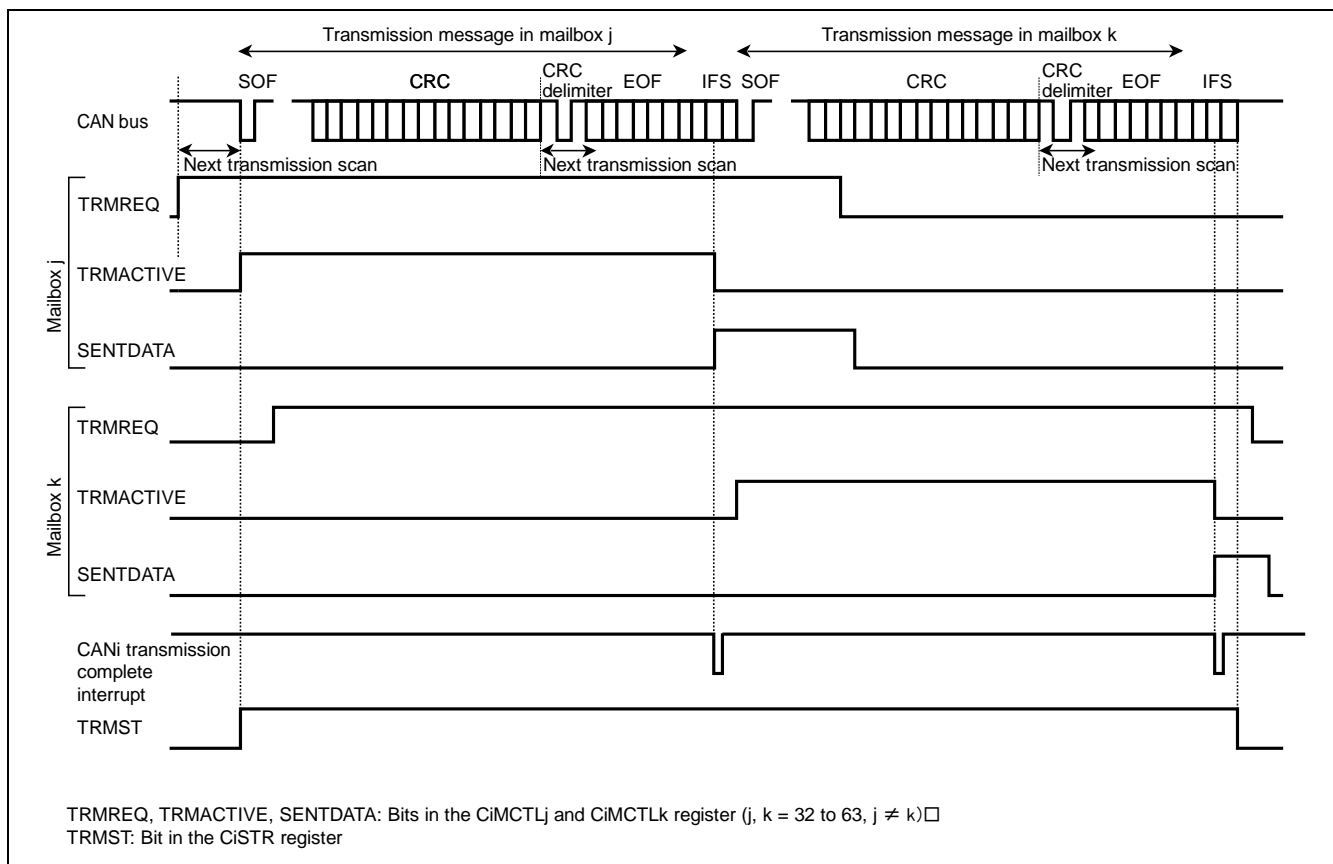

Figure 47.20 Operation Example of Data Frame Transmission (i = 0, 1)

1. When a TRMREQ bit in the CiMCTLj register is set to 1 (transmit mailbox) in bus-idle state, the mailbox scan procedure starts to decide the highest-priority mailbox for transmission. Once the transmit mailbox is decided, the TRMACTIVE bit in the CiMCTLj register is set to "1" (from when a transmission request is received until transmission is completed, or an error/arbitration lost has occurred), the TRMST bit in the CiSTR register is set to "1" (transmission in progress), and the CAN module starts transmission.*
2. If other TRMREQ bits are set, the transmission scan procedure starts with the CRC delimiter for the next transmission.
3. If transmission is completed without losing arbitration, the SENDTDATA bit in the CiMCTLj register is set to "1" (transmission completed) and the TRMACTIVE bit is set to "0" (transmission is pending, or no transmission request). If the interrupt enable bit in the CiMIER register is "1" (interrupt enabled), the CANi transmission complete interrupt request is generated.
4. When requesting the next transmission from the same mailbox, set bits SENDTDATA and TRMREQ to "0", then set the TRMREQ bit to "1" after checking that bits SENDTDATA and TRMREQ have been set to "0".

Note: * If arbitration is lost after the CAN module starts transmission, the TRMACTIVE bit is set to "0". The transmission scan procedure is performed again to search for the highest-priority transmit mailbox from the beginning of the CRC delimiter. If an error occurs either during transmission or following the arbitration lost the transmission scan procedure is performed again from the start of the error delimiter to search for the highest-priority transmit mailbox.

47.8 CAN Interrupt

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

The CAN module provides the following CAN interrupts for each channel. Table 47.13 lists CAN interrupts.

- CANi reception complete interrupt (mailbox 0) [RXM0i]
- CANi reception complete interrupt (mailbox 1 to 63) [RXM1i]
- CANi transmission complete interrupt (mailbox 32 to 63) [TXMi]
- CANi reception FIFO interrupt [RXFi]
- CANi transmission FIFO interrupt [TXFi]
- CANi error interrupt [ERSi]

There are eight types of interrupt sources for the CANi error interrupts. These sources can be determined by checking the CiEIFR register.

- Bus error
- Error-warning
- Error-passive
- Bus-off entry
- Bus-off recovery
- Receive overrun
- Overload frame transmission
- Bus lock

Table 47.13 CAN Interrupts

| Module | Interrupt Symbol | Interrupt Source | Source Flag |
|--------|------------------|--|--|
| CANi | ERSi | Bus lock detected | CiEIFR.BLIF |
| | | Overload frame transmission detected | CiEIFR.OLIF |
| | | Overrun detected | CiEIFR.ORIF |
| | | Bus-off recovery detected | CiEIFR.BORIF |
| | | Bus-off entry detected | CiEIFR.BOEIF |
| | | Error-passive detected | CiEIFR.EPIF |
| | | Error-warning detected | CiEIFR.EWIF |
| | | Bus error detected | CiEIFR.BEIF |
| RXFi | RXFi | Receive FIFO message received (CiMIER1[29] = 0) | CiISR.RXFF |
| | | Receive FIFO warning (CiMIER1[29] = 1) | |
| TXFi | TXFi | Transmit FIFO message transmission completed (CiMIER1[25] = 0) | CiISR.TXFF |
| | | FIFO last message transmission completed (CiMIER1[25] = 1) | |
| RXM0i | RXM0i | Mailbox 0 message received | CiMCTL0.NEWDATA |
| RXM1i | RXM1i | Mailbox 1 to 63 message received | CiMCTL1.NEWDATA to CiMCTL63.NEWDATA |
| TXMi | TXMi | Mailbox 32 to 63 message transmission completed | CiMCTL32.SENTDATA to CiMCTL63.SENTDATA |

Legend: i = 0, 1

(1) CANi reception complete interrupt (mailbox 0) [RXM0i]

After the CiMCTL0.NEWDATA bit is set by the completion of reception, if received data has been stored (the corresponding INVALIDDATA bit changes from "1" to "0"), the CiISR.RXM0F bit is set to "1" when CiMIER0[0] has been set to "1". When the mailbox 0 reception complete (RXM0) interrupt has been enabled, the RXM0 interrupt is requested to the interrupt controller.

To clear the RXM0 interrupt, clear the CiMCTL0.NEWDATA bit in the RXM0 interrupt handling routine. To change the CiIER.RXM0IE bit to disabled after having set the bit, make the change while no RXM0 interrupt is generated or during the RXM0 interrupt handling routine. This also applies to CiMIER0[0].

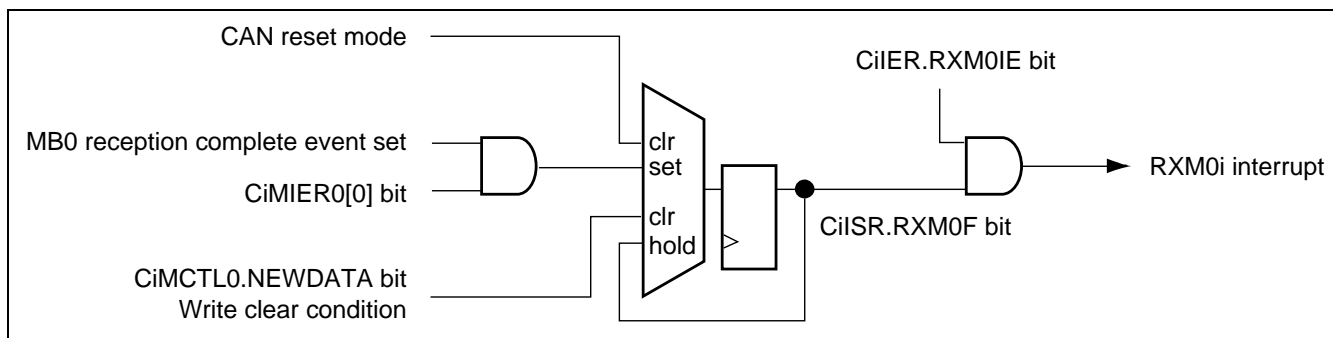

Figure 47.21 Block Diagram of CANi Reception Complete Interrupt (Mailbox 0) [RXM0i]

(2) CANi reception complete interrupt (mailbox 1 to 63) [RXM1i]

After the CiMCTLj.NEWDATA bit is set by the completion of reception, if received data has been stored (the corresponding INVALIDDATA bit changes from "1" to "0"), the CiISR.RXM1F bit is set to "1" when the CiMIER0 or CiMIER1 register bit corresponding to mailbox j has been set to "1". When the mailbox 1 to 63 reception complete (RXM1) interrupt has been enabled, the RXM1 interrupt is requested to the interrupt controller.

To clear the RXM1 interrupt, clear the CiMCTLj.NEWDATA bit in the RXM1 interrupt handling routine. To change the CiIER.RXM1IE bit to disabled after having set the bit, make the change while no RXM1 interrupt is generated or during the RXM1 interrupt handling routine. This also applies to CiMIER0[j] (j = 1 to 31) or CiMIER1[j-32] (j = 32 to 63).

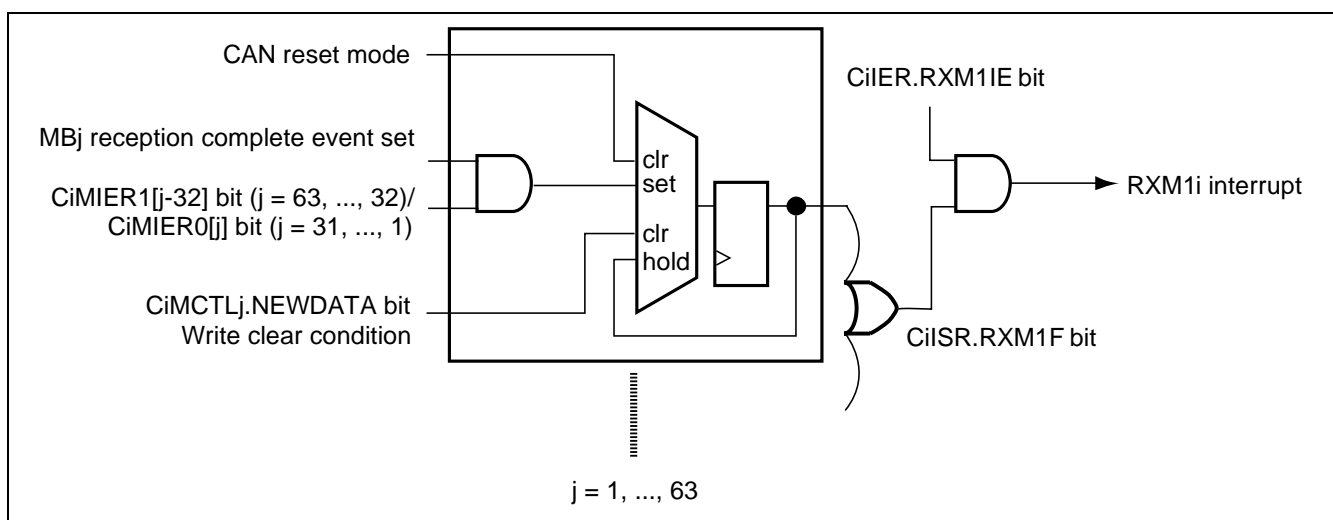

Figure 47.22 Block Diagram of CANi Reception Complete Interrupt (Mailbox 1 to 63) [RXM1i]

(3) CANi transmission complete interrupt (mailbox 32 to 63) [TXMi]

If the CiMCTLj.SENTDATA bit is set by the completion of transmission, the CiISR.TXMF bit is set to "1" when the CiMIER1 register bit corresponding to mailbox j has been set to "1". When the mailbox 32 to 63 transmission complete (TXM) interrupt has been enabled, the TXM interrupt is requested to the interrupt controller.

To clear the TXM interrupt, clear the CiMCTLj.SENTDATA bit in the TXM interrupt handling routine. To change the CiIER.TXMIE bit to disabled after having set the bit, make the change while no TXM interrupt is generated or during the TXM interrupt handling routine. This also applies to CiMIER1[j-32] (j = 32 to 63).

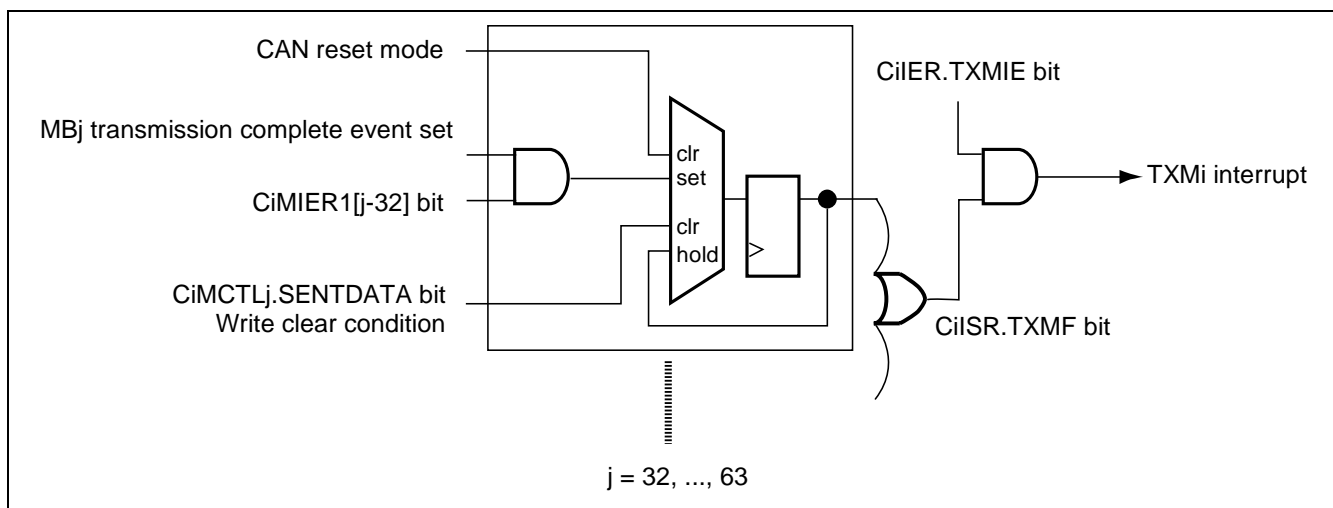

Figure 47.23 Block Diagram of CANi Transmission Complete Interrupt (Mailbox 32 to 63) [TXMi]

(4) CANi receive FIFO interrupt [RXFi]

If CiRFCR[6:5] are set by the reception of a receive FIFO message or by a warning with the settings of CiMIER1[29:28], the CiISR.RXFF bit is set to "1". When the receive FIFO (RXF) interrupt has been enabled with the CiIER.RXFIE bit, the RXF interrupt is requested to the interrupt controller.

To clear the RXF interrupt, clear the CiISR.RXFF bit in the RXF interrupt handling routine. To change the CiIER.RXFIE bit to disabled after having set the bit, make the change while no RXF interrupt is generated or during the RXF interrupt handling routine. This also applies to CiMIER1[28].

Figure 47.24 Block Diagram of CANi Receive FIFO Interrupt [RXFi]

(5) CANi transmit FIFO interrupt [TXFi]

When the transmission of a transmit FIFO message is counted for the specified number of times with the settings of CiMIER1 [25:24], the CiISR.TXFF bit is set to "1". When the transmit FIFO (TXF) interrupt has been enabled with the CiIER.TXFIE bit, the TXF interrupt is requested to the interrupt controller.

To clear the TXF interrupt, clear the CiISR.TXFF bit in the TXF interrupt handling routine. To change the CiIER.TXFIE bit to disabled after having set the bit, make the change while no TXF interrupt is generated or during the TXF interrupt handling routine. This also applies to CiMIER1[24].

Figure 47.25 Block Diagram of CANi Transmit FIFO Interrupt [TXFi]

(6) CANi error interrupt [ERSi]

If CiEIFR[j] is set by a communication error, the CiISR.ERSF bit is set to "1" when the corresponding CiEIER[j] has been set to "1". When the error (ERS) interrupt has been enabled with the CiIER.ERSIE bit, the ERS interrupt is requested to the interrupt controller.

To clear the ERS interrupt, clear each CiEIFR[j] register bit in the ERS interrupt handling routine. To change the CiIER.ERSIE bit to disabled after having set the bit, make the change while no ERS interrupt is generated or during the ERS interrupt handling routine. This also applies to CiEIER[j] (j = 7 to 0).

Figure 47.26 Block Diagram of CANi Error Interrupt [ERSi]

47.9 CAN module can support Parity Check

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

47.9.1 Overview

The Parity bit generator for an Even Parity check is a simple XOR of each bit. Exclusive or (XOR) is represented by "^" as follows.

$$\text{parity}[0] = \text{DataBus}[7:0]$$

$$\text{parity}[1] = \text{DataBus}[15:8]$$

$$\text{parity}[2] = \text{DataBus}[23:16]$$

$$\text{parity}[3] = \text{DataBus}[31:24]$$

The Parity error detection for an Even Parity check is a simple XOR of each bit including the Parity bit. In case the result is equal to the Data Byte no error is generated. The detection logic is only working during read access for the selected byte.

$$\text{parity_error}[0] = \{ \text{DataBus}[7:0] \} \wedge \text{parity}[0]$$

$$\text{parity_error}[1] = \{ \text{DataBus}[15:8] \} \wedge \text{parity}[1]$$

$$\text{parity_error}[2] = \{ \text{DataBus}[23:16] \} \wedge \text{parity}[2]$$

$$\text{parity_error}[3] = \{ \text{DataBus}[31:24] \} \wedge \text{parity}[3]$$

Each memory location in the DPRAM consists of 36 bits. 32 bits are used for storage of user data. For each byte of a longword memory location a parity bit is allocated. The value of this parity bit is calculated by the parity generation logic for each byte and both data byte and parity bit are stored in memory during the same write access. The alignment of data bytes and corresponding parity bits in each memory location is shown in the following diagram:

Figure 47.27 Parity bit alignment

47.9.2 Recommend Usage

In order to use this function, refer to 47.2.29 (Parity Error Control Register (CiPECR) (i = 0, 1)) to know how to enable this function.

47.9.3 Failure Control

When parity error detected, an interrupt request is issued to Interrupt handle is obtained.

48. CAN-FD

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

This section contains a generic description of the CANFD interface (RS-CANFD).

The first part of this section describes all specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

48.1 Overview

48.1.1 Functional Overview

Table 48.1 shows the RS-CANFD module specifications. Figure 48.1 shows the RS-CANFD module block diagram.

Table 48.1 RS-CANFD Module Specifications

| Item | Specification |
|---------------------|--|
| Number of channels | |
| Protocol | ISO11898-1 compliant Use of CAN FD frames can be selected by switching the interface modes. |
| Communication speed | <p>Classical CAN mode:</p> <p>Maximum 1 Mbps</p> $\text{Communication speed (CANm bit time clock)} = \frac{1}{\text{CANm bit time}}$ $\text{CANm bit time} = \text{CANmTq} \times \text{Tq count per bit}$ $\text{CANmTq} = \frac{(\text{BRP}[9:0] \text{ bits in the RSCFDnCmCFG register} + 1)}{f_{\text{CAN}}}$ <p>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnGCFG register)</p> <p>CAN FD mode:</p> <p>Normal bit rate: 1 Mbps (max.), Data bit rate: 8 Mbps (max.)</p> $\text{Communication speed (CANm normal bit time clock)} = \frac{1}{\text{CANm normal bit time}}$ $\text{Communication speed (CANm data bit time clock)} = \frac{1}{\text{CANm data bit time}}$ $\text{CANm normal bit time} = \text{CANmTq(N)} \times \text{Tq count per normal bit}$ $\text{CANm data bit time} = \text{CANmTq(D)} \times \text{Tq count per normal bit}$ $\text{CANmTq(N)} = \frac{(\text{NBRP}[9:0] \text{ bits in RSCFDnCFDCmNCFG register} + 1)}{f_{\text{CAN}}}$ $\text{CANmTq(D)} = \frac{(\text{DBRP}[7:0] \text{ bits in RSCFDnCFDCmDCFGregister} + 1)}{f_{\text{CAN}}}$ <p>fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFCFG register)</p> <p>m = 0 or 1</p> <p>Tq: Time quantum</p> |

| Item | Specification |
|-----------------------------------|--|
| Buffer | <ul style="list-style-type: none"> Individual buffers: 32 buffers (16 buffers × 2 channels) Transmit buffer: 16 buffers per channel Transmit FIFO: 3 FIFO per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocated) Shared buffers: 128 buffers for all channels Receive buffer: 32 buffers Receive FIFO: 8 FIFO (up to 128 buffers allocated to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocated to each) ECC included |
| Reception function | <ul style="list-style-type: none"> Receives data frames and remote frames. Selects ID format (standard ID, extended ID, or both IDs) to be received. Sets interrupt enable/disable for each FIFO. Mirror function (reception of messages transmitted from the own CAN node) Timestamp function (to record message reception time as a 16-bit timer value) |
| Reception filter function | <ul style="list-style-type: none"> Selects receive messages according to 1 receive rule. Sets the number of receive rules (0 to 128) for each channel. Acceptance filter processing: Sets ID and mask for each receive rule. DLC filter processing: Enables DLC filter check for each acceptance rule. |
| Receive message transfer function | <ul style="list-style-type: none"> Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer Label addition function Stores label information together with a message in a receive buffer and FIFO buffer. |
| Transmission function | <ul style="list-style-type: none"> Transmits data frames and remote frames. Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. Selects ID priority transmission or transmit buffer number priority transmission. Transmit request can be aborted (possible to confirm with a flag) One-shot transmission function |
| Interval transmission function | Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers) |
| Transmit queue function | Transmits all stored messages according to the ID priority. |
| Transmit history function | Stores the history information of transmission-completed messages Adds the timestamp to the history information (records the 16-bit timer value for the message transmission time). |
| Gateway function | Transmits a received message automatically. |
| Bus off recovery mode selection | Selects the method for returning from bus off state. <ul style="list-style-type: none"> ISO11898-1 compliant Automatic entry to channel halt mode at bus-off entry Automatic entry to channel halt mode at bus-off end Transition to channel standby mode by program request Transition to the error-active state by program request (forcible return from the bus off state) |

| Item | Specification |
|-------------------------|--|
| Error status monitoring | <ul style="list-style-type: none"> Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus dominant lock). Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) Reads the error counter. Monitors DLC errors. |
| Interrupt source | <ul style="list-style-type: none"> Global Interrupts (2 sources) <ul style="list-style-type: none"> Receive FIFO interrupt Global error interrupt Channel interrupts (3 sources/channel) <ul style="list-style-type: none"> CANm transmit interrupt (m = 0 or 1) CANm transmit complete interrupt CANm transmit abort interrupt CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) CANm transmit history interrupt CANm transmit queue interrupt <p>CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)</p> <p>CANm error interrupt</p> |
| CAN stop mode | Reduces power consumption by stopping clock supply to the RS-CANFD module. |
| CAN clock source | <p>Selects the clk_c or the clk_{xincan}.</p> <p>As for the range of operating frequency, see section 48.16.1.3, Setting Communication Speed.</p> |
| Test function | <p>Test function for user evaluation</p> <ul style="list-style-type: none"> Listen-only mode Self-test mode 0 (external loopback) Self-test mode 1 (internal loopback) Limited operation mode RAM test (read/write test) Inter-channel communication test [CRC error test is available] |

48.1.2 Interface Mode

RS-CANFD has the following two interface modes.

- Classical CAN mode: Only classical CAN frames are handled.
- CAN FD mode: both the classical CAN frames and CAN FD frames are handled.

Two modes use different register maps with the same base address, and the register maps are switched by switching the modes.

Interface modes can be switched using the RCMC bit in the RSCFDnCFDGRMCFG register.

48.2 Block Diagram

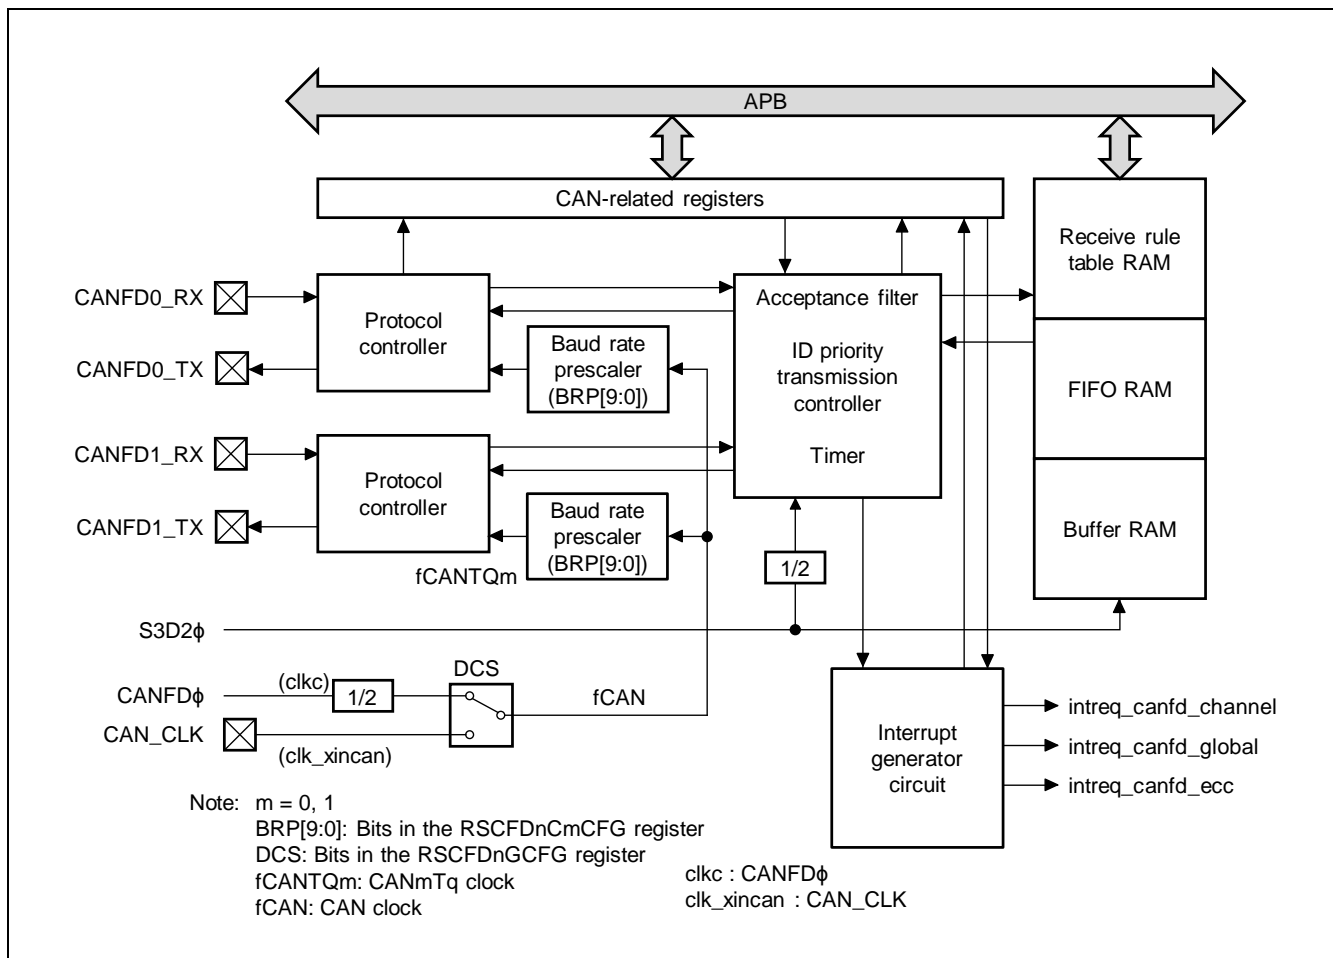

Figure 48.1 RS-CANFD Module Block Diagram (in classical CAN mode)

In CAN FD mode, the specification of the clock to be input to the baud rate prescaler and protocol controller is different from that of the clock in classical CAN mode. Refer to section 48.16.1.3, Setting Communication Speed.

CANFDφ must be set as 80 (MHz).

48.3 External Pins

Table 48.2 shows the CAN module pin.

Pin switching is required for pins which are multiplexed with other Function. For details, see section 8, Pin Function Controller (PFC).

Table 48.2 Pin Configuration

| Name | Abbreviation | I/O | Function | Second Generation RZ/G Series Products | | | |
|-----------|--------------|--------|--|---|----------------------------|--------|--------|
| | | | | RZ/G2H | RZ/G2M V1.3 RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| CANFDi_RX | — | Input | Pins for receiving data | √ | √ | √ | √ |
| CANFDi_TX | — | Output | Pins for transmitting data | √ | √ | √ | √ |
| CAN_CLK | — | Input | Input pin used for external clock input. | √ | √ | √ | √ |

Legend: i = 0 and 1

48.4 Connected module

Table 48.3 Connected module

| Module name | Connected module name | function of the related module |
|-------------|-----------------------|--------------------------------|
| CANFD | AXI | Register access of CPU |
| | CPG | Clock output |
| | PFC | Selection of external pins |
| | Module Standby | Clock stop control |
| | Software Reset | Soft reset execution |
| | INTC | Interruption |
| | SYS-DMAC | DMA transmission |

48.5 Features of RS-CANFD

RS-CANFD has two interface modes (classical CAN mode and CAN FD mode), and uses different registers in each mode. The different register names RSCFDnXXX and RSCFDnCFDXXX are used in the different interface modes (XXX can be any character). In this document, the registers common to the two modes are indicated as RSCFDn(CFD)XXX.

Table 48.4 Index

| Index | Meaning |
|-------|--|
| n | Throughout this section, the individual RS-CANFD units are generically indicated by the index “n” (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit. |
| m | Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index “m” (m = 0, 1); for example, RSCFDn(CFD)CmSTS is the channel m status register. |
| j | The individual registers associated with receive rule table are generically indicated by the index “j” (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register. |
| k | The individual transmit/receive FIFO buffers are generically indicated by the index “k” (k = 0 to [channel m × 3 + 2]); for example, RSCFDn(CFD)CFCK is the transmit/receive FIFO buffer configuration/control register. |
| x | The individual receive FIFO buffers in the RS-CANFD units are identified by the index “x” (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register. |
| d | The individual transmit/receive FIFO buffers are generically indicated by the index “d” (d = 0 to 1 in classical CAN mode, and d = 0 to 15 in CAN FD mode); for example, RSCFDn(CFD)CFDFd_k is the transmit/receive FIFO buffer data field register. |
| q | The individual receive buffers are generically indicated by the index “q” (q = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register. |
| p | The individual transmit buffers are generically indicated by the index “p” (p = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)TMCp is the transmit buffer control register. |
| b | The individual transmit and receive buffers are generically indicated by the index “b” (b = 0 to 1 in classical CAN mode, and b = 0 to 4 in CAN FD mode); for example, RSCFDn(CFD)RMDfb_q is the receive buffer data field register. |
| r | The individual RAM tests for CAN are generically indicated by the index “r” (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register. |
| y | The registers not covered above are indicated by the letter “y” (y = 0); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register. |

Note: The Function and descriptions of registers in this section are for the RS-CANFDs that has 2 channels (m = 0, 1). When referring to information with indices, regard the index values as the ones corresponding to your target product. Also, note that, if the value of an index exceeds the range described in this section due to your target product, write the value after reset when writing to bits outside the index range.

48.5.1 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 48.5 Register Base Address

| Base Address Name | Base Address |
|-------------------|--------------|
| <RSCFD0_base> | H'E66C_0000 |

48.6 Registers Configuration (classical CAN mode)

48.6.1 List of Registers

Table 48.6 lists the RS-CANFD registers used in classical CAN mode.

For details about <RSCFDn_base>, see section 48.5.1, Register Base Address.

Table 48.6 Registers

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | B'0 | R/W | Interface Mode Select Setting this bit to 0 places the CANFD into classical CAN mode. To place the RS-CANFD module from CAN FD mode to classical CAN mode, modify the RSCFDnCFDGRMCFG register after setting the post-reset values to all the registers and bits that are solely assigned to the register map used in CAN FD mode. 0: Classical CAN mode 1: CAN FD mode |

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Also set the register before setting any other RS-CANFD register.

48.7.2 Details of Channel Related Registers

48.7.2.1 RSCFDnCmCFG — Channel Configuration Register (m = 0, 1)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCmCFG register can be read/written in 32-bit units

RSCFDnCmCFGH, RSCFDnCmCFGGL registers can be read/written in 16-bit units

RSCFDnCmCFGLL, RSCFDnCmCFGHL, RSCFDnCmCFGHL, RSCFDnCmCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCmCFG: <RSCFDn_base> + H'0000 + (H'10 × m)

RSCFDnCmCFGH: <RSCFDn_base> + H'0000 + (H'10 × m),

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 31 | Reserved | B'0 | R | This bit is read as the value after reset. The write value should be the value after reset. |
| 30 | CRCT | B'0 | R/W | <p>CRC Error Test Enable</p> <p>This bit is used to test the CRC generator circuit in the RS-CANFD module. Setting this bit to 1 allows the first bit in the ID field to be reversed when a message is received. Due to the bit reversal, the CRC calculation result does not agree with the correct CRC value of the received frame. A CRC error is thus detected (the CERR bit in the RSCFDnCmERFL register is 1). Note the following when using this function:</p> <ul style="list-style-type: none"> This function is available when the CTME bit in the RSCFDnCmCTR register is 1 (communication test mode enabled). Communicating with another CAN node is impossible. Use the function in the inter-channel communication test (the CmICBCE bit in the RSCFDnGTSTCFG register is 1). Bit reversal in the ID field may violate the bit stuffing rule. In this case, a stuff error is detected instead of a CRC error. <p>Modify this bit only in channel standby mode. In channel standby mode, this bit is 0.</p> <p>0: The first bit in the receive ID field is not reversed. 1: The first bit in the receive ID field is reversed.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 29 to 27 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 26, 25 | CTMS[1:0] | B'00 | R/W | Communication Test Mode Select These bits are used to select a communication test mode. Modify these bits only in channel halt mode. These bits are set to 0 in channel reset mode. B'00: Standard test mode B'01: Listen-only mode B'10: Self-test mode 0 (external loopback mode) B'11: Self-test mode 1 (internal loopback mode) |
| 24 | CTME | B'0 | R/W | Communication Test Mode Enable Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode. 0: Communication test mode is disabled. 1: Communication test mode is enabled. |
| 23 | ERRD | B'0 | R/W | Error Display Mode Select This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCmERFL register. When this bit is clear to 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1. When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order. Modify this bit only in channel reset mode or channel halt mode. 0: Error flags are displayed only for the first error information after bits 14 to 8 in RSCFDnCmERFL are all cleared. 1: Error flags for all error information are displayed. |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 22, 21 | BOM[1:0] | B'00 | R/W | <p>Bus Off Recovery Mode Select</p> <p>These bits are used to select the bus off recovery mode of the RS-CANFD module.</p> <p>When the BOM[1:0] bits are set to B'00, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to B'10 (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.</p> <p>When the module reaches the bus off state when the BOM[1:0] bits are set to B'01, the CHMDC[1:0] bits in the RSCFDnCTR register ($m = 0$ or 1) are set to B'10 and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCMSTS register are cleared to H'00.</p> <p>When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to B'10, the CHMDC[1:0] bits are set to B'10 and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H'00.</p> <p>When the BOM[1:0] bits are set to B'11 and the CHMDC[1:0] bits are set to B'10 while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H'00. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to B'10, a bus off recovery interrupt request is generated.</p> <p>If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are B'01 or at bus off end when the BOM[1:0] bits are B'10), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.</p> <p>B'00: ISO11898-1 compliant B'01: Entry to channel halt mode automatically at bus-off entry B'10: Entry to channel halt mode automatically at bus-off end B'11: Entry to channel halt mode (in bus-off state) by program request</p> |
| 20 to 17 | Reserved | All 0 | R | <p>These bits are read as the value after reset.</p> <p>The write value should be the value after reset.</p> |
| 16 | TAIE | B'0 | R/W | <p>Transmit Abort Interrupt Enable</p> <p>When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Transmit abort interrupt is disabled. 1: Transmit abort interrupt is enabled.</p> |

| 15 | ALIE | B'0 | R/W | <p>Arbitration Lost Interrupt Enable</p> <p>When the ALF flag in the RSCFDnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Arbitration lost interrupt is disabled. 1: Arbitration lost interrupt is enabled.</p> |
| 14 | BLIE | B'0 | R/W | <p>Bus Lock Interrupt Enable</p> <p>When the BLF flag in the RSCFDnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Bus lock interrupt is disabled. 1: Bus lock interrupt is enabled.</p> |
| 13 | OLIE | B'0 | R/W | <p>Overload Frame Transmit Interrupt Enable</p> <p>When the OVLF flag in the RSCFDnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Overload frame transmit interrupt is disabled. 1: Overload frame transmit interrupt is enabled.</p> |
| 12 | BORIE | B'0 | R/W | <p>Bus Off Recovery Interrupt Enable</p> <p>When the BORF flag in the RSCFDnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Bus off recovery interrupt is disabled. 1: Bus off recovery interrupt is enabled.</p> |
| 11 | BOEIE | B'0 | R/W | <p>Bus Off Entry Interrupt Enable</p> <p>When the BOEF flag in the RSCFDnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Bus off entry interrupt is disabled. 1: Bus off entry interrupt is enabled.</p> |
| 10 | EPIE | B'0 | R/W | <p>Error Passive Interrupt Enable</p> <p>When the EPF flag in the RSCFDnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Error passive interrupt is disabled. 1: Error passive interrupt is enabled.</p> |
| 9 | EWIE | B'0 | R/W | <p>Error Warning Interrupt Enable</p> <p>When the EWF flag in the RSCFDnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Error warning interrupt is disabled. 1: Error warning interrupt is enabled.</p> |
| 8 | BEIE | B'0 | R/W | <p>Bus Error Interrupt Enable</p> <p>When the BEF flag in the RSCFDnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Bus error interrupt is disabled. 1: Bus error interrupt is enabled.</p> |
| 7 to 4 | Reserved | All 0 | R | <p>These bits are read as the value after reset.</p> <p>The write value should be the value after reset.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|------|------------|---------------|-----|--|
| 3 | RTBO | B'0 | R/W | <p>Forcible Return from Bus-off</p> <p>Setting this bit to 1 in the bus off state forcibly returns the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCmSTS register to H'00 and also clears the BOSTS flag in the RSCFDnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCmCTR are B'00 (ISO11898-1 compliant).</p> <p>A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RS-CANFD module transitions to the error active state. Set this bit to 1 in channel communication mode.</p> |
| 2 | CSLPR | B'1 | R/W | <p>Channel Stop Mode</p> <p>Setting this bit to 1 places the channel into channel stop mode. Clearing this bit to 0 makes the channel exit channel stop mode. This bit should not be modified in channel communication mode or channel wait mode.</p> <p>0: Other than channel stop mode 1: Channel stop mode</p> |
| 1, 0 | CHMDC[1:0] | B'01 | R/W | <p>Mode Select</p> <p>These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see section 48.11.2, Channel Modes. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to B'11.</p> <p>When the RS-CANFD module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits automatically become B'10.</p> <p>B'00: Channel communication mode B'01: Channel reset mode B'10: Channel halt mode B'11: Setting prohibited</p> |

| 6 | BLF | B'0 | R/W* | <p>Bus Lock Flag</p> <p>This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.</p> <ul style="list-style-type: none"> • A recessive bit is detected after the BLF bit has been cleared from 1 to 0. • The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0. <p>0: No channel bus lock is detected.</p> <p>1: Channel bus is lock detected.</p> |
| 5 | OVLFL | B'0 | R/W* | <p>Overload Flag</p> <p>This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.</p> <p>0: No overload is detected.</p> <p>1: Overload is detected.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|------|---|
| 4 | BORF | B'0 | R/W* | <p>Bus Off Recovery Flag</p> <p>This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.</p> <ul style="list-style-type: none"> The CHMDC[1:0] bits in the RSCFDnCmCTR register are set to B'01 (channel reset mode). The RTBO bit in the RSCFDnCmCTR register is set to 1 (forcible return from the bus off state is made). The BOM[1:0] bits in the RSCFDnCmCTR register are set to B'01 (transition to channel halt mode at bus off entry). The CHMDC[1:0] bits in the RSCFDnCmCTR register are set to B'10 (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to B'11 (transition to channel halt mode upon a request from the program during bus off). <p>0: No bus off recovery is detected. 1: Bus off recovery is detected.</p> |
| 3 | BOEF | B'0 | R/W* | <p>Bus Off Entry Flag</p> <p>This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCmCTR register (m = 0 or 1) set to B'01 (transition to channel halt mode at bus off entry).</p> <p>0: No bus off entry is detected. 1: Bus off entry is detected.</p> |
| 2 | EPF | B'0 | R/W* | <p>Error Passive Flag</p> <p>This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC[7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.</p> <p>0: No error passive is detected. 1: Error passive is detected.</p> |
| 1 | EWF | B'0 | R/W* | <p>Error Warning Flag</p> <p>This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC[7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.</p> <p>0: No error warning is detected. 1: Error warning is detected.</p> |
| 0 | BEF | B'0 | R/W* | <p>Bus Error Flag</p> <p>This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCmERFL register is set to 1.</p> <p>0: No channel bus error is detected. 1: Channel bus error is detected.</p> |

Note: To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCMCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCMERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

48.7.3 Details of Global Related Registers

48.7.3.1 RSCFDnGCFG - Global Configuration Register

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGCFG register can be read/written in 32-bit units

RSCFDnGCFGL, RSCFDnGCFGH registers can be read/written in 16-bit units

RSCFDnGCFGLL, RSCFDnGCFGLH, RSCFDnGCFGHL, RSCFDnGCFGHH registers can be read/written in 8-bit units

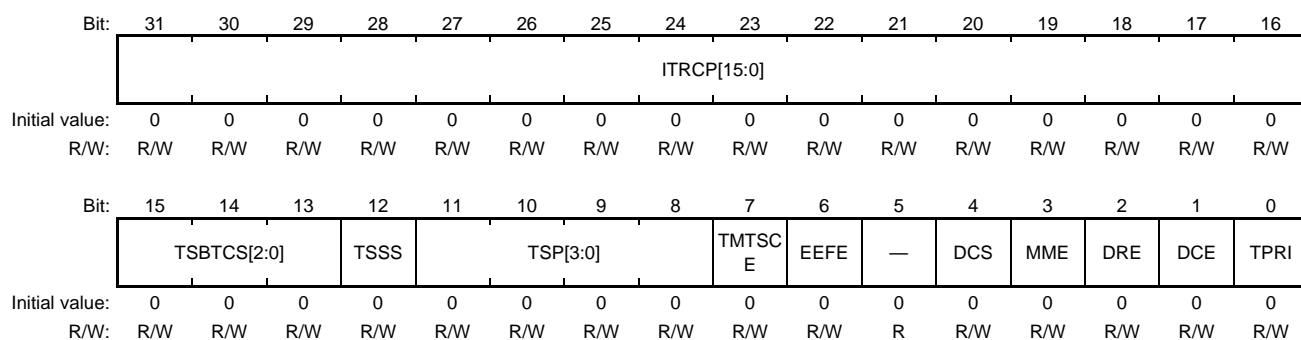

Address: RSCFDnGCFG: <RSCFDn_base> + H'0084

RSCFDnGCFGL: <RSCFDn_base> + H'0084, RSCFDnGCFGH: <RSCFDn_base> + H'0086

RSCFDnGCFGLL: <RSCFDn_base> + H'0084, RSCFDnGCFGLH: <RSCFDn_base> + H'0085,

RSCFDnGCFGHL: <RSCFDn_base> + H'0086, RSCFDnGCFGHH: <RSCFDn_base> + H'0087

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | ITRCP[15:0] | H'0000 | R/W | Interval Timer Prescaler Set These bits are used to set a clock source division value of the interval timer for FIFO buffers. See section 48.13.3.1, Interval Transmission Function. When these bits are set to M, the pclk is divided by M. Setting H'0000 is prohibited when the interval timer is in use. |
| 15 to 13 | TSBTCS[2:0] | B'000 | R/W | Timestamp Clock Source Select When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter. B'000: Channel 0 bit time clock B'001: Channel 1 bit time clock B'010: Setting prohibited B'011: Setting prohibited B'100: Setting prohibited B'101: Setting prohibited B'110: Setting prohibited B'111: Setting prohibited |
| 12 | TSSS | 0 | R/W | Timestamp Source Select This bit is used to select a clock source of the timestamp counter. 0: pclk/2*1 1: Bit time clock |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 11 to 8 | TSP[3:0] | B'0000 | R/W | <p>Timestamp Clock Source Division</p> <p>A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.</p> <p>B'0000: Not divided B'0001: Divided by 2 B'0010: Divided by 4 B'0011: Divided by 8 B'0100: Divided by 16 B'0101: Divided by 32 B'0110: Divided by 64 B'0111: Divided by 128 B'1000: Divided by 256 B'1001: Divided by 512 B'1010: Divided by 1024 B'1011: Divided by 2048 B'1100: Divided by 4096 B'1101: Divided by 8192 B'1110: Divided by 16384 B'1111: Divided by 32768</p> |
| 7 | TMTSCE | B'0 | R/W | <p>Transmit Timestamp Enable</p> <p>Setting this bit to 1 can store the timestamp of the transmission-completed message into the transmit history buffer. The timestamp is stored in the TMTS[15:0] bits in the RSCFDnTHLACCm register.</p> <p>0: Transmit timestamp is disabled. 1: Transmit timestamp is enabled.</p> |
| 6 | EEFE | B'0 | R/W | <p>ECC Error Flag Enable</p> <p>Setting this bit to 1 sets the EEfm bit in the RSCFDnGERFL register to 1 if an ECC2 bit error is detected as a result of a transmit priority selection. Here, the message in which the ECC2 bit error is detected is not transmitted.</p> <p>0: ECC error flag is disabled. 1: ECC error flag is enabled.</p> |
| 5 | Reserved | B'0 | R | <p>When read, the value after reset is returned.</p> <p>When writing to this bit, write the value after reset.</p> |
| 4 | DCS | B'0 | R/W | <p>CAN Clock Source Select*2</p> <p>When this bit is set to 0, clk is used as the clock source of the CAN clock (fCAN).</p> <p>When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).</p> <p>For the CAN clock frequency settings, see section 48.16.1.3, Setting Communication Speed.</p> <p>0: clk 1: clk_xincan</p> |
| 3 | MME | B'0 | R/W | <p>Mirror Function Enable</p> <p>Setting this bit to 1 makes the mirror function available.</p> <p>0: Mirror function is disabled. 1: Mirror function is enabled.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 2 | DRE | B'0 | R/W | <p>DLC Replacement Enable</p> <p>When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of H'00 is stored in each data byte beyond the DLC value of the receive rule.</p> <p>The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).</p> <p>0: DLC replacement is disabled. 1: DLC replacement is enabled.</p> |
| 1 | DCE | B'0 | R/W | <p>DLC Check Enable</p> <p>Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnGAFLPO_j register to B'0000 before clearing the DCE bit in the RSCFDnGCFG register to 0.</p> <p>0: DLC check is disabled. 1: DLC check is enabled.</p> |
| 0 | TPRI | B'0 | R/W | <p>Transmit Priority Select</p> <p>This bit is used to set the transmit priority.</p> <p>When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.</p> <p>While the transmit queue is in use, this bit should be set to 0.</p> <p>0: ID priority 1: Transmit buffer number priority</p> |

- Notes:
1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to B'000.
 2. For the CAN clock frequency settings, see section 48.16.1.3, Setting Communication Speed.

Modify the RSCFDnGCFG register only in global reset mode.

48.7.3.2 RSCFDnGCTR — Global Control Register

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | AFLDA E | — | — | — | AFLPN[4:0] | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 9 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | B'0 | R/W | Receive Rule Table Write Enable Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit. Set the AFLDAE bit to 1 only in global reset mode. 0: Receive rule table write is disabled. 1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | B'0_0000 | R/W | Receive Rule Table Page Number Configuration These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. A page number can be selected from a range of page 0 (B'0_0000) to page 23 (B'1_0111). Set these bits to a value within the range of B'0_0000 to B'1_0111. |

48.7.4.2 RSCFDnGAFLCFG0 — Receive Rule Configuration Register 0

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGAFLCFG0 register can be read/written in 32-bit units

RSCFDnGAFLCFG0L, RSCFDnGAFLCFG0H registers can be read/written in 16-bit units

RSCFDnGAFLCFG0LL, RSCFDnGAFLCFG0LH, RSCFDnGAFLCFG0HL, RSCFDnGAFLCFG0HH registers can be read/written in 8-bit units

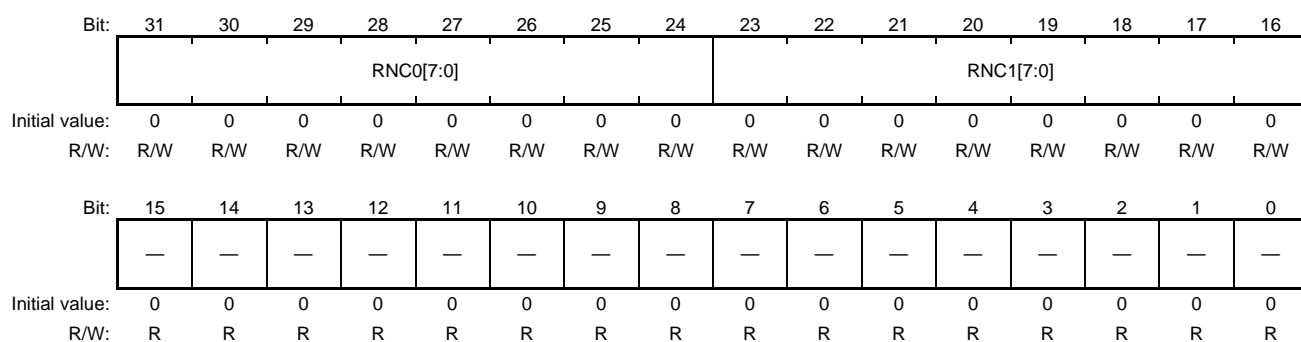

Address: RSCFDnGAFLCFG0: <RSCFDn_base> + H'009C

RSCFDnGAFLCFG0L: <RSCFDn_base> + H'009C, RSCFDnGAFLCFG0H: <RSCFDn_base> + H'009E

RSCFDnGAFLCFG0LL: <RSCFDn_base> + H'009C, RSCFDnGAFLCFG0LH: <RSCFDn_base> + H'009D,

RSCFDnGAFLCFG0HL: <RSCFDn_base> + H'009E, RSCFDnGAFLCFG0HH: <RSCFDn_base> + H'009F

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 24 | RNC0[7:0] | H'00 | R/W | Number of Rules for Channel 0 These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80. |
| 23 to 16 | RNC1[7:0] | H'00 | R/W | Number of Rules for Channel 1 These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80. |
| 15 to 0 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnGAFLCFG0 register only in global reset mode.

Up to $64 \times$ (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

The maximum number of rules per channel is 128.

The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

48.7.4.3 RSCFDnGAFLCFG1 — Receive Rule Configuration Register 1

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGAFLCFG1 register can be read/written in 32-bit units

RSCFDnGAFLCFG1L, RSCFDnGAFLCFG1H registers can be read/written in 16-bit units

RSCFDnGAFLCFG1LL, RSCFDnGAFLCFG1LH, RSCFDnGAFLCFG1HL, RSCFDnGAFLCFG1HH registers can be read/written in 8-bit units

Address: RSCFDnGAFLCFG1: <RSCFDn_base> + H'00A0

RSCFDnGAFLCFG1L: <RSCFDn_base> + H'00A0, RSCFDnGAFLCFG1H: <RSCFDn_base> + H'00A2

RSCFDnGAFLCFG1LL: <RSCFDn_base> + H'00A0, RSCFDnGAFLCFG1LH: <RSCFDn_base> + H'00A1,

RSCFDnGAFLCFG1HL: <RSCFDn_base> + H'00A2, RSCFDnGAFLCFG1HH: <RSCFDn_base> + H'00A3

Value after reset: H'0000_0000

| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnGAFLCFG1 register only in global reset mode.

48.7.4.4 RSCFDnGAFLIDj — Receive Rule ID Register (j = 0 to 15)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGAFLIDj register can be read/written in 32-bit units

RSCFDnGAFLIDjL, RSCFDnGAFLIDjH registers can be read/written in 16-bit units

RSCFDnGAFLIDjLL, RSCFDnGAFLIDjLH, RSCFDnGAFLIDjHL, RSCFDnGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnGAFLIDj: <RSCFDn_base> + H'0500 + (H'10 × j)

RSCFDnGAFLIDjL: <RSCFDn_base> + H'0500 + (H'10 × j),

RSCFDnGAFLIDjH: <RSCFDn_base> + H'0502 + (H'10 × j)

RSCFDnGAFLIDjLL: <RSCFDn_base> + H'0500 + (H'10 × j),

RSCFDnGAFLIDjLH: <RSCFDn_base> + H'0501 + (H'10 × j),

RSCFDnGAFLIDjHL: <RSCFDn_base> + H'0502 + (H'10 × j),

RSCFDnGAFLIDjHH: <RSCFDn_base> + H'0503 + (H'10 × j)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 31 | GAFLIDE | B'0 | R/W | <p>IDE Select</p> <p>This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.</p> <p>0: Standard ID 1: Extended ID</p> |
| 30 | GAFLRTR | B'0 | R/W | <p>RTR Select</p> <p>This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.</p> <p>0: Data frame 1: Remote frame</p> |
| 29 | GAFLLB | B'0 | R/W | <p>Receive Rule Target Message Select</p> <p>When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.</p> <p>When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.</p> <p>0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|--|
| 28 to 0 | GAFLID[28:0] | H'0000_0000 | R/W | <p>ID Set</p> <p>These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.</p> <p>For the standard ID, set the ID in bits 10 to 0 and set bits 28 to 11 to 0.</p> |

Modify the RSCFDnGAFLIDj register when the AFLDAE bit in the RSCFDnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

48.7.4.5 RSCFDnGAFLMj — Receive Rule Mask Register (j = 0 to 15)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGAFLMj register can be read/written in 32-bit units

RSCFDnGAFLMjL, RSCFDnGAFLMjH registers can be read/written in 16-bit units

RSCFDnGAFLMjLL, RSCFDnGAFLMjLH, RSCFDnGAFLMjHL, RSCFDnGAFLMjHH registers can be read/written in 8-bit units

Address: RSCFDnGAFLMj: <RSCFDn_base> + H'0504 + (H'10 × j)
 RSCFDnGAFLMjL: <RSCFDn_base> + H'0504 + (H'10 × j),
 RSCFDnGAFLMjH: <RSCFDn_base> + H'0506 + (H'10 × j)
 RSCFDnGAFLMjLL: <RSCFDn_base> + H'0504 + (H'10 × j),
 RSCFDnGAFLMjLH: <RSCFDn_base> + H'0505 + (H'10 × j),
 RSCFDnGAFLMjHL: <RSCFDn_base> + H'0506 + (H'10 × j),
 RSCFDnGAFLMjHH: <RSCFDn_base> + H'0507 + (H'10 × j)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------------|---------------|-----|--|
| 31 | GAFLIDEM | B'0 | R/W | <p>IDE Mask</p> <p>When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnGAFLIDj register.</p> <p>When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set the GAFLIDM[28:0] bits to all 0 at the same time.</p> <p>0: The IDE bit is not compared. 1: The IDE bit is compared.</p> |

 RSCFDnGAFLP1_jHH: <RSCFDn_base> + H'050F + (H'10 × j)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------------|---------------|-----|---|
| 31 to 26 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 25 to 8 | GAFLFDP [25:8] | H'0_0000 | R/W | Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected. |
| 7 to 0 | GAFLFDP [7:0] | H'00 | R/W | Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected. |

Modify the RSCFDnGAFLP1_j register when the AFLDAE bit in the RSCFDnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFCC register are set to B'00 (receive mode) or B'10 (gateway mode) are selectable.

| 7 to 0 | NRXMB[7:0] | H'00 | R/W | Receive Buffer Number Configuration These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels). Setting these bits all to 0 makes receive buffers unavailable. Set a value of 0 to 96. |

Modify the RSCFDnRMNB register only in global reset mode.

48.7.5.2 RSCFDnRMNDy — Receive Buffer New Data Register (y = 0)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRMNDy register can be read/written in 32-bit units

RSCFDnRMNDyL, RSCFDnRMNDyH registers can be read/written in 16-bit units

RSCFDnRMNDyLL, RSCFDnRMNDyLH, RSCFDnRMNDyHL, RSCFDnRMNDyHH registers can be read/written in 8-bit units

Address: RSCFDnRMNDy: <RSCFDn_base> + H'00A8 + (H'04 × y)

RSCFDnRMNDyL: <RSCFDn_base> + H'00A8 + (H'04 × y),

RSCFDnRMNDyH: <RSCFDn_base> + H'00AA + (H'04 × y)

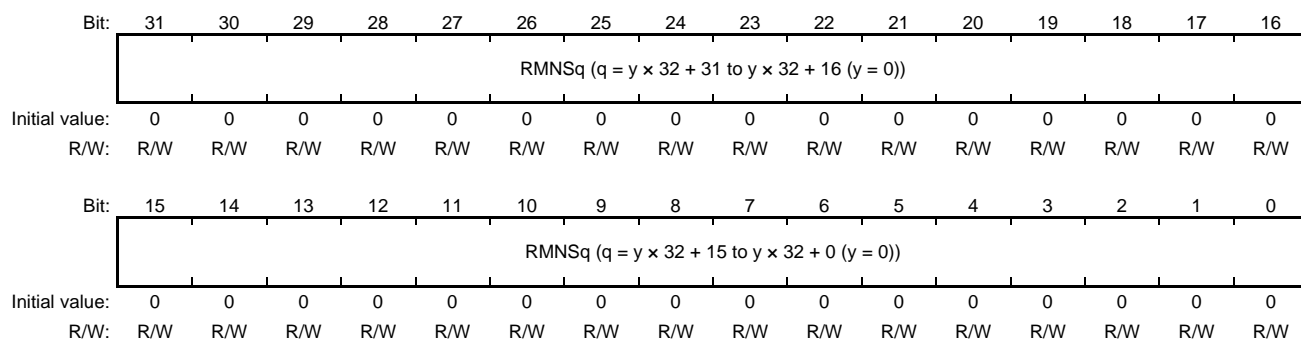

RSCFDnRMNDyLL: <RSCFDn_base> + H'00A8 + (H'04 × y),

RSCFDnRMNDyLH: <RSCFDn_base> + H'00A9 + (H'04 × y),

RSCFDnRMNDyHL: <RSCFDn_base> + H'00AA + (H'04 × y),

RSCFDnRMNDyHH: <RSCFDn_base> + H'00AB + (H'04 × y)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | RMNSq | H'0000_0000 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. |

Write 0 to the RSCFDnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNS flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten clock cycles of pclk to store a message.

These flags are cleared to 0 in global reset mode.

48.7.5.3 RSCFDnRMIDq — Receive Buffer ID Register (q = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |

| 27 to 16 | RMPTR[11:0] | H'000 | R | Receive Buffer Label Data These bits indicate the label information of the message stored in the receive buffer. |
| 15 to 0 | RMTS[15:0] | H'0000 | R | Receive Buffer Timestamp Data These bits indicate the timestamp value of the message stored in the receive buffer. |

48.7.5.5 RSCFDnRMDF0_q — Receive Buffer Data Field 0 Register (q = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRMDF0_q register can be read only in 32-bit units

RSCFDnRMDF0_qL, RSCFDnRMDF0_qH registers can be read only in 16-bit units

RSCFDnRMDF0_qLL, RSCFDnRMDF0_qLH, RSCFDnRMDF0_qHL, RSCFDnRMDF0_qHH registers can be read only in 8-bit units

Address: RSCFDnRMDF0_q: <RSCFDn_base> + H'0608 + (H'10 × q)

RSCFDnRMDF0_qL: <RSCFDn_base> + H'0608 + (H'10 × q),

RSCFDnRMDF0_qH: <RSCFDn_base> + H'060A + (H'10 × q)

RSCFDnRMDF0_qLL: <RSCFDn_base> + H'0608 + (H'10 × q),

RSCFDnRMDF0_qLH: <RSCFDn_base> + H'0609 + (H'10 × q),

RSCFDnRMDF0_qHL: <RSCFDn_base> + H'060A + (H'10 × q),

RSCFDnRMDF0_qHH: <RSCFDn_base> + H'060B + (H'10 × q)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|----------------------------|
| 31 to 24 | RMDB3[7:0] | H'00 | R | Receive Buffer Data Byte 3 |
| 23 to 16 | RMDB2[7:0] | H'00 | R | Receive Buffer Data Byte 2 |
| 15 to 8 | RMDB1[7:0] | H'00 | R | Receive Buffer Data Byte 1 |
| 7 to 0 | RMDB0[7:0] | H'00 | R | Receive Buffer Data Byte 0 |

Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCFDnRMPTRq register is smaller than B'1000, data bytes for which no data is set are read as H'00.

48.7.5.6 RSCFDnRMDF1_q — Receive Buffer Data Field 1 Register (q = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRMDF1_q register can be read only in 32-bit units

RSCFDnRMDF1_qL, RSCFDnRMDF1_qH register can be read only in 16-bit units

RSCFDnRMDF1_qLL, RSCFDnRMDF1_qLH, RSCFDnRMDF1_qHL, RSCFDnRMDF1_qHH registers can be read only in 8-bit units

Address: RSCFDnRMDF1_q: <RSCFDn_base> + H'060C + (H'10 × q)

RSCFDnRMDF1_qL: <RSCFDn_base> + H'060C + (H'10 × q),

RSCFDnRMDF1_qH: <RSCFDn_base> + H'060E + (H'10 × q)

RSCFDnRMDF1_qLL: <RSCFDn_base> + H'060C + (H'10 × q),

RSCFDnRMDF1_qLH: <RSCFDn_base> + H'060D + (H'10 × q),

RSCFDnRMDF1_qHL: <RSCFDn_base> + H'060E + (H'10 × q),

RSCFDnRMDF1_qHH: <RSCFDn_base> + H'060F + (H'10 × q)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|----------------------------|
| 31 to 24 | RMDB7[7:0] | H'00 | R | Receive Buffer Data Byte 7 |
| 23 to 16 | RMDB6[7:0] | H'00 | R | Receive Buffer Data Byte 6 |
| 15 to 8 | RMDB5[7:0] | H'00 | R | Receive Buffer Data Byte 5 |
| 7 to 0 | RMDB4[7:0] | H'00 | R | Receive Buffer Data Byte 4 |

Data for a message stored in the receive buffer can be read.

When the RMDLC[3:0] value in the RSCFDnRMPTRq register is smaller than B'1000, data bytes for which no data is set are read as H'00.

48.7.6 Details of Receive FIFO Buffer Related Registers

48.7.6.1 RSCFDnRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 15 to 13 | RFIGCV[2:0] | B'000 | R/W | Receive FIFO Interrupt Request Timing Select These bits are used to specify the number of received messages for generating a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]). When the RFDC[2:0] bits are set to B'001 (4 messages), set the RFIGCV[2:0] bits to B'001, B'011, B'101, or B'111. Modify these bits only in global reset mode. B'000: When FIFO is 1/8 full. B'001: When FIFO is 2/8 full. B'010: When FIFO is 3/8 full. B'011: When FIFO is 4/8 full. B'100: When FIFO is 5/8 full. B'101: When FIFO is 6/8 full. B'110: When FIFO is 7/8 full. B'111: When FIFO is full. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 12 | RFIM | B'0 | R/W | <p>Receive FIFO Interrupt Source Select</p> <p>This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.</p> <p>0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met.</p> <p>1: An interrupt occurs each time a message has been received.</p> |
| 11 | Reserved | B'0 | R | <p>This bit is read as the value after reset.</p> <p>The write value should be the value after reset.</p> |
| 10 to 8 | RFDC[2:0] | B'000 | R/W | <p>Receive FIFO Buffer Depth Configuration</p> <p>These bits are used to select the number of messages that can be stored in a single receive FIFO buffer.</p> <p>When these bits are set to B'000, no receive FIFO buffer should be used. Modify these bits only in global reset mode.</p> <p>B'000: 0 messages B'001: 4 messages B'010: 8 messages B'011: 16 messages B'100: 32 messages B'101: 48 messages B'110: 64 messages B'111: 128 messages</p> |
| 7 to 2 | Reserved | All 0 | R | <p>These bits are read as the value after reset.</p> <p>The write value should be the value after reset.</p> |
| 1 | RFIE | B'0 | R/W | <p>Receive FIFO Interrupt Enable</p> <p>Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit set to 0 (no receive FIFO buffer is used).</p> <p>0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.</p> |
| 0 | RFE | B'0 | R/W | <p>Receive FIFO Buffer Enable</p> <p>Setting the RFE bit to 1 makes receive FIFO buffers available. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnRFSTx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.</p> <p>0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.</p> |

48.7.6.2 RSCFDnRFSTsX — Receive FIFO Buffer Status Register (x = 0 to 7)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRFSTsX register can be read/written in 32-bit units

RSCFDnRFSTsXL, RSCFDnRFSTsXH registers can be read/written in 16-bit units

RSCFDnRFSTsxLL, RSCFDnRFSTsxLH, RSCFDnRFSTsxHL, RSCFDnRFSTsxHH registers can be read/written in 8-bit units

Address: RSCFDnRFSTsX: <RSCFDn_base> + H'00D8 + (H'04 × x)

RSCFDnRFSTsXL: <RSCFDn_base> + H'00D8 + (H'04 × x),

RSCFDnRFSTsXH: <RSCFDn_base> + H'00DA + (H'04 × x)

RSCFDnRFSTsxLL: <RSCFDn_base> + H'00D8 + (H'04 × x),

RSCFDnRFSTsxLH: <RSCFDn_base> + H'00D9 + (H'04 × x),

RSCFDnRFSTsxHL: <RSCFDn_base> + H'00DA + (H'04 × x),

RSCFDnRFSTsxHH: <RSCFDn_base> + H'00DB + (H'04 × x)

Value after reset: H'0000_0001

| | | | | | | | | | | | | | | | | |

| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | RFMC[7:0] | | | | | | | — | — | — | — | RFIF | RFMLT | RFLL | RFEMP | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W* | R/W* | R | R |

Note: * The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|------|---|
| 31 to 16 | Reserved | All 0 | R | These bits are read as the value after reset. When writing to these bits, write the value after reset. |
| 15 to 8 | RFMC[7:0] | H'00 | R | Receive FIFO Unread Message Counter This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCFDnRFCCx register is set to 0. |
| 7 to 4 | Reserved | All 0 | R | These bits are read as the value after reset. When writing to these bits, write the value after reset. |
| 3 | RFIF | B'0 | R/W* | Receive FIFO Interrupt Request Flag This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode. To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1". 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|------|--|
| 2 | RFMLT | B'0 | R/W* | <p>Receive FIFO Message Lost Flag</p> <p>This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.</p> <p>This flag is cleared to 0 in global reset mode or by writing 0 to this flag.</p> <p>Modify this bit in global operating mode or global test mode.</p> <p>To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.</p> <p>When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".</p> <p>0: No receive FIFO message is lost. 1: A receive FIFO message is lost.</p> |
| 1 | RFFLL | B'0 | R | <p>Receive FIFO Buffer Full Status Flag</p> <p>This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnRFCCx register.</p> <p>If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.</p> <p>0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.</p> |
| 0 | RFEMP | B'1 | R | <p>Receive FIFO Buffer Empty Status Flag</p> <p>This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnRFCCx register is 0 or in global reset mode.</p> <p>This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.</p> <p>0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).</p> |

Note: To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

48.7.6.3 RSCFDnRFPCTR_x — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 28 | RFDLC[3:0] | B'0000 | R | Receive FIFO Buffer DLC Data These bits contain the data length of the message stored in the receive FIFO buffer. B'0000: 0 data bytes B'0001: 1 data byte B'0010: 2 data bytes B'0011: 3 data bytes B'0100: 4 data bytes B'0101: 5 data bytes B'0110: 6 data bytes B'0111: 7 data bytes B'1XXX: 8 data bytes |
| 27 to 16 | RFPTR[11:0] | H'000 | R | Receive FIFO Buffer Label Data These bits contain the label information of the message stored in the receive FIFO buffer. |
| 15 to 0 | RFTS[15:0] | H'0000 | R | Receive FIFO Buffer Timestamp Data These bits contain the timestamp value of the message stored in the receive FIFO buffer. |

48.7.6.6 RSCFDnRFDF0_x — Receive FIFO Buffer Access Data Field 0 Register (x = 0 to 7)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRFDF0_x register can be read only in 32-bit units

RSCFDnRFDF0_xL, RSCFDnRFDF0_xH registers can be read only in 16-bit units

RSCFDnRFDF0_xLL, RSCFDnRFDF0_xLH, RSCFDnRFDF0_xHL, RSCFDnRFDF0_xHH registers can be read only in 8-bit units

Address: RSCFDnRFDF0_x: <RSCFDn_base> + H'0E08 + (H'10 × x)

RSCFDnRFDF0_xL: <RSCFDn_base> + H'0E08 + (H'10 × x),

RSCFDnRFDF0_xH: <RSCFDn_base> + H'0E0A + (H'10 × x)

RSCFDnRFDF0_xLL: <RSCFDn_base> + H'0E08 + (H'10 × x),

RSCFDnRFDF0_xLH: <RSCFDn_base> + H'0E09 + (H'10 × x),

RSCFDnRFDF0_xHL: <RSCFDn_base> + H'0E0A + (H'10 × x),

RSCFDnRFDF0_xHH: <RSCFDn_base> + H'0E0B + (H'10 × x)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---------------------------------|
| 31 to 24 | RFDB3[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 3 |
| 23 to 16 | RFDB2[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 2 |
| 15 to 8 | RFDB1[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 1 |
| 7 to 0 | RFDB0[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 0 |

Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] value in the RSCFDnRFPTRx register is smaller than B'1000, data bytes for which no data is set are read as H'00.

48.7.6.7 RSCFDnRFDF1_x — Receive FIFO Buffer Access Data Field 1 Register (x = 0 to 7)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRFDF1_x register can be read only in 32-bit units

RSCFDnRFDF1_xL, RSCFDnRFDF1_xH registers can be read only in 16-bit units

RSCFDnRFDF1_xLL, RSCFDnRFDF1_xLH, RSCFDnRFDF1_xHL, RSCFDnRFDF1_xHH registers can be read only in 8-bit units

Address: RSCFDnRFDF1_x: <RSCFDn_base> + H'0E0C + (H'10 × x)

RSCFDnRFDF1_xL: <RSCFDn_base> + H'0E0C + (H'10 × x),

RSCFDnRFDF1_xH: <RSCFDn_base> + H'0E0E + (H'10 × x)

RSCFDnRFDF1_xLL: <RSCFDn_base> + H'0E0C + (H'10 × x),

RSCFDnRFDF1_xLH: <RSCFDn_base> + H'0E0D + (H'10 × x),

RSCFDnRFDF1_xHL: <RSCFDn_base> + H'0E0E + (H'10 × x),

RSCFDnRFDF1_xHH: <RSCFDn_base> + H'0E0F + (H'10 × x)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---------------------------------|
| 31 to 24 | RFDB7[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 7 |
| 23 to 16 | RFDB6[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 6 |
| 15 to 8 | RFDB5[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 5 |
| 7 to 0 | RFDB4[7:0] | H'00 | R | Receive FIFO Buffer Data Byte 4 |

Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] value in the RSCFDnRFPTRx register is smaller than B'1000, data bytes for which no data is set are read as H'00.

48.7.7 Details of Transmit/Receive FIFO Buffer Related Registers

48.7.7.1 RSCFDnCFCCk — Transmit/receive FIFO Buffer Configuration and Control Register k (k = 0 to 5)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 28 | CFDLC[3:0] | B'0000 | R/W | Transmit/Receive FIFO Buffer DLC Data These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is B'00. When the CFM[1:0] value is B'01, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 9 bytes or more, the actual transmit data defaults to 8 bytes. B'0000: 0 data bytes B'0001: 1 data byte B'0010: 2 data bytes B'0011: 3 data bytes B'0100: 4 data bytes B'0101: 5 data bytes B'0110: 6 data bytes B'0111: 7 data bytes B'1XXX: 8 data bytes |
| 27 to 16 | CFPTR[11:0] | H'000 | R/W | Transmit/Receive FIFO Buffer Label Data <ul style="list-style-type: none"> • When CFM[1:0] value is B'01 (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is B'00 (receive mode): The label information of the received message can be read. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 15 to 0 | CFTS[15:0] | H'0000 | R/W | Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is B'00 (receive mode). The timestamp value of the received message can be read. |

This register is writable only when the CFM[1:0] value in the RSCFDnCFCCk register is B'01 (transmit mode). This register is readable only when the CFM[1:0] value is B'00 (receive mode). This register should not be read or written when the CFM[1:0] value is B'10 (gateway mode).

| 2 | CF2TXIF | B'0 | R | |
| 1 | CF1TXIF | B'0 | R | |
| 0 | CF0TXIF | B'0 | R | |

The RSCFDnCFTISTS register is cleared to H'0000_0000 in global reset mode.

48.7.9 Details of Transmit Buffer Related Registers

48.7.9.1 RSCFDnTMCp — Transmit Buffer Control Register (p = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnTMCp register can be read/written in 8-bit units

Address: RSCFDnTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

Value after reset: H'00

| | | | | | | | | |
|------|---|---|---|---|---|------|-------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TMOM | TMTAR | TMTR |

Initial value: 0 0 0 0 0 0 0 0 0

R/W: R R R R R R/W* R/W* R/W*

Note: * The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|------|---|
| 7 to 3 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMOM | B'0 | R/W* | One-Shot Transmission Enable Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed. Modify the TMOM bit when the TMTRM flag in the RSCFDnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit. 0: One-shot transmission is disabled. 1: One-shot transmission is enabled. |
| 1 | TMTAR | B'0 | R/W* | Transmit Abort Request Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted. The TMTAR bit can be set to 1 when TMTR bit is 1. The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit. Transmission has been completed. Transmit abort has been completed. An error or arbitration loss has been detected. If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0. 0: Transmit abort is not requested. 1: Transmit abort is requested. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|------|--|
| 0 | TMTR | B'0 | R/W* | <p>Transmit Request</p> <p>Setting this bit to 1 transmits the message stored in the transmit buffer.</p> <p>The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.</p> <ul style="list-style-type: none"> Transmission has been completed. Transmit abort has been completed after the TMTAR bit was set to 1. An error or arbitration-lost has been detected with the TMOM bit set to 1. <p>Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnTMSTSp register is B'00.</p> <p>0: Transmission is not requested. 1: Transmission is requested.</p> |

When the RSCFDnTMCp register meets any of the following conditions, set it to H'00.

The RSCFDnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFCCk register ($p = m \times 16 + \text{the value of CFTML}[3:0] \text{ bits}$).

The RSCFDnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnTXQCCm ($m = 0 \text{ or } 1$) register ($p = (m \times 16 + 15) \text{ to } (m \times 16 + 15 - \text{the value of TXQDC}[3:0] \text{ bits})$).

Bits in the RSCFDnTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnTMCp register in channel communication mode or channel halt mode.

48.7.9.2 RSCFDnTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnTMSTSp register can be read/written in 8-bit units

Address: RSCFDnTMSTSp: <RSCFDn_base> + H'02D0 + (H'01 × p)

Value after reset: H'00

| | | | | | | | | |
|----------------|---|---|---|------------|-----------|------------|------------|---|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | TMTAR M | TMTR M | TMTRF[1:0] | TMTST S | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R/W | R/W | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|------------|---------------|-----|---|
| 7 to 5 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 | TMTARM | B'0 | R | Transmit Buffer Transmit Abort Request Status Flag The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnTMCP register is set to 1. The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnTMCP register is set to 0. 0: No transmit abort request is present. 1: A transmit abort request is present. |
| 3 | TMTRM | B'0 | R | Transmit Buffer Transmit Request Status Flag The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnTMCP register is set to 1. The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnTMCP register is set to 0. 0: No transmit request is present. 1: A transmit request is present. |
| 2, 1 | TMTRF[1:0] | B'00 | R/W | Transmit Buffer Transmit Result Status Flag This flag indicates the result of transmission from the transmit buffer. B'00: Transmission is in progress or no transmit request is present. B'01: Transmission from the transmit buffer was aborted. B'10: Transmission has been completed with the TMTAR bit in the RSCFDnTMCP register set to 0 (transmit abort is not requested). B'11: Transmission has been completed with the TMTAR bit in the RSCFDnTMCP register set to 1 (transmit abort is requested). Write B'00 to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than B'00 to this flag. |
| 0 | TMTSTS | B'0 | R | Transmit Buffer Transmit Status Flag This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost. 0: Transmission is not in progress. 1: Transmission is in progress. |

The RSCFDnTMSTSp register is cleared to all 0 in channel reset mode.

48.7.9.3 RSCFDnTMIDp — Transmit Buffer ID Register (p = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnTMIDp register can be read/written in 32-bit units

RSCFDnTMIDpL, RSCFDnTMIDpH registers can be read/written in 16-bit units

RSCFDnTMIDpLL, RSCFDnTMIDpLH, RSCFDnTMIDpHL, RSCFDnTMIDpHH registers can be read/written in 8-bit units

Address: RSCFDnTMIDp: <RSCFDn_base> + H'1000 + (H'10 × p)

RSCFDnTMIDpL: <RSCFDn_base> + H'1000 + (H'10 × p),

RSCFDnTMIDpH: <RSCFDn_base> + H'1002 + (H'10 × p)

RSCFDnTMIDpLL: <RSCFDn_base> + H'1000 + (H'10 × p),

RSCFDnTMIDpLH: <RSCFDn_base> + H'1001 + (H'10 × p),

RSCFDnTMIDpHL: <RSCFDn_base> + H'1002 + (H'10 × p),

RSCFDnTMIDpHH: <RSCFDn_base> + H'1003 + (H'10 × p)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 31 | TMIDE | B'0 | R/W | Transmit Buffer IDE This bit is used to set the ID format of the message to be transmitted from the transmit buffer. 0: Standard ID 1: Extended ID |
| 30 | TMRTR | B'0 | R/W | Transmit Buffer RTR This bit is used to set the data format of the message to be transmitted from the transmit buffer. 0: Data frame 1: Remote frame |
| 29 | THLEN | B'0 | R/W | Transmit History Data Store Enable With this bit set to 1, the transmit history data of the message transmitted (label information, buffer number, and buffer type; if the TMTSCE bit in the RSCFDnGCFG register is 1, timestamp is also included) is stored in the transmit history buffer after transmission is completed. 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 28 to 0 | TMID[28:0] | H'0000_0000 | R/W | Transmit Buffer ID Data These bits are used to set the ID of the message to be transmitted from the transmit buffer. Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. |

Modify this register when the TMTRM bit in the corresponding RSCFDnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p ($p = m \times 16 + 15$) for the corresponding channel.

48.7.9.4 RSCFDnTMPTRp — Transmit Buffer Pointer Register (p = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnTMPTRp register can be read/written in 32-bit units

RSCFDnTMPTRpL, RSCFDnTMPTRpH registers can be read/written in 16-bit units

RSCFDnTMPTRpLL, RSCFDnTMPTRpLH, RSCFDnTMPTRpHL, RSCFDnTMPTRpHH registers can be read/written in 8-bit units

Address: RSCFDnTMPTRp: <RSCFDn_base> + H'1004 + (H'10 × p)

RSCFDnTMPTRpL: <RSCFDn_base> + H'1004 + (H'10 × p),

RSCFDnTMPTRpH: <RSCFDn_base> + H'1006 + (H'10 × p)

RSCFDnTMPTRpLL: <RSCFDn_base> + H'1004 + (H'10 × p),

RSCFDnTMPTRpLH: <RSCFDn_base> + H'1005 + (H'10 × p),

RSCFDnTMPTRpHL: <RSCFDn_base> + H'1006 + (H'10 × p),

RSCFDnTMPTRpHH: <RSCFDn_base> + H'1007 + (H'10 × p)

Value after reset: H'0000_0000

| | | | | | | | | | | | | | | | | |
|----------------|------------|-----|-----|-----|----|----|----|----|------------|-----|-----|-----|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 7 to 0 | TMDB0[7:0] | H'00 | R/W | Transmit Buffer Data Byte 0 |

Set the transmit buffer data.

Modify this register when the TMTRM bit in the corresponding RSCFDnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p ($p = m \times 16 + 15$) for the corresponding channel.

RSCFDnTMIECyHL: <RSCFDn_base> + H'0392 + (H'04 × y),

RSCFDnTMIECyHH: <RSCFDn_base> + H'0393 + (H'04 × y)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | TMIEp | H'0000_0000 | R/W | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 0) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled |

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 48.11 shows the bit assignment.

Modify this bit in channel reset mode. 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted. |
| 12 | TXQIE | 0 | R/W | Transmit Queue Interrupt Enable When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated. Set the TXQE bit to 0 before modifying the TXQIE bit. 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|---|
| 11 to 8 | TXQDC[3:0] | B'0000 | R/W | <p>Transmit Queue Depth Configuration</p> <p>These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from $(m \times 16 + 15)$ to $(m \times 16 + 0)$. For examples of how buffer allocation is done, see Figure 48.9. Modify these bits only in channel reset mode.</p> <p>Setting these bits to g ($g = 2$ to 15) makes the $(g + 1)$-buffer transmit queue available.</p> <p>Setting these bits to 0 disables the transmit queue.</p> <p>Setting these bits to 1 is prohibited.</p> |
| 7 to 1 | Reserved | All 0 | R | <p>When read, the value after reset is returned.</p> <p>When writing to these bits, write the value after reset.</p> |
| 0 | TXQE | B'0 | R/W | <p>Transmit Queue Enable</p> <p>Setting this bit to 1 makes the transmit queue available. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.</p> <p>Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to B'0010 or more.</p> <p>0: The transmit queue is not used.</p> <p>1: The transmit queue is used.</p> |

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W* | R/W* | R | R |

Note: * The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|------|--|
| 31 to 13 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | THLMC[4:0] | B'0_0000 | R | Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | THLIF | B'0 | R/W* | Transmit History Interrupt Request Flag The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnTHLCCm register occurs. This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag. To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1". 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|------|--|
| 2 | THLELT | B'0 | R/W* | <p>Transmit History Buffer Overflow Flag</p> <p>The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.</p> <p>To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.</p> <p>When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".</p> <p>0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.</p> |
| 1 | THLFLL | B'0 | R | <p>Transmit History Buffer Full Status Flag</p> <p>The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnTHLCCm register is set to 0 (transmit history buffer is not used).</p> <p>0: Transmit history buffer is not full. 1: Transmit history buffer is full.</p> |
| 0 | THLEMP | B'1 | R | <p>Transmit History Buffer Empty Status Flag</p> <p>The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer. This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnTHLCCm register is set to 0 (transmit history buffer is not used).</p> <p>0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).</p> |

Note: To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write "0" to the given flag and "1" to other flags.

Address: RSCFDnTHLACCm: <RSCFDn_base> + H'1800 + (H'04 × m)

RSCFDnTHLACCmL: <RSCFDn_base> + H'1800 + (H'04 × m),

RSCFDnTHLACCmH: <RSCFDn_base> + H'1802 + (H'04 × m)

RSCFDnTHLACCmLL: <RSCFDn_base> + H'1800 + (H'04 × m),

RSCFDnTHLACCmLH: <RSCFDn_base> + H'1801 + (H'04 × m),

RSCFDnTHLACCmHL: <RSCFDn_base> + H'1802 + (H'04 × m),

RSCFDnTHLACCmHH: <RSCFDn_base> + H'1803 + (H'04 × m)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 16 | TMTS[15:0] | H'0000 | R | Timestamp Data These bits indicate the timestamp value of the transmit history data stored in the transmit history buffer when the TMTSCE bit in the RSCFDnGCFG register is 1. These bits are always read as 0 when the TMTSCE bit is 0. |
| 15 to 8 | TID[7:0] | H'00 | R | Label Data These bits indicate the label information of transmit history data stored in the transmit history buffer. |
| 7 | Reserved | B'0 | R | When read, the value after reset is returned. |
| 6 to 3 | BN[3:0] | B'0000 | R | Buffer Number Data These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer. |
| 2 to 0 | BT[2:0] | B'000 | R | Buffer Type Data These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer. B'001: Transmit buffer B'010: Transmit/receive FIFO buffer B'100: Transmit queue |

48.7.13 Details of Test Related Registers

48.7.13.1 RSCFDnGTSTCFG — Global Test Configuration Register

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGTSTCFG register can be read/written in 32-bit units

RSCFDnGTSTCFGL, RSCFDnGTSTCFGH registers can be read/written in 16-bit units

RSCFDnGTSTCFGLL, RSCFDnGTSTCFGLH, RSCFDnGTSTCFGHL, RSCFDnGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCFDnGTSTCFG: <RSCFDn_base> + H'0468

RSCFDnGTSTCFGL: <RSCFDn_base> + H'0468, RSCFDnGTSTCFGH: <RSCFDn_base> + H'046A

RSCFDnGTSTCFGLL: <RSCFDn_base> + H'0468, RSCFDnGTSTCFGLH: <RSCFDn_base> + H'0469,

RSCFDnGTSTCFGHL: <RSCFDn_base> + H'046A, RSCFDnGTSTCFGHH: <RSCFDn_base> + H'046B

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|--|
| 31 to 23 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 22 to 16 | RTMPS[6:0] | H'00 | R/W | RAM Test Page Configuration These bits are used to set the RAM test target page number for RAM test. Set a value in the range of H'00 to H'38, inclusive. |
| 15 to 2 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 1 | C1ICBCE | B'0 | R/W | CAN1 Inter-Channel Communication Test Enable Setting this bit to 1 enables the channel 1 inter-channel communication test. 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled. |
| 0 | C0ICBCE | B'0 | R/W | CAN0 Inter-Channel Communication Test Enable Setting this bit to 1 enables the channel 0 inter-channel communication test. 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled. |

Modify the RSCFDnGTSTCFG register only in global test mode.

48.7.13.2 RSCFDnGTSTCTR — Global Test Control Register

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGTSTCTR register can be read/written in 32-bit units

RSCFDnGTSTCTRL, RSCFDnGTSTCTRH registers can be read/written in 16-bit units

RSCFDnGTSTCTRLL, RSCFDnGTSTCTRLH, RSCFDnGTSTCTRHL, RSCFDnGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCFDnGTSTCTR: <RSCFDn_base> + H'046C

RSCFDnGTSTCTRL: <RSCFDn_base> + H'046C, RSCFDnGTSTCTRH: <RSCFDn_base> + H'046E

RSCFDnGTSTCTRLL: <RSCFDn_base> + H'046C, RSCFDnGTSTCTRLH: <RSCFDn_base> + H'046D,

RSCFDnGTSTCTRHL: <RSCFDn_base> + H'046E, RSCFDnGTSTCTRHH: <RSCFDn_base> + H'046F

Value after reset: H'0000_0000

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|------|----|---------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | RTME | — | ICBCTME |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 3 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 2 | RTME | B'0 | R/W | RAM Test Enable Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode. 1. Set the GMDC[1:0] bits in the RSCFDnGCTR register to B'10 (Global test mode). 2. Set the RTME bit to 1. 3. Check that the RTME bit is set to 1. 0: RAM test is disabled. 1: RAM test is enabled. |
| 1 | Reserved | B'0 | R | When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 0 | ICBCTME | B'0 | R/W | Communication Test between Channels Enable When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 or 1) in the RSCFDnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode. 0: Communication test between channels disabled 1: Communication test between channels enabled |

48.7.13.3 RSCFDnGLOCKK — Global Lock Key Register

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnGLOCKK register can be written only in 32-bit units

RSCFDnGLOCKKL, RSCFDnGLOCKKH registers can be written only in 16-bit units

Address: RSCFDnGLOCKK: <RSCFDn_base> + H'047C

RSCFDnGLOCKKL: <RSCFDn_base> + H'047C, RSCFDnGLOCKKH: <RSCFDn_base> + H'047E

Value after reset: H'0000_0000

| | | | | | | | | | | | | | | | | |
|----------------|------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | LOCK[15:0] | | | | | | | | | | | | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* | W* |

Note: * Writing to these bits is effective only when the RS-CANFD module is in global test mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 16 | Reserved | All 0 | R | When writing to these bits, write the value after reset. |
| 15 to 0 | LOCK[15:0] | H'0000 | W* | <p>Lock Key</p> <p>Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnGTSTCTR register.</p> <p>After the protection has been released, writing to the I/O register area (<RSCFDn_base> + H'0000 to <RSCFDn_base> + H'04FF) of the CAN (except the RAM) enables the protection again.</p> <p>Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.</p> |

The RSCFDnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see section 48.16.4.2, Procedure for Releasing the Protection.

48.7.13.4 RSCFDnRPGACCr — RAM Test Page Access Register (r = 0 to 63)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnRPGACCr register can be read/written in 32-bit units

RSCFDnRPGACCrL, RSCFDnRPGACCrH registers can be read/written in 16-bit units

RSCFDnRPGACCrLL, RSCFDnRPGACCrLH, RSCFDnRPGACCrHL, RSCFDnRPGACCrHH registers can be read/written in 8-bit units

Address: RSCFDnRPGACCr: <RSCFDn_base> + H'1900 + (H'04 × r)
 RSCFDnRPGACCrL: <RSCFDn_base> + H'1900 + (H'04 × r),
 RSCFDnRPGACCrH: <RSCFDn_base> + H'1902 + (H'04 × r)
 RSCFDnRPGACCrLL: <RSCFDn_base> + H'1900 + (H'04 × r),
 RSCFDnRPGACCrLH: <RSCFDn_base> + H'1901 + (H'04 × r),
 RSCFDnRPGACCrHL: <RSCFDn_base> + H'1902 + (H'04 × r),
 RSCFDnRPGACCrHH: <RSCFDn_base> + H'1903 + (H'04 × r)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 0 | RDTA[31:0] | H'0000_0000 | R/W | RAM Data Test Access Data can be read and written in RSCAN RAM. These bits are read as 0. The write value should be 0. |

Modify the RSCFDnRPGACCr register in global test mode with the RTME bit in the RSCFDnGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnRPGACCr register is readable and writable when the RTME bit is set to 1.

48.8 Registers Configuration (CAN FD mode)

This section describes all RS-CANFD registers used in CAN FD mode.

48.8.1 List of Registers

Table 48.16 lists the RS-CANFD registers used in CAN FD mode.

For details about <RSCFDn_base>, see section 48.5.1, Register Base Address.

Table 48.16 Registers

| Channel | Name | Abbreviation | R/W | Offset Address | Size | Second Generation RZ/G Series Products | | | |
|----------------------|--|------------------------|-----|---------------------|------|---|----------------------------|--------|--------|

| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 1 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 0 | RCMC | B'0 | R/W | Interface Mode Select Setting this bit to 1 places the CANFD into CAN FD mode. To place the RS-CANFD module from classical CAN mode to CAN FD mode, modify the RSCFDnCFDGRMCFG register after setting the post-reset values to all the registers and bits that are solely assigned to the register map used in classical CAN mode. 0: Classical CAN mode 1: CAN FD mode |

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Also set the register before setting any other RS-CANFD register.

48.9.2 Details of Channel Related Registers

48.9.2.1 RSCFDnCFDCmNCFG — Channel Normal Bit Rate Configuration Register (m = 0 or 1)

| | | | |
|--------|--------------------------|--------|--------|

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 31 | ROM | B'0 | R/W | <p>Limited Operation Mode Enable</p> <p>This bit is used to enable the limited operation mode when the ROM and CTME bits in the RSCFDnCFDCmCTR register are set to 1. Use the limited operation mode only when the CTMS[1:0] bits in the SCFDnCFDCmCTR register are B'00 (standard test mode). Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.</p> <p>0: Limited operation mode is disabled. 1: Limited operation mode is enabled.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|---|
| 30 | CRCT | B'0 | R/W | <p>CRC Error Test Enable</p> <p>This bit is used to test the CRC generator circuit in the RS-CANFD module. Setting this bit to 1 allows the first bit in the ID field to be reversed when a message is received. Due to the bit reversal, the CRC calculation result does not agree with the correct CRC value of the received frame. A CRC error is thus detected (the CERR bit in the RSCFDnCFDCmERFL register is 1). Note the following when using this function:</p> <ul style="list-style-type: none"> • This function is available when the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled). • Communicating with another CAN node is impossible. Use the function in the inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1). • Bit reversal in the ID field may violate the bit stuffing rule. In this case, a stuff error is detected instead of a CRC error. <p>Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.</p> <p>0: The first bit in the receive ID field is not reversed. 1: The first bit in the receive ID field is reversed.</p> |
| 29 to 27 | Reserved | All 0 | R | <p>These bits are read as the value after reset. The write value should be the value after reset.</p> |
| 26, 25 | CTMS[1:0] | B'00 | R/W | <p>Communication Test Mode Select</p> <p>These bits are used to select a communication test mode. Modify these bits only in channel halt mode.</p> <p>These bits are set to 0 in channel reset mode.</p> <p>B'00: Standard test mode B'01: Listen-only mode B'10: Self-test mode 0 (external loopback mode) B'11: Self-test mode 1 (internal loopback mode)</p> |
| 24 | CTME | B'0 | R/W | <p>Communication Test Mode Enable</p> <p>Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.</p> <p>0: Communication test mode is disabled. 1: Communication test mode is enabled.</p> |
| 23 | ERRD | B'0 | R/W | <p>Error Display Mode Select</p> <p>This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register.</p> <p>When this bit is clear to 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.</p> <p>When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.</p> <p>Modify this bit only in channel reset mode or channel halt mode.</p> <p>0: Error flags are displayed only for the first error information after bits 14 to 8 in RSCFDnCFDCmERFL are all cleared. 1: Error flags for all error information are displayed.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 22, 21 | BOM[1:0] | B'00 | R/W | <p>Bus Off Recovery Mode Select</p> <p>These bits are used to select the bus off recovery mode of the RS-CANFD module.</p> <p>When the BOM[1:0] bits are set to B'00, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to B'10 (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.</p> <p>When the module reaches the bus off state when the BOM[1:0] bits are set to B'01, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register ($m = 0$ or 1) are set to B'10 and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to H'00.</p> <p>When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to B'10, the CHMDC[1:0] bits are set to B'10 and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H'00.</p> <p>When the BOM[1:0] bits are set to B'11 and the CHMDC[1:0] bits are set to B'10 while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to H'00. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to B'10, a bus off recovery interrupt request is generated.</p> <p>If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are B'01 or at bus off end when the BOM[1:0] bits are B'10), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.</p> <p>B'00: ISO11898-1 compliant B'01: Entry to channel halt mode automatically at bus-off entry B'10: Entry to channel halt mode automatically at bus-off end B'11: Entry to channel halt mode (in bus-off state) by program request</p> |
| 20 | Reserved | B'0 | R | <p>This bit is read as the value after reset.</p> <p>The write value should be the value after reset.</p> |
| 19 | TDCVFIE | B'0 | R/W | <p>Transmit Delay Correction Violation Interrupt Enable</p> <p>When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 with the TDCVFIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.</p> <p>0: Transmit delay correction violation interrupt is disabled. 1: Transmit delay correction violation interrupt is enabled.</p> |

| 8 | SERR | B'0 | R/W | <p>Stuff Error Flag</p> <p>This flag is set to 1 when a stuff error has been detected.</p> <p>0: No stuff error is detected.</p> <p>1: Stuff error is detected.</p> |
| 7 | ALF | B'0 | R/W | <p>Arbitration-lost Flag</p> <p>This flag is set to 1 when an arbitration-lost has been detected.</p> <p>0: No arbitration-lost is detected.</p> <p>1: Arbitration-lost is detected.</p> |
| 6 | BLF | B'0 | R/W | <p>Bus Lock Flag</p> <p>This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a dominant lock is restarted when either of the following conditions is met.</p> <ul style="list-style-type: none"> • A recessive bit is detected after the BLF bit has been cleared from 1 to 0. • The RS-CANFD module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0. <p>0: No channel bus is detected.</p> <p>1: Channel bus is detected.</p> |
| 5 | OVLF | B'0 | R/W | <p>Overload Flag</p> <p>This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.</p> <p>0: No overload is detected.</p> <p>1: Overload is detected.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 4 | BORF | B'0 | R/W | <p>Bus Off Recovery Flag</p> <p>This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the RS-CANFD module returns from the bus off state. However, this flag is not set to 1 if the RS-CANFD module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.</p> <ul style="list-style-type: none"> The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to B'01 (channel reset mode). The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state is made). The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to B'01 (transition to channel halt mode at bus off entry). The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to B'10 (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to B'11 (transition to channel halt mode upon a request from the program during bus off). <p>0: No bus off recovery is detected. 1: Bus off recovery is detected.</p> |
| 3 | BOEF | B'0 | R/W | <p>Bus Off Entry Flag</p> <p>This flag is set to 1 when the bus off state is reached (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is reached when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 or 1) set to B'01 (transition to channel halt mode at bus off entry).</p> <p>0: No bus off entry is detected. 1: Bus off entry is detected.</p> |
| 2 | EPF | B'0 | R/W | <p>Error Passive Flag</p> <p>This flag becomes 1 when the error passive state is reached (REC[7:0] or TEC[7:0] value > 127). This flag becomes 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC[7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.</p> <p>0: No error passive is detected. 1: Error passive is detected.</p> |
| 1 | EWF | B'0 | R/W | <p>Error Warning Flag</p> <p>This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC[7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.</p> <p>0: No error warning is detected. 1: Error warning is detected.</p> |
| 0 | BEF | B'0 | R/W | <p>Bus Error Flag</p> <p>This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.</p> <p>0: No channel bus error is detected. 1: Channel bus error is detected.</p> |

Note: To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 0 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set by the error event if bits 14 to 8 were all 0 at the when time the error occurred.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------|---------------|-----|--|
| 31 to 21 | Reserved | All 0 | R | Reserved These bits are read as 0. The write value should be 0. |
| 20 to 0 | CRCREG [20:0] | H'00_0000 | R | CRC Calculation Data (17-bit or 21-bit CRC length) When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if the transmit or receive message is in the CAN FD frame (17-bit or 21-bit CRC length), these flags are updated and the CRC value calculated based on the transmit or receive message can be read. When the message has the 17-bit CRC length, bits 20 to 17 are always read as 0. When the classical CAN frame is transmitted or received, the CRCREG[14:0] bits in the RSCFDnCFDCmERFL register are updated. When the CTME bit is cleared to 0 (communication test mode is disabled), these bits are always read as 0. |

48.9.3 Details of Global Related Registers

48.9.3.1 RSCFDnCFDGCFCFG — Global Configuration Register

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCFDGCFCFG register can be read/written in 32-bit units

RSCFDnCFDGCFCFGL, RSCFDnCFDGCFCFGH registers can be read/written in 16-bit units

RSCFDnCFDGCFCFGLL, RSCFDnCFDGCFCFGLH, RSCFDnCFDGCFCFGLH, RSCFDnCFDGCFCFGLH, RSCFDnCFDGCFCFGLH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCFCFG: <RSCFDn_base> + H'0084

RSCFDnCFDGCFCFGL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFCFGH: <RSCFDn_base> + H'0086

RSCFDnCFDGCFCFGLL: <RSCFDn_base> + H'0084, RSCFDnCFDGCFCFGLH: <RSCFDn_base> + H'0085,

RSCFDnCFDGCFCFGLH: <RSCFDn_base> + H'0086, RSCFDnCFDGCFCFGLH: <RSCFDn_base> + H'0087

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 to 16 | ITRCP[15:0] | H'0000 | R/W | Interval Timer Prescaler Set These bits are used to set a clock source division value of the interval timer for FIFO buffers. See section 48.13.3.1, Interval Transmission Function. When these bits are set to M, the pclk is divided by M. Setting H'0000 is prohibited when the interval timer is in use. |
| 15 to 13 | TSBTCS[2:0] | B'000 | R/W | Timestamp Clock Source Select When the TSSS bit is 1, these bits are used to select the channel of the normal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel which handles the CAN FD frame. B'000: Channel 0 bit time clock B'001: Channel 1 bit time clock B'010: Setting prohibited B'011: Setting prohibited B'100: Setting prohibited B'101: Setting prohibited B'110: Setting prohibited B'111: Setting prohibited |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 12 | TSSS | B'0 | R/W | <p>Timestamp Source Select</p> <p>This bit is used to select a clock source of the timestamp counter. If there is no channel which handles the classical CAN frame only, select pclk.</p> <p>0: pclk/2*1 1: Normal bit time clock</p> |
| 11 to 8 | TSP[3:0] | B'0000 | R/W | <p>Timestamp Clock Source Division</p> <p>A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.</p> <p>B'0000: Not divided B'0001: Divided by 2 B'0010: Divided by 4 B'0011: Divided by 8 B'0100: Divided by 16 B'0101: Divided by 32 B'0110: Divided by 64 B'0111: Divided by 128 B'1000: Divided by 256 B'1001: Divided by 512 B'1010: Divided by 1024 B'1011: Divided by 2048 B'1100: Divided by 4096 B'1101: Divided by 8192 B'1110: Divided by 16384 B'1111: Divided by 32768</p> |
| 7, 6 | Reserved | All 0 | R | <p>These bits are read as the value after reset. The write value should be the value after reset.</p> |
| 5 | CMPOC | B'0 | R/W | <p>Payload Overflow Mode Select</p> <p>This bit is used to select the operation when the payload length of the received message exceeds the size for storing the payload in the storage buffer.</p> <p>When this bit is 0, the received message that the payload overflows is not stored in the buffer.</p> <p>When this bit is 1, the received message that the payload overflows is stored in the buffer. The payload which exceeds the size for storing the payload in the buffer is truncated.</p> <p>The size for storing the payload in the buffer is specified with the following bits.</p> <ul style="list-style-type: none"> • Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register • Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register • Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register <p>0: Messages are not stored. 1: Messages are stored and the payload which exceeds the buffer size is truncated.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 4 | DCS | B'0 | R/W | <p>CAN Clock Source Select*2</p> <p>When this bit is set to 0, clk is used as the clock source of the CAN clock (fCAN).</p> <p>When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).</p> <p>For the CAN clock frequency settings, see section 48.16.1.3, Setting Communication Speed.</p> <p>0: clk 1: clk_xincan</p> |
| 3 | MME | B'0 | R/W | <p>Mirror Function Enable</p> <p>Setting this bit to 1 makes the mirror function available.</p> <p>0: Mirror function is disabled. 1: Mirror function is enabled.</p> |
| 2 | DRE | B'0 | R/W | <p>DLC Replacement Enable</p> <p>When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of H'00 is stored in each data byte beyond the DLC value of the receive rule.</p> <p>The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).</p> <p>0: DLC replacement is disabled. 1: DLC replacement is enabled.</p> |
| 1 | DCE | B'0 | R/W | <p>DLC Check Enable</p> <p>Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to B'0000 before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.</p> <p>0: DLC check is disabled. 1: DLC check is enabled.</p> |
| 0 | TPRI | B'0 | R/W | <p>Transmit Priority Select</p> <p>This bit is used to set the transmit priority.</p> <p>When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the lowest transmit buffer number of those has the highest priority.</p> <p>While the transmit queue is in use, this bit should be set to 0.</p> <p>0: ID priority 1: Transmit buffer number priority</p> |

Notes: 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to B'000.
2. For the CAN clock frequency settings, see section 48.16.1.3, Setting Communication Speed.

Modify the RSCFDnCFDGCFG register only in global reset mode.

48.9.3.2 RSCFDnCFDGCTR — Global Control Register

Note: * The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 18 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 17 | EEF1 | B'0 | R/W | ECC Error Flag for Channel 1 The EEF1 flag is set to 1 disabling message transmission if an ECC2 bit error is detected in transmit priority selection of channel 1. To clear this flag to 0, the program must write 0 to the flag. 0: No 2-bit ECC error has occurred in transmit priority selection. 1: A 2-bit ECC error has occurred in transmit priority selection. |
| 16 | EEF0 | B'0 | R/W | ECC Error Flag for Channel 0 The EEF0 flag is set to 1 disabling message transmission if an ECC2 bit error is detected in transmit priority selection of channel 0. To clear this flag to 0, the program must write 0 to the flag. 0: No 2-bit ECC error has occurred in transmit priority selection. 1: A 2-bit ECC error has occurred in transmit priority selection. |
| 15, 14 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 13 to 8 | Reserved | Undefined | R | When read, an undefined value is returned. When writing to these bits, write the value after reset. |
| 7, 6 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 5 | Reserved | Undefined | R | When read, an undefined value is returned. When writing to this bit, write the value after reset. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 4 | Reserved | B'0 | R | When read, the value after reset is returned. When writing to this bit, write the value after reset. |
| 3 | CMPOF | B'0 | R/W | Payload Overflow Flag If a payload overflow occurs in channel m (m = 0 or 1), the CMPOF flag is set to 1. To clear this flag to 0, the program must write 0 to the flag. 0: No payload overflow occurs. 1: A payload overflow occurs. |
| 2 | THLES | B'0 | R | Transmit History Buffer Overflow Status Flag The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0, 1) is set to 1. This flag is cleared to 0 when the THLELT flags of all channels are set to 0. 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred. |
| 1 | MES | B'0 | R | FIFO Message Lost Status Flag The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 5) is set to 1. This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0. 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred. |
| 0 | DEF | B'0 | R/W | DLC Error Flag The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit. 0: No DLC error has occurred. 1: A DLC error has occurred. |

Note: To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|------------|---------------|-----|--|
| 31 to 9 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 8 | AFLDAE | B'0 | R/W | Receive Rule Table Write Enable Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit. Set the AFLDAE bit to 1 only in global reset mode. 0: Receive rule table write is disabled. 1: Receive rule table write is enabled. |
| 7 to 5 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 4 to 0 | AFLPN[4:0] | B'0_0000 | R/W | Receive Rule Table Page Number Configuration These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page. A page number can be selected from a range of page 0 (B'0_0000) to page 23 (B'1_0111). Set these bits to a value within the range of B'0_0000 to B'1_0111. |

48.9.4.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units

RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units

RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL,

RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + H'009C

RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + H'009C,

RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + H'009E

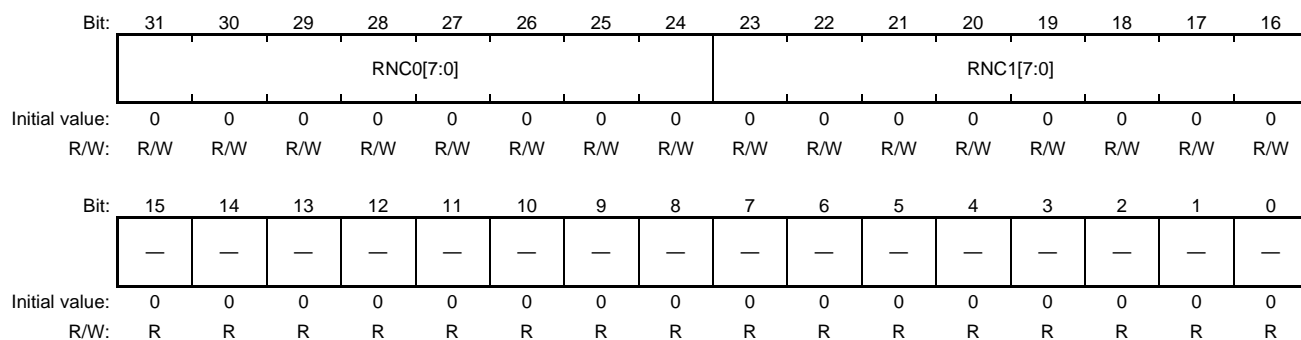

RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + H'009C,

RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + H'009D,

RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + H'009E,

RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + H'009F

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 24 | RNC0[7:0] | H'00 | R/W | Number of Rules for Channel 0 These bits are used to set the number of rules to be registered in the channel 0 receive rule table. Set these bits to a value within the range of H'00 to H'80. |
| 23 to 16 | RNC1[7:0] | H'00 | R/W | Number of Rules for Channel 1 These bits are used to set the number of rules to be registered in the channel 1 receive rule table. Set these bits to a value within the range of H'00 to H'80. |
| 15 to 0 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to $64 \times$ (number of channels) rules can be registered in the receive rule table as the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total of the number of rules allocated to each channel is not larger than the number of rules that can be registered in the entire unit.

48.9.4.3 RSCFDnCFDGAFLCFG1 — Receive Rule Configuration Register 1

48.9.4.4 RSCFDnCFDGAFLIDj — Receive Rule ID Register (j = 0 to 15)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units

RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units

RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLIDj: <RSCFDn_base> + H'1000 + (H'10 × j)

RSCFDnCFDGAFLIDjL: <RSCFDn_base> + H'1000 + (H'10 × j),

RSCFDnCFDGAFLIDjH: <RSCFDn_base> + H'1002 + (H'10 × j)

RSCFDnCFDGAFLIDjLL: <RSCFDn_base> + H'1000 + (H'10 × j),

RSCFDnCFDGAFLIDjLH: <RSCFDn_base> + H'1001 + (H'10 × j),

RSCFDnCFDGAFLIDjHL: <RSCFDn_base> + H'1002 + (H'10 × j),

RSCFDnCFDGAFLIDjHH: <RSCFDn_base> + H'1003 + (H'10 × j)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 31 | GAFLIDE | B'0 | R/W | IDE Select This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing. 0: Standard ID 1: Extended ID |
| 30 | GAFLRTR | B'0 | R/W | RTR Select This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing. 0: Data frame 1: Remote frame |
| 29 | GAFLLB | B'0 | R/W | Receive Rule Target Message Select When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node. When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages. 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|--------------|---------------|-----|---|
| 28 to 0 | GAFLID[28:0] | H'0000_0000 | R/W | ID Set These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing. For the standard ID, set the ID in bits 10 to 0 and set bits 28 to 11 to 0. |

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

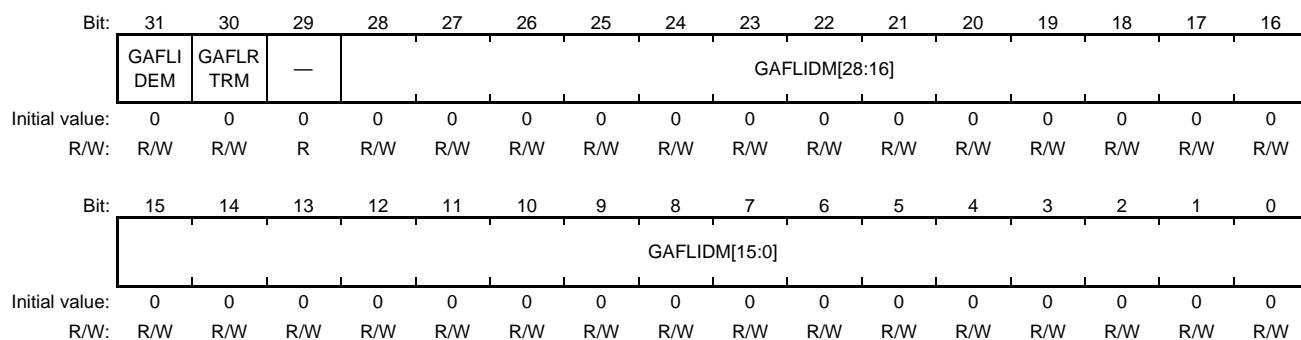

48.9.4.5 RSCFDnCFDGAFLMj — Receive Rule Mask Register (j = 0 to 15)

RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + H'100F + (H'10 × j)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|--------------------|---------------|-----|--|
| 31 to 26 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 25 to 16 | GAFLFDP [25:16] | H'000 | R/W | Transmit/Receive FIFO Buffer k Select (Bit position – 8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected. |
| 15 to 0 | GAFLFDP [15:0] | H'0000 | R/W | Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected. |

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLP1_j register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[25:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers are selectable. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (a message is stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDGFCCk register are set to B'00 (receive mode) or B'10 (gateway mode) are selectable.

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | RMNSq | H'0000_0000 | R/W | Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. |

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 31)

Each RMNS flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be cleared to 0 while a message is being stored. Time for storing a message differs depending on the size for storing the payload in the receive buffer; it takes 12 clock cycles of pclk when the RMPLS[1:0] bits in the RSCFDnCFDRMNB register are B'00 (8 bytes) and 18 clock cycles of pclk when the RMPLS[1:0] bits are B'11 (20 bytes) (two clock cycles of pclk for four bytes of the size for storing the payload).

These flags are cleared to 0 in global reset mode.

48.9.5.3 RSCFDnCFDRMIDq — Receive Buffer ID Register (q = 0 to 31)

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|--|
| 31 to 24 | RMDB4 × b + 3 [7:0] | H'00 | R | Receive Buffer Data Byte 4 × b + 3 |
| | | | | Receive Buffer Data Byte 4 × b + 2 |
| 23 to 16 | RMDB4 × b + 2 [7:0] | H'00 | R | Receive Buffer Data Byte 4 × b + 1 |
| | | | | Receive Buffer Data Byte 4 × b + 0 |
| 15 to 8 | RMDB4 × b + 1 [7:0] | H'00 | R | Data for a message stored in the receive buffer can be read. |
| 7 to 0 | RMDB4 × b + 0 [7:0] | H'00 | R | |

When the RMDLC[3:0] bit values in the RSCFDnCFDRMPTRq register are smaller than the size for storing the payload in the receive buffer, data bytes for which no data is set are read as H'00.

The size for storing the payload in the receive buffer is specified with the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. The RSCFDnCFDRMDFb_q register corresponding to the area which exceeds the specified size must not be read or written.

48.9.6 Details of Receive FIFO Buffer Related Registers

48.9.6.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register (x = 0 to 7)

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W* | R/W* | R | R |

Note: * The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-----------|---------------|-----|--|
| 31 to 16 | Reserved | All 0 | R | These bits are read as the value after reset. When writing to these bits, write the value after reset. |
| 15 to 8 | RFMC[7:0] | H'00 | R | Receive FIFO Unread Message Counter This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes H'00 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0. |
| 7 to 4 | Reserved | All 0 | R | These bits are read as the value after reset. When writing to these bits, write the value after reset. |
| 3 | RFIF | B'0 | R/W | Receive FIFO Interrupt Request Flag This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode. To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1". 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|--|
| 2 | RFMLT | B'0 | R/W | <p>Receive FIFO Message Lost Flag</p> <p>This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.</p> <p>This flag is cleared to 0 in global reset mode or by writing 0 to this flag.</p> <p>Modify this bit in global operating mode or global test mode.</p> <p>To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.</p> <p>When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".</p> <p>0: No receive FIFO message is lost. 1: A receive FIFO message is lost.</p> |
| 1 | RFFLL | B'0 | R | <p>Receive FIFO Buffer Full Status Flag</p> <p>This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.</p> <p>If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.</p> <p>0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.</p> |
| 0 | RFEMP | B'1 | R | <p>Receive FIFO Buffer Empty Status Flag</p> <p>This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.</p> <p>This flag is cleared to 0 when even a single received message has been stored in the receive FIFO buffer.</p> <p>0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).</p> |

Note: To clear the RFMLT or RFIF flag to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

48.9.6.3 RSCFDnCFDRFPCTR_x — Receive FIFO Buffer Pointer Control Register (x = 0 to 7)

| 7 to 0 | RFDB4 × d + 0 [7:0] | H'00 | R | Receive FIFO Buffer Data Byte 4 × d + 0 |

Data for a message stored in the receive FIFO buffer can be read.

When the RFDLC[3:0] bit values in the RSCFDnCFDRFPTRx register are smaller than the size for storing the payload in the receive FIFO buffer, data bytes for which no data is set are read as H'00.

The size for storing the payload in the receive FIFO buffer is specified with the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register. The RSCFDnCFDRFDFd_x register corresponding to the area which exceeds the specified size must not be read or written.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 24 | CFITT[7:0] | H'00 | R/W | Set a message transmission interval. These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to B'01 (transmit mode) or B'10 (gateway mode). Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits. Set Value: H'00 to H'FF |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 23 to 20 | CFTML[3:0] | H'0 | R/W | <p>Transmit Buffer Link Configuration</p> <p>These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to B'01 (transmit mode) or B'10 (gateway mode).</p> <p>There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as $m = k/3$ (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be $((16 \times m) + CFTML[3:0])$.</p> <p>See Table 48.17 and Table 48.18, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.</p> <p>Setting the CFDC[2:0] bits to B'001 or more enables the setting of the CFTML[3:0] bits.</p> <p>Do not link to any transmit buffer which is already allocated to a transmit queue on the identical channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.</p> |
| 19 | CFITR | B'0 | R/W | <p>Transmit/Receive FIFO Interval Timer Resolution</p> <p>This bit is enabled when the CFITSS bit is 0.</p> <p>When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.</p> <p>When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register $\times 10$).</p> <p>Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).</p> <p>0: Clock dividing pclk/2 by (ITRCP[15:0] bits) 1: Clock dividing pclk/2 by (ITRCP[15:0] bits $\times 10$)</p> |
| 18 | CFITSS | B'0 | R/W | <p>Transmit/Receive FIFO Interval Timer Clock Source Select</p> <p>When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.</p> <p>When this bit is 1, the normal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.</p> <p>Use this bit only for a channel which does not handle the CAN FD frame.</p> <p>Modify this bit while the CFE bit is cleared to 0 (no transmit/receive FIFO buffer is used).</p> <p>0: Interval timer clock source selected by the CFITR bit 1: Interval timer clock source is the normal bit time clock for the channel to which the FIFO is linked.</p> |
| 17, 16 | CFM[1:0] | B'00 | R/W | <p>Transmit/Receive FIFO Mode Select</p> <p>These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.</p> <p>B'00: Receive mode B'01: Transmit mode B'10: Gateway mode B'11: Setting prohibited</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 15 to 13 | CFIGCV[2:0] | B'000 | R/W | <p>Transmit/Receive FIFO Receive Interrupt Request Timing Select</p> <p>These bits are used to specify the number of received messages for generating a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to B'00 (receive mode) or B'10 (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).</p> <p>When the CFDC[2:0] bits are set to B'001 (4 messages), set the CFIGCV[2:0] bits to B'001, B'011, B'101, or B'111.</p> <p>Modify these bits only in global reset mode.</p> <p>B'000: When FIFO is 1/8 full. B'001: When FIFO is 2/8 full. B'010: When FIFO is 3/8 full. B'011: When FIFO is 4/8 full. B'100: When FIFO is 5/8 full. B'101: When FIFO is 6/8 full. B'110: When FIFO is 7/8 full. B'111: When FIFO is full.</p> |
| 12 | CFIM | B'0 | R/W | <p>Transmit/Receive FIFO Interrupt Source Select</p> <p>This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.</p> <p>0:</p> <ul style="list-style-type: none"> Receive mode/gateway mode When the number of received messages has met the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. <p>1:</p> <ul style="list-style-type: none"> Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted. |
| 11 | Reserved | B'0 | R | <p>This bit is read as the value after reset.</p> <p>The write value should be the value after reset.</p> |
| 10 to 8 | CFDC[2:0] | B'000 | R/W | <p>Transmit/Receive FIFO Buffer Depth Configuration</p> <p>These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to B'000, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.</p> <p>B'000: 0 messages B'001: 4 messages B'010: 8 messages B'011: 16 messages B'100: 32 messages B'101: 48 messages B'110: 64 messages B'111: 128 messages</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|------------|---------------|-----|--|
| 7 | Reserved | B'0 | R | This bit is read as the value after reset. The write value should be the value after reset. |
| 6 to 4 | CFPLS[2:0] | B'000 | R/W | Transmit/Receive FIFO Buffer Payload Storing Size Select These bits are used to select the upper-limited size of the payload which can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode. B'000: 8 bytes B'001: 12 bytes B'010: 16 bytes B'011: 20 bytes B'100: 24 bytes B'101: 32 bytes B'110: 48 bytes B'111: 64 bytes |
| 3 | Reserved | B'0 | R | This bit is read as the value after reset. The write value should be the value after reset. |
| 2 | CCTXIE | B'0 | R/W | Transmit/Receive FIFO Transmit Interrupt Enable When this bit is set to 1 and the CCTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated. Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used). 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled. |
| 1 | CFRXIE | B'0 | R/W | Transmit/Receive FIFO Receive Interrupt Enable When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated. Modify this bit with the CFE bit set to 0. 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled. |
| 0 | CFE | B'0 | R/W | Transmit/Receive FIFO Buffer Enable Setting this bit to 1 makes transmit/receive FIFO buffers available. When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately. This bit is cleared to 0 when the following conditions are met. <ul style="list-style-type: none"> • Receive mode: Global reset mode • Transmit mode or gateway mode: Channel reset mode Modify this bit in the following mode. <ul style="list-style-type: none"> • Receive mode: Global operating mode or global test mode • Transmit mode or gateway mode: Channel communication mode or channel halt mode First set all the other bits in the RSCFDnCFDCFCCk register and then set this bit to 1 using another instruction. 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used. |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 3 | Reserved | All 0 | R | These bits are read as the value after reset. |
| 2 | CFFDF | B'0 | R/W | <p>CFFDF</p> <p>When the CFM[1:0] bits are B'00, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] bits are B'01, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.</p> <p>0: Classical CAN frame 1: CAN FD frame</p> |
| 1 | CFBRS | B'0 | R/W | <p>CFBRS</p> <p>When the CFM[1:0] bits are B'00, this bit indicates the BRS bit value of the receive message stored in the transmit/receive FIFO buffer if the CFFDF bit is 1. This bit is always read as 0 if the CFFDF bit is 0.</p> <p>When the CFM[1:0] bits are B'01, this bit is used to set the BRS bit value of the message transmitted from the transmit/receive FIFO buffer if the CFFDF bit is 1. Write 0 to this bit if the CFFDF bit is 0.</p> <p>0: The bit rate in the data area is not changed. 1: The bit rate in the data area is changed.</p> |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 0 | CFESI | B'0 | R/W | <p>CFESI</p> <p>When the CFM[1:0] bits are B'00, this bit indicates the ESI bit value of the receive message stored in the transmit/receive FIFO buffer if the CFFDF bit is 1. This bit is always read as 0 if the CFFDF bit is 0.</p> <p>When the CFM[1:0] bits are B'01, this bit is used to set the ESI bit value of the message transmitted from the transmit/receive FIFO buffer if the CFFDF bit is 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is 1 and the channel is in error-active state. When the channel is in error-passive state, the ESI bit value indicating the error-passive node is transmitted regardless of this bit. Write 0 to this bit if the CFFDF bit is 0.</p> <p>0: Error-active node 1: Error-passive node</p> |

This register is writable only when the CFM[1:0] bits in the RSCFDnCFDCFCCK register are B'01 (transmit mode). This register is readable only when the CFM[1:0] bits are B'00 (receive mode). This register should not be read or written when the CFM[1:0] bits are B'10 (gateway mode).

48.9.7.7 RSCFDnCFDCFDf_k — Transmit/receive FIFO Buffer Access Data Field d Register (d = 0 to 15, k = 0 to 5)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCFDCFDf_k register can be read/written in 32-bit units

RSCFDnCFDCFDf_kL, RSCFDnCFDCFDf_kH registers can be read/written in 16-bit units

RSCFDnCFDCFDf_kLL, RSCFDnCFDCFDf_kLH, RSCFDnCFDCFDf_kHL, RSCFDnCFDCFDf_kHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFDf_k: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k)

RSCFDnCFDCFDf_kL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),

RSCFDnCFDCFDf_kH: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k)

RSCFDnCFDCFDf_kLL: <RSCFDn_base> + H'340C + (H'04 × d) + (H'80 × k),

RSCFDnCFDCFDf_kLH: <RSCFDn_base> + H'340D + (H'04 × d) + (H'80 × k),

RSCFDnCFDCFDf_kHL: <RSCFDn_base> + H'340E + (H'04 × d) + (H'80 × k),

RSCFDnCFDCFDf_kHH: <RSCFDn_base> + H'340F + (H'04 × d) + (H'80 × k)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|---------------------|---------------|-----|---|
| 31 to 24 | CFDB4 × d + 3 [7:0] | H'00 | R/W | Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 |
| 23 to 16 | CFDB4 × d + 2 [7:0] | H'00 | R/W | Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 |
| 15 to 8 | CFDB4 × d + 1 [7:0] | H'00 | R/W | • When CFM[1:0] value is B'01 (transmit mode): Set the transmit/receive FIFO buffer data. |
| 7 to 0 | CFDB4 × d + 0 [7:0] | H'00 | R/W | • When CFM[1:0] value is B'00 (receive mode): The message data stored in the transmit/receive FIFO buffer can be read. |

This register is writable only when the CFM[1:0] bits in the RSCFDnCFDCFCCK register are B'01.

This register is readable only when the CFM[1:0] bits are B'00. When the CFDLC[3:0] bit values in the RSCFDnCFDCFPTRk register are smaller than the size for storing the payload in the transmit/receive FIFO buffer, data bytes for which no data is set are read as H'00.

The size for storing the payload in the transmit/receive FIFO buffer is specified with the CFPLS[2:0] bits in the RSCFDnCFDCFCCK register. The RSCFDnCFDCFDf_k register, which corresponds to the larger area than the specified size, should not be read or written.

This register should not be read or written when the CFM[1:0] bits are B'10 (gateway mode).

Modify the RSCFDnCFDCDTCT register only in global operating mode or global test mode.

CFDMAEm Bits

The DMA transfer for transmit/receive FIFO buffer $3 \times m$ (the first transmit/receive FIFO buffer assigned to channel m) is enabled. The DMA transfer is only enabled for the transmit/receive FIFO buffer in which the CFM[1:0] bits in the RSCFDnCFDCFCCK register have been set to B'00 (receive mode). Set these bits to 0 when the CFM[1:0] bits are B'01 (transmit mode) or B'10 (gateway mode).

48.9.9.2 RSCFDnCFDCDTSTS — DMA Status Register

| 7 | RFDMASTS7 | B'0 | R | Receive FIFO Buffer x DMA Status |
| 6 | RFDMASTS6 | B'0 | R | When the DMA transfer for receive FIFO buffer x is enabled (the RFDMAEx bit corresponding to the RSCFDnCFDCDTCT register is 1) and there is a message in the receive FIFO buffer, the RFDMAEx bit becomes 1 and indicates that the DMA is being transferred. When all messages in receive FIFO buffer x are transferred or the DMA transfer is disabled (the RFDMAEx bit is 0), the RFDMASTSx bit becomes 0 and indicates that the DMA transfer completed. When the RFDMAEx bit is cleared to 0 during DMA transfer, the RFDMASTSx bit becomes 0 after the DMA transfer in execution has completed (the message has been transferred to the last byte in the payload storage area). 0: The DMA for receive FIFO buffer x is not being transferred. 1: The DMA for receive FIFO buffer x is being transferred. (x = 0 to 7) |
| 5 | RFDMASTS5 | B'0 | R | |
| 4 | RFDMASTS4 | B'0 | R | |
| 3 | RFDMASTS3 | B'0 | R | |
| 2 | RFDMASTS2 | B'0 | R | |
| 1 | RFDMASTS1 | B'0 | R | |
| 0 | RFDMASTS0 | B'0 | R | |

CFDMASTS_m Bits

When the DMA transfer for transmit/receive FIFO buffer $3 \times m$ (the first transmit/receive FIFO buffer assigned to channel m) is enabled (the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) and there is a message in the transmit/receive FIFO buffer, the CFDMASTS_m bit becomes 1 and indicates that the DMA is being transferred.

When all messages in the transmit/receive FIFO buffer are transferred or the DMA transfer is disabled (the CFDMAEm bit is 0), the CFDMASTS_m bit becomes 0 and indicates that the DMA transfer completed. When the CFDMAEm bit is cleared to 0 during DMA transfer, the CFDMASTS_m bit becomes 0 after the DMA transfer in execution has completed (the message has been transferred to the last byte in the payload storage area).

48.9.10 Details of Transmit Buffer Related Registers

48.9.10.1 RSCFDnCFDTMCp — Transmit Buffer Control Register (p = 0 to 31)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

Access: RSCFDnCFDTMCp register can be read/written in 8-bit units

Address: RSCFDnCFDTMCp: <RSCFDn_base> + H'0250 + (H'01 × p)

Value after reset: H'00

| | | | | | | | | |
|------|---|---|---|---|---|------|-------|------|
| Bit: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | TMOM | TMTAR | TMTR |

Initial value: 0 0 0 0 0 0 0 0

R/W: R R R R R R/W R/W* R/W*

Note: * The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|---|
| 7 to 3 | Reserved | All 0 | R | These bits are read as the value after reset. The write value should be the value after reset. |
| 2 | TMOM | B'0 | R/W | One-Shot Transmission Enable Setting this bit to 1 enables one-shot transmission. When transmission fails, retransmission defined in the CAN protocol is not performed. Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit. 0: One-shot transmission is disabled. 1: One-shot transmission is enabled. |
| 1 | TMTAR | B'0 | R/W | Transmit Abort Request Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted. The TMTAR bit can be set to 1 when TMTR bit is 1. The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit. <ul style="list-style-type: none"> • Transmission has been completed. • Transmit abort has been completed. • An error or arbitration loss has been detected. If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0. 0: Transmit abort is not requested. 1: Transmit abort is requested. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 0 | TMTR | B'0 | R/W | <p>Transmit Request</p> <p>Setting this bit to 1 transmits the message stored in the transmit buffer.</p> <p>The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.</p> <ul style="list-style-type: none"> • Transmission has been completed. • Transmit abort has been completed after the TMTAR bit was set to 1. • An error or arbitration-lost has been detected with the TMOM bit set to 1. <p>Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is B'00.</p> <p>0: Transmission is not requested. 1: Transmission is requested.</p> |

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to H'00.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCK register ($p = m \times 16 + \text{the value of CFTML}[3:0] \text{ bits}$).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm ($m = 0 \text{ or } 1$) register ($p = (m \times 16 + 15) \text{ to } (m \times 16 + 15 - \text{the value of TXQDC}[3:0] \text{ bits})$).
- The TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode) and the RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the payload storage area ($p = (m \times 16) + 1, (m \times 16) + 2, (m \times 16) + 4, (m \times 16) + 5$).

Bits in the RSCFDnCFDTMCp register are all cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

48.9.10.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register (p = 0 to 31)

RSCFDnCFDTMIECyHH: <RSCFDn_base> + H'0393 + (H'04 × y)

Value after reset: H'0000_0000

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|---|
| 31 to 0 | TMIEp | H'0000_0000 | R/W | Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled. |

TMIEp Bits (p = 0 to 31)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue. When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (the transmit buffer merge mode is enabled), write 0 to bits corresponding to transmit buffers allocated to the payload storage area.

Table 48.23 shows the bit assignment.

| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R/W* | R/W* | R | R |

Note: * The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|------------|---------------|-----|---|
| 31 to 13 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 12 to 8 | THLMC[4:0] | B'0_0000 | R | Transmit History Buffer Unread Data Counter These bits indicate the number of unread data sets stored in the transmit history buffer. |
| 7 to 4 | Reserved | All 0 | R | When read, the value after reset is returned. When writing to these bits, write the value after reset. |
| 3 | THLIF | B'0 | R/W | Transmit History Interrupt Request Flag The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs. This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag. To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1". 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 2 | THLELT | B'0 | R/W | <p>Transmit History Buffer Overflow Flag</p> <p>The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.</p> <p>To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.</p> <p>When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".</p> <p>0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.</p> |
| 1 | THLFLL | B'0 | R | <p>Transmit History Buffer Full Status Flag</p> <p>The THLFLL flag is set to 1 when 16 data sets have been stored in the transmit history buffer, and is cleared to 0 when the number of data sets stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).</p> <p>0: Transmit history buffer is not full. 1: Transmit history buffer is full.</p> |
| 0 | THLEMP | B'1 | R | <p>Transmit History Buffer Empty Status Flag</p> <p>The THLEMP flag is cleared to 0 when even a single set of transmit history data has been stored in the transmit history buffer.</p> <p>This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).</p> <p>0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).</p> |

Note: To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write "0" to the given flag and "1" to other flags.

|---------|------------|---------------|-----|--|
| 31 to 0 | RDTA[31:0] | H'0000_0000 | R/W | RAM Data Test Access Data can be read and written in RSCAN RAM. |

Modify the RSCFDnCFDRPGACCr register in global test mode with the RTME bit in the RSCFDnCFDGTSTCTR register set to 1 (RAM test is enabled).

The RSCFDnCFDRPGACCr register is readable and writable when the RTME bit is set to 1.

48.10 Interrupt Sources and DMA Triggers

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

48.10.1 Interrupt Sources

Interrupt sources are classified into global and channel interrupts.

- Global interrupts (2 sources):
 - Receive FIFO interrupt
 - Global error interrupt
- Channel interrupts (3 sources/channel):
 - CANm transmit interrupt (m = 0 or 1)
 - CANm transmit complete interrupt
 - CANm transmit abort interrupt
 - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
 - CANm transmit history interrupt
 - CANm transmit queue interrupt
 - CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
 - CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In that case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 48.28 lists the CAN interrupt sources. Figure 48.2 shows the CAN global interrupt block diagram. Figure 48.3 shows the CAN channel interrupt block diagram.

Table 48.28 List of CAN Interrupt Sources

| | Interrupt Source | Corresponding Interrupt Request Flag | Corresponding Interrupt Enable Bit | |
|---------------------------------|-------------------------|--|---|---|
| Global interrupts | Receive FIFO | Receive FIFO 0 | RFIF in the RSCFDn(CFD)RFSTS0 register | RFIE in the RSCFDn(CFD)RFCC0 register |
| | | Receive FIFO 1 | RFIF in the RSCFDn(CFD)RFSTS1 register | RFIE in the RSCFDn(CFD)RFCC1 register |
| | | Receive FIFO 2 | RFIF in the RSCFDn(CFD)RFSTS2 register | RFIE in the RSCFDn(CFD)RFCC2 register |
| | | Receive FIFO 3 | RFIF in the RSCFDn(CFD)RFSTS3 register | RFIE in the RSCFDn(CFD)RFCC3 register |
| | | Receive FIFO 4 | RFIF in the RSCFDn(CFD)RFSTS4 register | RFIE in the RSCFDn(CFD)RFCC4 register |
| | | Receive FIFO 5 | RFIF in the RSCFDn(CFD)RFSTS5 register | RFIE in the RSCFDn(CFD)RFCC5 register |

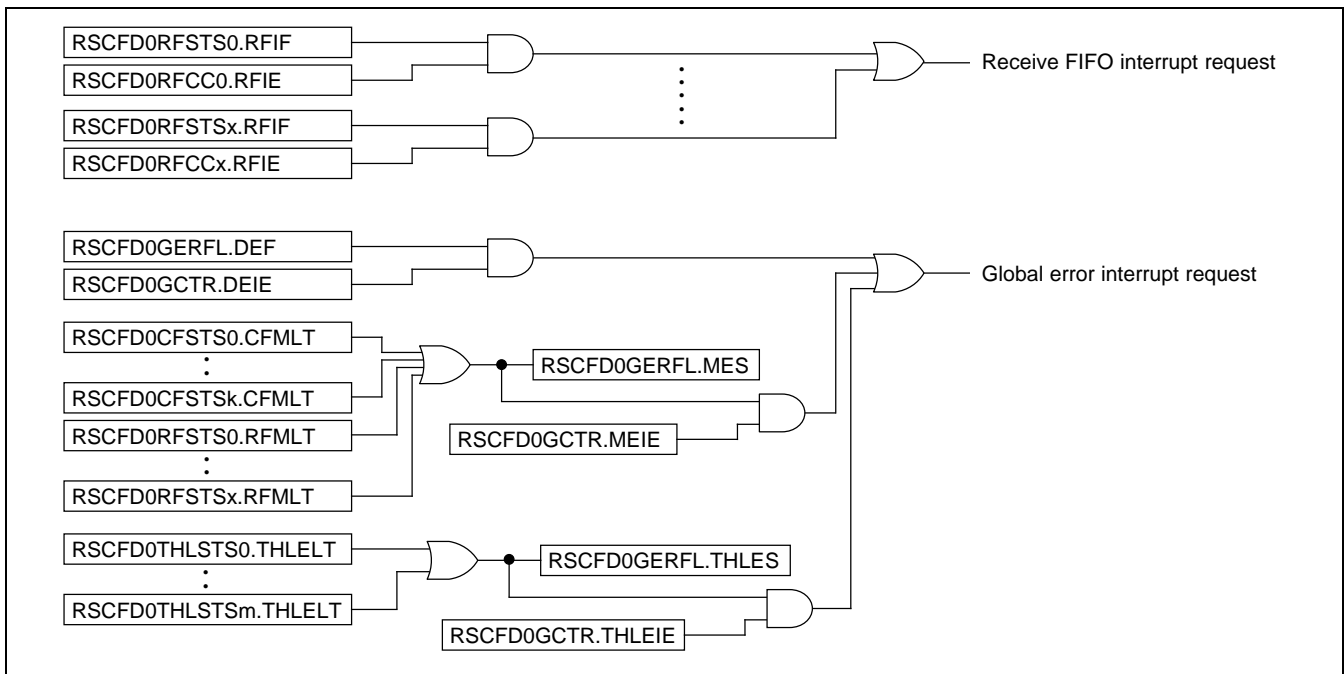

Figure 48.2 CAN Global Interrupt Block Diagram

Figure 48.3 CAN Channel Interrupt Block Diagram

48.10.2 DMA Triggers (CAN FD Mode Only)

In CAN FD mode, the FIFO buffer for reception can be related to DMA channels. The following 10 FIFO buffers are available.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k ($k = 3 \times m$, m = 0 or 1) assigned to channel m

When the DMA enable bit (the RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and there are unread messages in the related FIFO, a DMA transfer request trigger is generated.

48.11 CAN Modes

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in section 48.11.1, Global Modes, and details of channel modes are described in section 48.11.2, Channel Modes.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

48.11.1 Global Modes

Figure 48.4 shows the transitions of global modes.

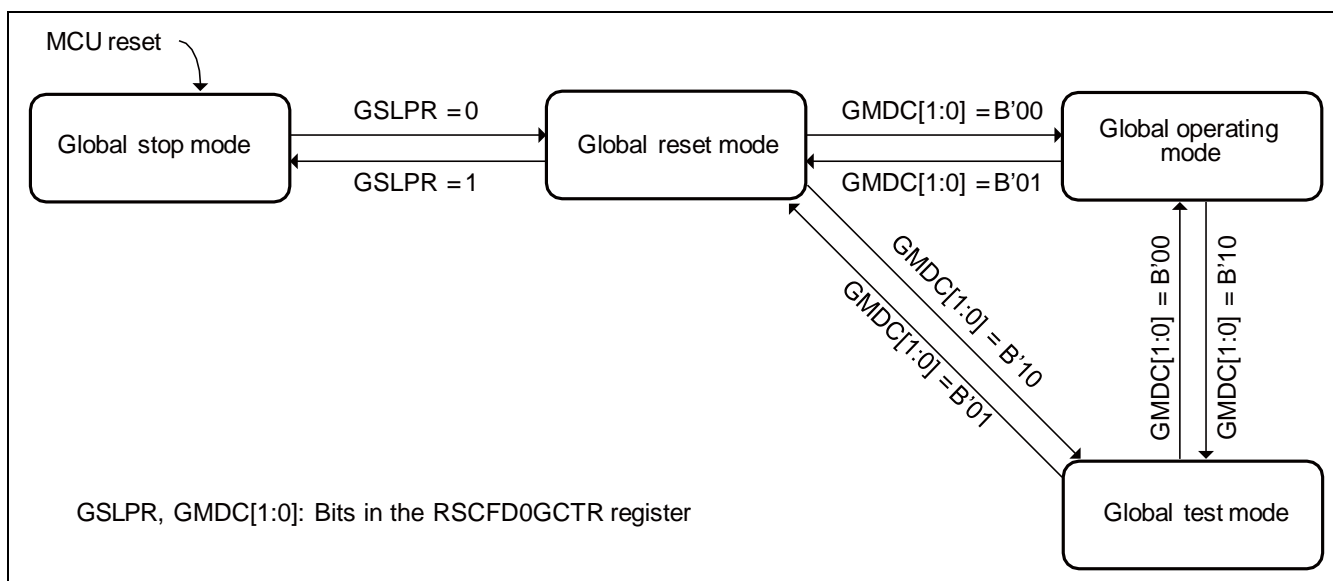

Figure 48.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. Table 48.29 shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 48.29 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

| Channel Mode before Setting | Channel Mode after Setting | | | |
|-----------------------------|---|--|---|--|
| | GMDC[1:0] = B'00 GSLPR = 0 (Global Operation) | GMDC[1:0] = B'10 GSLPR = 0 (Global Test) | GMDC[1:0] = B'01 GSLPR = 0 (Global Reset) | GMDC[1:0] = B'01 GSLPR = 1 (Global Stop) |
| Channel communication | Channel communication | Channel halt | Channel reset | Transition prohibited |
| Channel halt | Channel halt | Channel halt | Channel reset | Transition prohibited |
| Channel reset | Channel reset | Channel reset | Channel reset | Channel stop |
| Channel stop | Channel stop | Channel stop | Channel stop | Channel stop |

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 48.30 shows the global mode transition time.

Table 48.30 Global Mode Transition Time

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|------------------------|-----------------------|-----------------------------------|
| Global stop | Global reset | Three pclk cycles |
| Global reset | Global stop | Three pclk cycles |
| Global reset | Global test | Ten pclk cycles |
| Global reset | Global operating | Ten pclk cycles |
| Global test | Global reset | Two CAN bit times ^{*1,2} |
| Global test | Global operating | Three pclk cycles |
| Global operating | Global reset | Two CAN bit times ^{*1,2} |
| Global operating | Global test | Two CAN frames ^{*1} |

Notes: 1. It is the CAN bit time and CAN frame time with the lowest communication speed of the channels in use.
2. In CAN FD mode, it is the CAN bit time with normal bit rate.

48.11.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the RS-CANFD module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each of the RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the RS-CANFD module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

48.11.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. Table 48.33 and Table 48.34 list the registers to be initialized.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to B'01 sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR registers (m = 0 or 1) to B'01 (channel reset mode). If all channels are forced to transition to channel reset mode, the RS-CANFD module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to B'01).

48.11.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to B'10 sets the CHMDC[1:0] bits in each of the RSCFDn(CFD)CmCTR register to B'10 (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

48.11.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to B'00, the RS-CAN module transitions to global operating mode.

48.11.2 Channel Modes

Figure 48.5 shows a channel mode state transition chart. Table 48.31 shows the channel mode transition time.

Figure 48.5 Channel Mode State Transition Chart

Table 48.31 Channel Mode Transition Time

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|------------------------|-----------------------|-------------------------|
| Channel stop | Channel reset | Three pclk cycles |
| Channel reset | Channel stop | Three pclk cycles |
| Channel reset | Channel halt | Three CANm bit times* |
| Channel reset | Channel communication | Three CANm bit times* |

| Mode before Transition | Mode after Transition | Maximum Transition Time |
|------------------------|-----------------------|-------------------------|
| Channel halt | Channel reset | Two CANm bit times* |
| Channel halt | Channel communication | Four CANm bit times* |
| Channel communication | Channel reset | Two CANm bit times* |
| Channel communication | Channel halt | Two CANm frames |

Note: * In CAN FD mode, it is the CANm bit time with normal bit rate.

48.11.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0 or 1) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

48.11.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. Table 48.33 lists the registers to be initialized.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to B'01 (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. Table 48.32 shows the operation when the CHMDC[1:0] bits are set to B'01 (channel reset mode) during CAN communication.

48.11.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 48.32 shows operation when the CHMDC[1:0] bits are set to B'10 (channel halt mode) during CAN communication.

Table 48.32 Operation a Channel Transitions to Channel Reset Mode/Channel Halt Mode

| Mode | During Reception | During Transmission | Bus Off State |
|---|--|---|---|
| Channel reset (CHMDC[1:0] = B'01) | Transitions to channel reset mode before reception is completed.* ¹ | Transitions to channel reset mode before transmission is completed.* ¹ | Transitions to channel reset mode before bus off recovery. |
| Channel halt* ³ (CHMDC[1:0] = B'10) | Transitions to channel halt mode after reception is completed.* ² | Transitions to channel halt mode after transmission is completed. | [When BOM[1:0] = B'00] Transitions to channel halt mode (CHMDC[1:0] = B'10) only after bus off recovery. [When BOM[1:0] = B'01] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = B'10] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = B'11] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to B'10 before bus off recovery. |

- Notes: 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to B'10 and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to B'01.
2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when dominant lock is detected.
3. When the transition from channel reset mode to channel halt mode is to be made, in classical CAN mode, set the RSCFDn(CFD)CmCFG register in channel reset mode and then shift to channel halt mode. In CAN FD mode, make transition to channel halt mode after setting the RSCFDn(CFD)CmNCFG and RSCFDn(CFD)CmDCFG registers.

48.11.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to B'00, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0 or 1) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

48.11.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = B'00:

Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmERFL register are initialized to H'00, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to B'10 (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).

- When BOM[1:0] = B'01:

When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to B'10 and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H'00. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.

- When BOM[1:0] = B'10:

When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to B'10. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H'00, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.

- When BOM[1:0] = B'11:

When the CHMDC[1:0] bits are set to B'10 in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to H'00, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.

However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 128 times of 11 consecutive recessive bits) before CHMDC[1:0] bits are set to B'10.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to B'01 or B'10 is made only when the CHMDC[1:0] bits are B'00 (channel communication mode).

Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to H'00. Write 1 to the RTBO bit only when the BOM[1:0] value is B'00. Writing the RTBO bit to 1 in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

48.11.3 Registers Initialized by Transition to CAN Mode

Table 48.33 shows bits and flags initialized by transition to channel reset mode. These bits and flags are also initialized by transition to global reset mode. Table 48.34 shows bits and flags that are only initialized by transition to global reset mode.

Table 48.33 Registers Initialized in Global Reset Mode or Channel Reset Mode

| Register | Bit / Flag |
|-------------------------------|---|
| RSCFDn(CFD)CmCTR register | (ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0] |
| RSCFDn(CFD)CmSTS register | CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0] |
| RSCFDn(CFD)CmERFL register | CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF |
| RSCFDnCFDCmFDCTR register | EOCCLR, SOCCLR |
| RSCFDnCFDCmFDSTS register | SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0] |
| RSCFDnCFDCmFDCRC register | CRCREG[20:0] |
| RSCFDn(CFD)CFCK register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF |
| RSCFDn(CFD)CFTISTS register | CFkTXIF |
| RSCFDn(CFD)TMCp register | TMOM, TMTAR, TMTR |
| RSCFDn(CFD)TMSTSp register | TMTARM, TMTRM, TMTRF[1:0], TMTSTS |
| RSCFDn(CFD)TMTRSTSy register | TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTARSTSy register | TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTCSTSy register | TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TMTASTSy register | TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.) |
| RSCFDn(CFD)TXQCCm register | TXQE |
| RSCFDn(CFD)TXQSTSm register | TXQIF, TXQFLL, TXQEMP |
| RSCFDn(CFD)THLCCm register | THLE |
| RSCFDn(CFD)THLSTSm register | THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP |
| RSCFDn(CFD)GTINTSTS0 register | TSIFm, TAIEm, TQIFm, CFTIFm, THIFm (m = 0 or 1) |
| RSCFDn(CFD)GTINTSTS1 register | TSIFm, TAIEm, TQIFm, CFTIFm, THIFm (m = 4 or 5) |

Note: Bits and flags enclosed by () only exist in registers for CAN FD mode.

Table 48.34 Registers Initialized Only in Global Reset Mode

| Register | Bit / Flag |
|-----------------------------|--|
| RSCFDn(CFD)GSTS register | GHLTSTS |
| RSCFDn(CFD)GERFL register | EEF0, EEF1, EEF2, EEF3, EEF4, EEF5, (CMPOF), THLES, MES, DEF |
| RSCFDn(CFD)GTSC register | TS[15:0] |
| RSCFDn(CFD)RMNDy register | RMNSq |
| RSCFDn(CFD)RFCCx register | RFE |
| RSCFDn(CFD)RFSTsx register | RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP |
| RSCFDn(CFD)CFCCk register | When transmit/receive FIFO buffer is in receive mode: CFE |
| RSCFDn(CFD)CFSTSk register | When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT |
| RSCFDn(CFD)FESTS register | CFkEMP, RFxEMP |
| RSCFDn(CFD)FFSTS register | CFkFLL, RFxFLL |
| RSCFDn(CFD)FMSTS register | CFkMLT, RFxMLT |
| RSCFDn(CFD)RFISTS register | RFxIF |
| RSCFDn(CFD)CFRISTS register | CFkRXIF |
| RSCFDnCFDCDTCT register | CFDMAEm, RFDMAEx |
| RSCFDnCFDCDTSTS register | CFDMASTSm, RFDMASTsx |
| RSCFDn(CFD)GTSTCFG register | RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE, C3ICBCE, C4ICBCE, C5ICBCE |
| RSCFDn(CFD)GTSTCTR register | RTME, ICBCTME |

Note: Bits and flags enclosed by () only exist in registers for CAN FD mode.

48.12 Reception Function

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

There are two reception types.

Reception by receive buffers:

- 0 to 31 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

48.12.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 128 receive rules can be registered in this module that has two channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. Figure 48.6 illustrates how receive rules are registered.

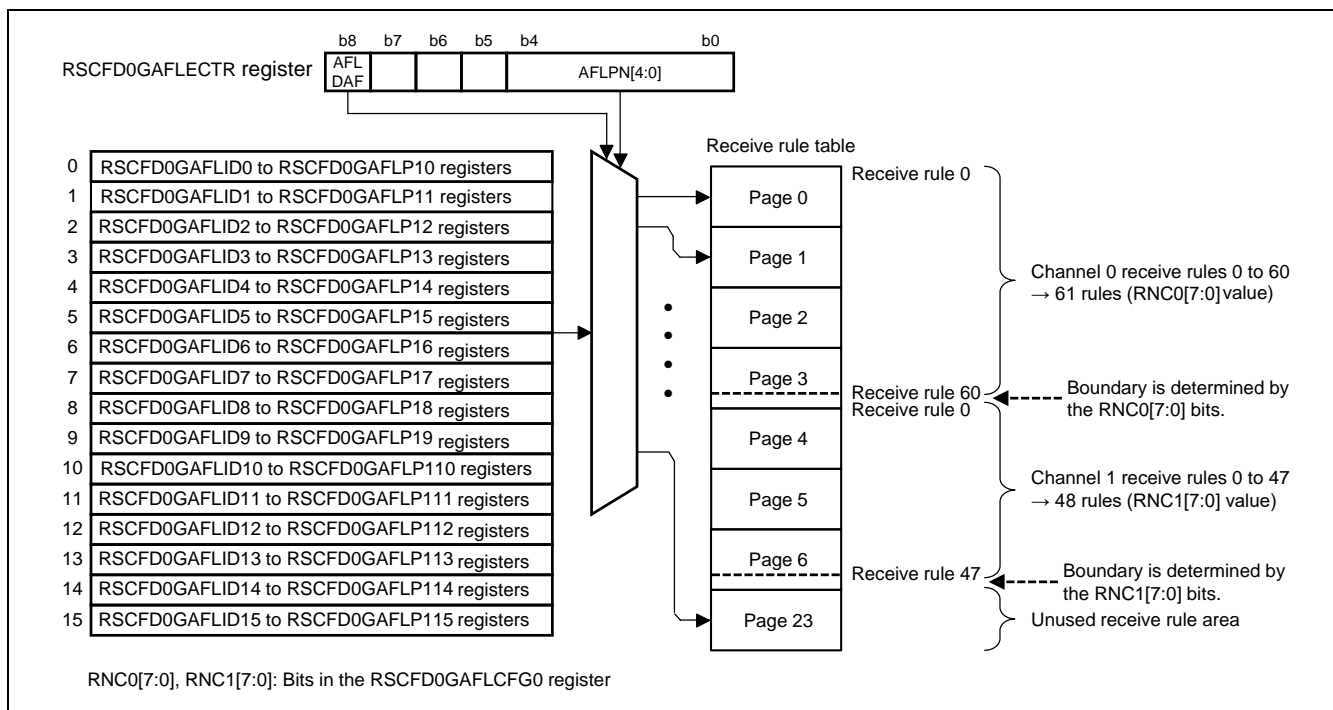

Figure 48.6 Entry of Receive Rules (for Setting Channels 0 and 1)

Note: Receive rules for each channel must be set in contiguous blocks. Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

48.12.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule of the minimum number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

Figure 48.7 Acceptance Filter Function

48.12.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is added to messages that passed through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of H'00 is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

48.12.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CAN FD mode, when the payload length of the received message exceeds the size for storing the payload in the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, a message which exceeds the size for storing the payload is not stored in the buffer. When the CMPOC bit is 1, the payload which exceeds the storage size is truncated and a message is stored in the buffer.

48.12.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

48.12.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is made available by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

48.12.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording the time for receiving and transmitting messages. The timestamp counter value is fetched at the start-of-frame (SOF) timing of a message and stored in a receive buffer or a FIFO buffer with a message ID and data at reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCAN0GCFG register; it is selected by pclk/2 or the CANm bit time clock (m = 0 or 1) in classical CAN mode and pclk/2 or the CANm normal bit time clock in CAN FD mode. However, do not select the CANm normal bit time clock of a channel which handles the CAN FD frame. The count source of the timestamp counter is obtained by a clock which divides the selected clock source by the TSP[3:0] bits in the RSCAN0GCFG register.

When the CANm bit time clock or CANm normal bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to H'0000 by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.

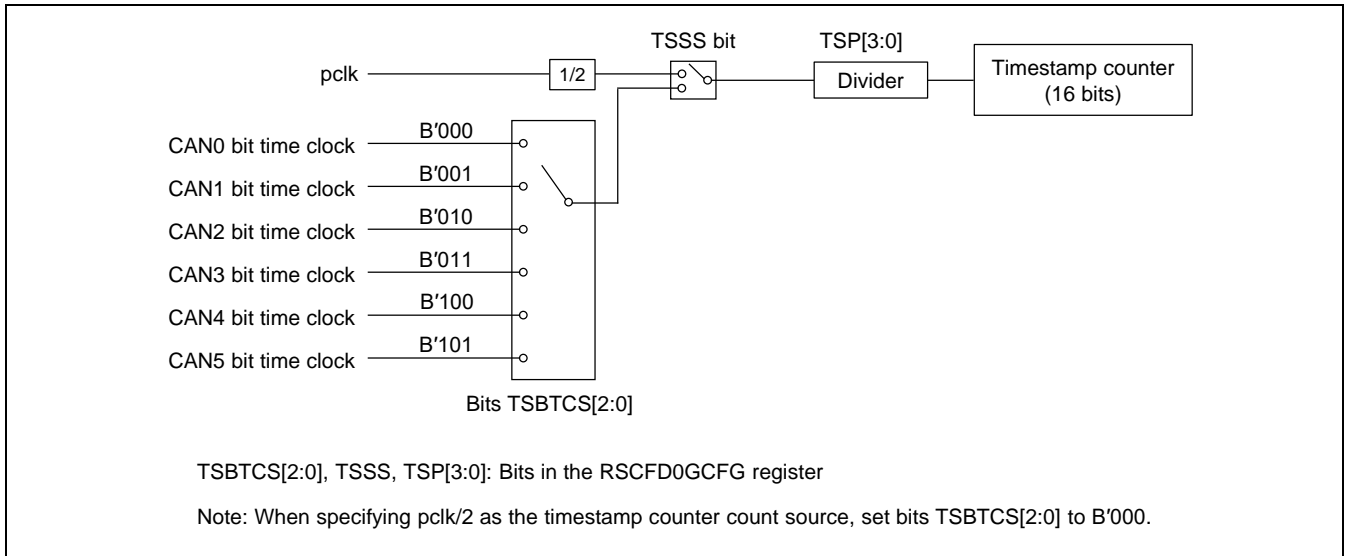

Figure 48.8 Timestamp Function Block Diagram

48.13 Transmission Function

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

There are three types of transmission. In classical CAN mode, the 8-byte payload length can be transmitted in each type of transmission. In CAN FD mode, the payload length to be transmitted differs depending on the type of transmission.

- Transmission using transmit buffers:**
 Each channel has 16 buffers. In CAN FD mode, the 20-byte payload length can be transmitted. However, when transmit buffer merge mode is used, four of 16 buffers are allocated as storage areas for the payload and two buffers can be used to transmit the payload which exceeds 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):**
 Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. In CAN FD mode, the 64-byte payload length can be transmitted. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:**
 Up to 16 transmit buffers per channel can be allocated to the transmit queues. In CAN FD mode, the 20-byte payload length can be transmitted. Transmit buffer $((16 \times m) + 15)$ is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 48.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

| Transmit buffer 4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 5 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 6 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 7 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 8 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 9 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 10 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 11 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 12 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 13 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 14 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit/receive FIFO buffer 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit/receive FIFO buffer 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 4 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit/receive FIFO buffer 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 6 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 7 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 8 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 9 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 10 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit/receive FIFO buffer 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 1 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 2 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit buffer 3 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Transmit queue | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

Figure 48.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

48.13.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

The priority is determined by using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination.

When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence. When the TPRI bit is set to 1, the message in the transmit buffer with the minimum buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit. If the ECC2 bit error is detected in priority determination, transmission will not be performed (only when the EEFE bit in the RSCFDnGCFG register is 1 in classical CAN mode).

48.13.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 31). When transmit completes successfully, the TMTRF[1:0] flag is set to B'10 (transmission has been completed (without transmit abort request)) or B'11 (transmission has been completed (with transmit abort request)).

48.13.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to B'01 (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

48.13.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to B'10 or B'11. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to B'01 (transmit abort has been completed).

48.13.2.3 Transmit Buffer Merge Mode (CAN FD Mode Only)

Although the 20-byte payload length can be transmitted from the transmit buffer, it is possible to transmit messages having a maximum of 64-byte payload length after merging three transmit buffers in transmit buffer merge mode.

When the TMME bit in the RSCFDnCFDCmFDCFG register is set to 1, transmit buffer merge mode is enabled. In this mode, six buffers are used as merge areas in each channel and two transmit buffers $((16 \times m) + 0$ to $(16 \times m) + 2$ and $(16 \times m) + 3$ to $(16 \times m) + 5$) are merged. Transmission is requested in the first transmit buffer and the following two buffers are used as the payload storage area. For other transmit buffers than the first buffer, do not set 1 to the transmission request bit (the TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (the TMTAR bit in the RSCFDnCFDTMCp register).

While transmit buffer merge mode is being enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate the buffer to the transmit queue.

48.13.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffers, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register ($k = 0$ to 5). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

48.13.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to H'00.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to B'00, the count source is obtained by dividing $plk/2$ by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to B'10, the count source is obtained by dividing $plk/2$ by (the value of

the ITRCP[15:0] bits in the RSCFDn(CFD)GCFG register $\times 10$). When the CFITR and CFITSS bits are set to B'x1, the CANm bit time clock and the CANm normal bit time clock are used as a count source in classical CAN mode and CAN FD mode, respectively.

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = B'00:

$$\frac{1}{\text{Frequency of pclk}} \times 2 \times M \times N$$

- When CFITR and CFITSS = B'10:

$$\frac{1}{\text{Frequency of pclk}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = B'x1:

$$\text{Classical CAN mode} \quad : \quad \frac{1}{\text{Frequency of CANm bit time clock}} \times N$$

$$\text{CAN FD mode} \quad : \quad \frac{1}{\text{Frequency of CANm normal bit time clock}} \times N$$

Figure 48.10 shows the interval timer block diagram.

Figure 48.10 Interval Timer Block Diagram

Figure 48.11 shows the interval timer timing diagram.

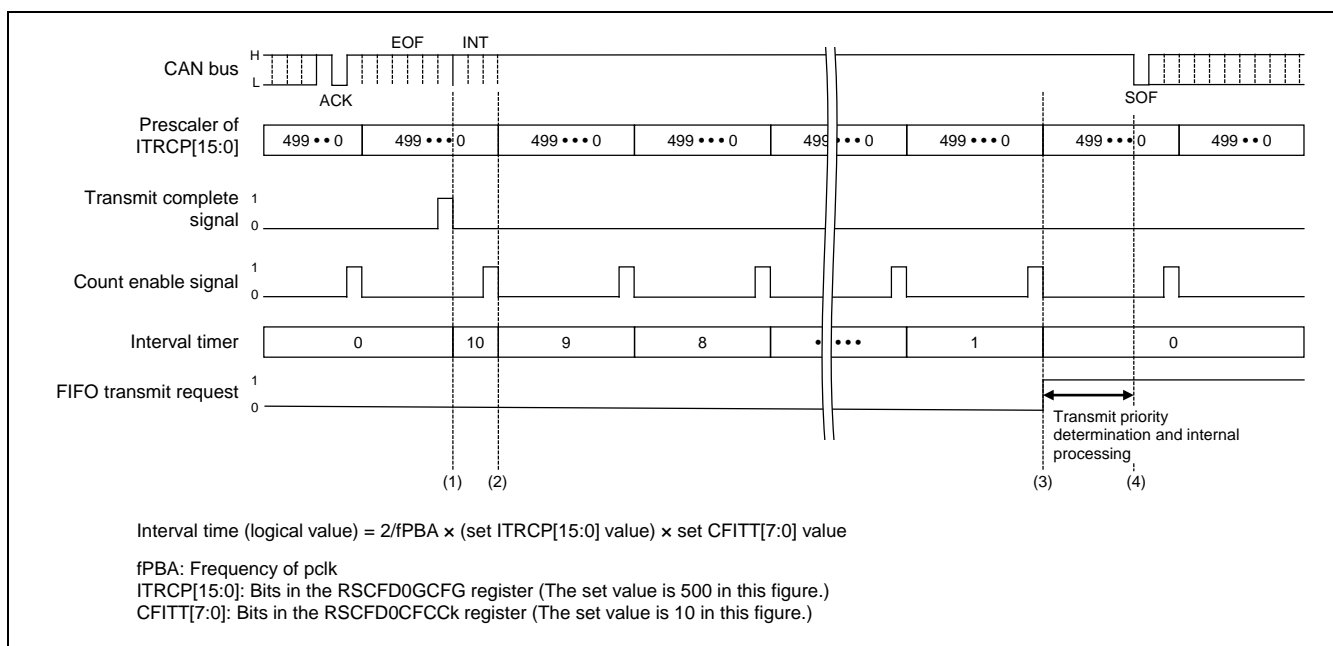

Figure 48.11 Interval Timer Timing Chart

- (1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.
- (2) The interval timer is decremented by the next count enable signal.
- (3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.
- (4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 1164 cycles of the pclk may be generated.

48.13.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to ten buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and a transmit buffer $((16 \times m) + 15)$ is used as an access window of a corresponding channel. All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue. Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

48.13.5 Padding Transmit Data (CAN FD Mode Only)

If the payload length indicated by the DLC value of the specified transmission message exceeds the size of the payload storage area of the transmit buffer, the exceeded payload will be padded by H'CC.

The processing is performed at the following cases when transmit merge mode is not enabled (the TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO which has been set for transmit or gateway mode:
The payload length of the transmission DLC exceeds the size of the payload storage area of the transmit/receive FIFO buffer which has been set for the CFPLS[2:0] bits in the RSCFDnCFDCFCCK register.
- Transmit buffer (including transmit queues):
The payload length of the transmit DLC exceeds 20 bytes.

When transmit buffer merge mode is enabled, the transmit data is not padded even if transmission is performed by using transmit buffers, transmit/receive buffers, or transmit queues. In this case, do not set the payload length, which exceeds the size of the payload storage area of the transmit buffer, to the DLC value of the transmission message.

48.13.6 Transmit History Function

Information on the transmitted messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

Types of message transmit source buffers can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register ($k = 0$ to 5) determines whether or not the transmit history data is stored for each message.

In classical CAN mode, the TMTSCE bit in the RSCFDnGCFG register determines whether or not a timestamp value is included in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmission history buffer after transmission has successfully completed.

Storage of the transmission history data after successful completion of transmission may take up to 152 clock cycles of pclk.

- **Buffer type** B'001: Transmit buffer
B'010: Transmit/receive FIFO buffer
B'100: Transmit queue
- **Buffer number** Number of a transmit buffer, a transmit queue, or a transmit/receive FIFO buffer in the transmit source. This number depends on the buffer types. See Table 48.35.
- **Label data** Label information of the transmit message
- **Timestamp** Timestamp value of the transmit message
(In classical CAN mode, the TMTSCE bit is 1.)

Table 48.35 Transmit History Data Buffer Numbers

| Buffer No. | Buffer type | | |
|------------|------------------------------------|---|---|
| | B'001 | B'010 | B'100 |
| B'0000 | Transmit buffer $16 \times m + 0$ | Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 5) | Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission |
| B'0001 | Transmit buffer $16 \times m + 1$ | | |
| B'0010 | Transmit buffer $16 \times m + 2$ | | |
| B'0011 | Transmit buffer $16 \times m + 3$ | | |
| B'0100 | Transmit buffer $16 \times m + 4$ | | |
| B'0101 | Transmit buffer $16 \times m + 5$ | | |
| B'0110 | Transmit buffer $16 \times m + 6$ | | |
| B'0111 | Transmit buffer $16 \times m + 7$ | | |
| B'1000 | Transmit buffer $16 \times m + 8$ | | |
| B'1001 | Transmit buffer $16 \times m + 9$ | | |
| B'1010 | Transmit buffer $16 \times m + 10$ | | |
| B'1011 | Transmit buffer $16 \times m + 11$ | | |
| B'1100 | Transmit buffer $16 \times m + 12$ | | |
| B'1101 | Transmit buffer $16 \times m + 13$ | | |
| B'1110 | Transmit buffer $16 \times m + 14$ | | |
| B'1111 | Transmit buffer $16 \times m + 15$ | | |

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, a transmit queue, or a transmit/receive FIFO buffer.

A timestamp value is obtained from the timestamp counter at the timing of the start-of-frame (SOF) of a message. For details on the timestamp counter, refer to section 48.12.1.6, Timestamp.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

48.14 Gateway Function

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM [1:0] bits in the RSCFDn(CFD)CFCCk register are set to B'10 (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the reception rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

48.14.1 CAN-CAN FD Gateway (CAN FD Mode Only)

When the gateway function is used in CAN FD mode, the transmit frame can be replaced with the classical CAN frame or CAN FD frame.

When the GWEN bit in the RSCFDnCFDCmFDCFG register is set to 1, the CAN-CAN FD gateway is enabled. The GWDF and GWBRS bits in the RSCFDnCFDCmFDCFG register can be used to select the FDF and BRS bits of the transmit frame. When the DLC value of the received classical CAN frame is equal to or larger than B'1001 and the GWDF bit is 1 (CAN FD frame), the DLC value is replaced with B'1000.

When the CAN-CAN FD gateway is enabled, do not route the following frames.

- CAN FD frame of which payload length is longer than 8 bytes
- Remote frame

48.15 Test Function

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

Test functions are classified into communication tests and global tests.

- Communication tests: Performed for each channel.
 - Standard test mode
 - Listen-only mode
 - Self-test mode 0 (external loopback mode)
 - Self-test mode 1 (internal loopback mode)
 - Limited operation mode (CAN FD mode only)
- Global tests: Performed for the entire module
 - RAM test (read/write test)
 - Inter-channel communication test [CRC error test is enabled.]

48.15.1 Standard Test Mode

Standard test mode allows CRC test. The CRC value, which has been calculated by the RS-CANFD module according to the transmit or receive message, is stored in the register; the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is in the classical CAN frame (15-bit CRC length) and the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is in the CAN FD frame (17-bit or 21-bit CRC length). Use the inter-channel communication test function for the CRC error test. For details, refer to section 48.15.6.1, CRC Error Test.

48.15.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted. Listen-only mode is available for detecting the communication speed. Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 48.12 shows the connection when listen-only mode is selected.

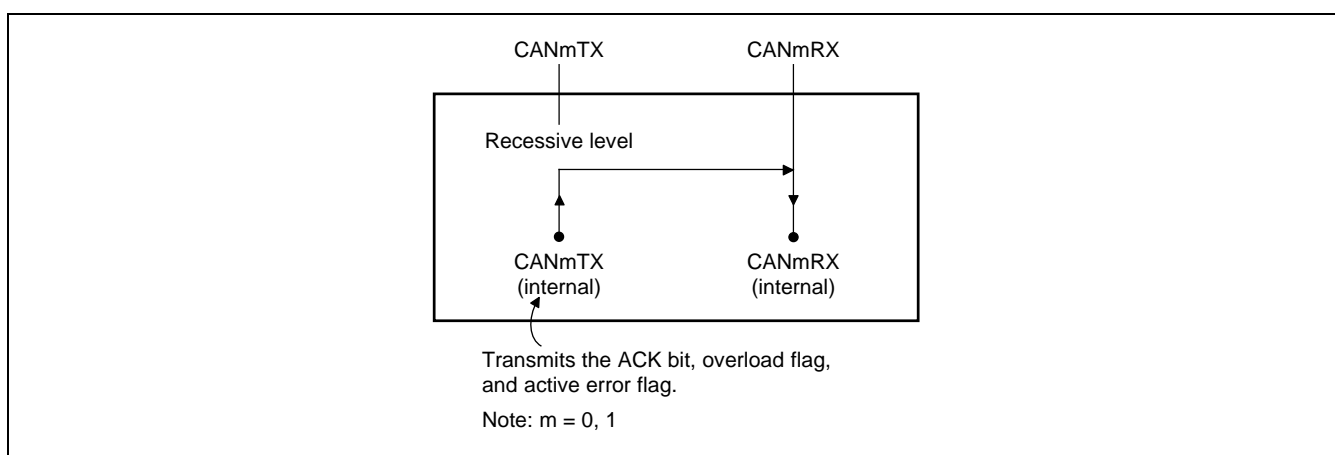

Figure 48.12 Connection when Listen-Only Mode is Selected

48.15.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register ($j = 0$ to 15) is set to 0 (when a message transmitted from another CAN node is received).

If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

48.15.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 48.13 shows the connection when self-test mode 0 is selected.

Figure 48.13 Connection when Self-Test Mode 0 is Selected

48.15.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin ($m = 0$ or 1) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 48.14 shows the connection when self-test mode 1 is selected.

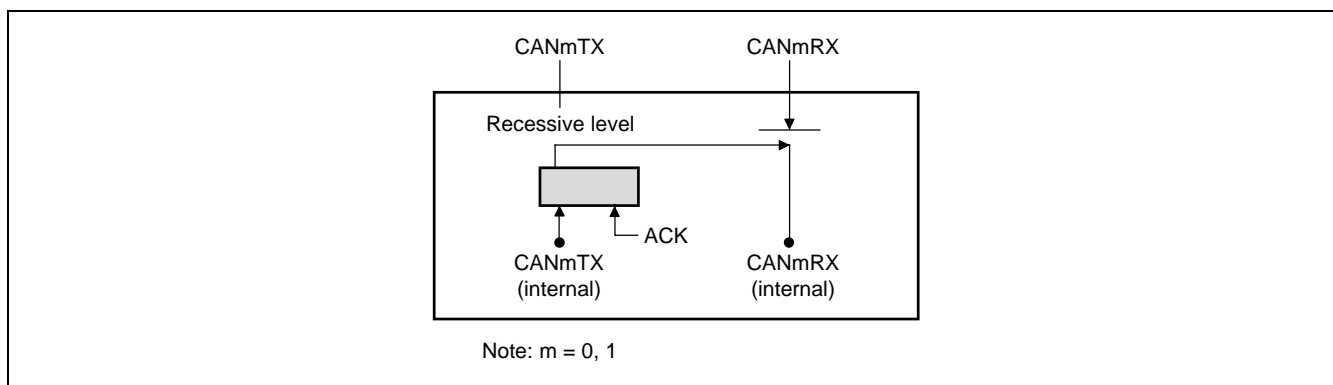

Figure 48.14 Connection when Self-Test Mode 1 is Selected

48.15.4 Limited Operation Mode (CAN FD Mode Only)

When the enabled data and remote frames are received in limited operation mode, an ACK bit is generated. However, these frames are not transmitted even if the error frame or overload frame transmit condition is detected. When the condition is detected, CANFD waits for the bus idling state to resynchronize CAN communications. The receive error counter (REC) and the transmit error counter (TEC) are not changed if an error occurs.

For transmission, any transmit request can be issued with no limitations.

48.15.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test page is set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 15360 bytes (H'3C00) in classical CAN mode and 21312 bytes (H'53D0) in CAN FD mode.

48.15.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel.

Figure 48.15 shows the connection for inter-channel communication test.

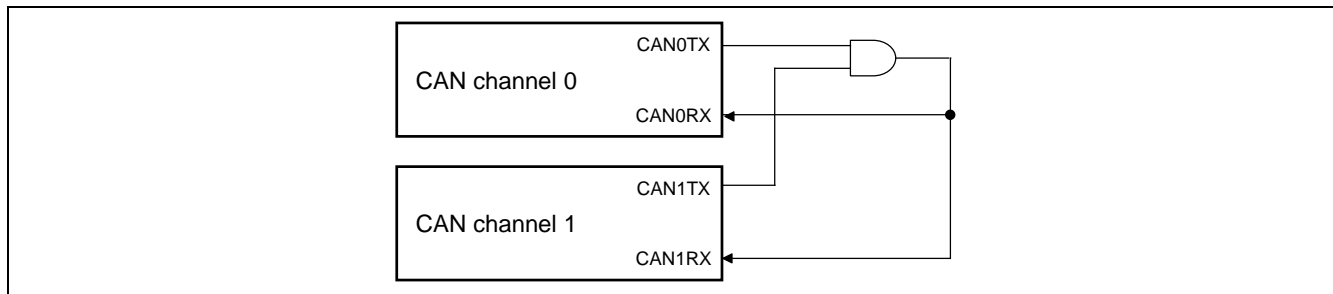

Figure 48.15 Connection for Inter-Channel Communication Test

48.15.6.1 CRC Error Test

During inter-channel communication test, a CRC error test can be performed. The following shows an example of procedure when a CRC error test on channel 0 is performed during communication test between channels 0 and 1.

Conditions:

- Inter-channel communication test is enabled.
- Channels 0 and 1 are in standard test mode.

Procedure:

1. Make a setting that a message is transmitted from transmit buffer p in channel 1.
2. Set 1 to the CRCT bit in the RSCFDn(CFD)C0CTR register (inversion of the start bit in the receive ID field is enabled).
3. Set 1 to the TMTR bit in the RSCFDn(CFD)TMCp register (a transmission request is issued to transmit buffer p in channel 1).
4. Wait for generation of the CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[15:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register on both channels and check that the CRC values are different in the transmit and receive sides.
6. Check that the CERR bit in the RSCFDm(CFD)C0ERFL register is 1 (a CRC error is detected).

Using the CRC error test function generates an illegal CRC value by inverting the start bit in the receive ID field. Therefore, if the higher-order five bits of the ID are B'1_0000 or the higher-order six bits are B'01_1111 in the received message, note that a stuff error (consecutive 6-bit data with the same level) will be detected.

Since the CRC generation circuit in the RS-CANFD module is incorporated in each protocol controller of channels and the same circuit is shared in transmission and reception, a CRC calculation test needs not be performed at transmission.

48.16 RS-CANFD Setting Procedure

RZ/G2H

RZ/G2M V1.3

RZ/G2M V3.0

48.16.1 Initial Settings

RZ/G2N

RZ/G2E

The RS-CAN module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 7586 cycles of the pclk. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. Figure 48.16 shows the CAN setting procedure after the MCU is reset.

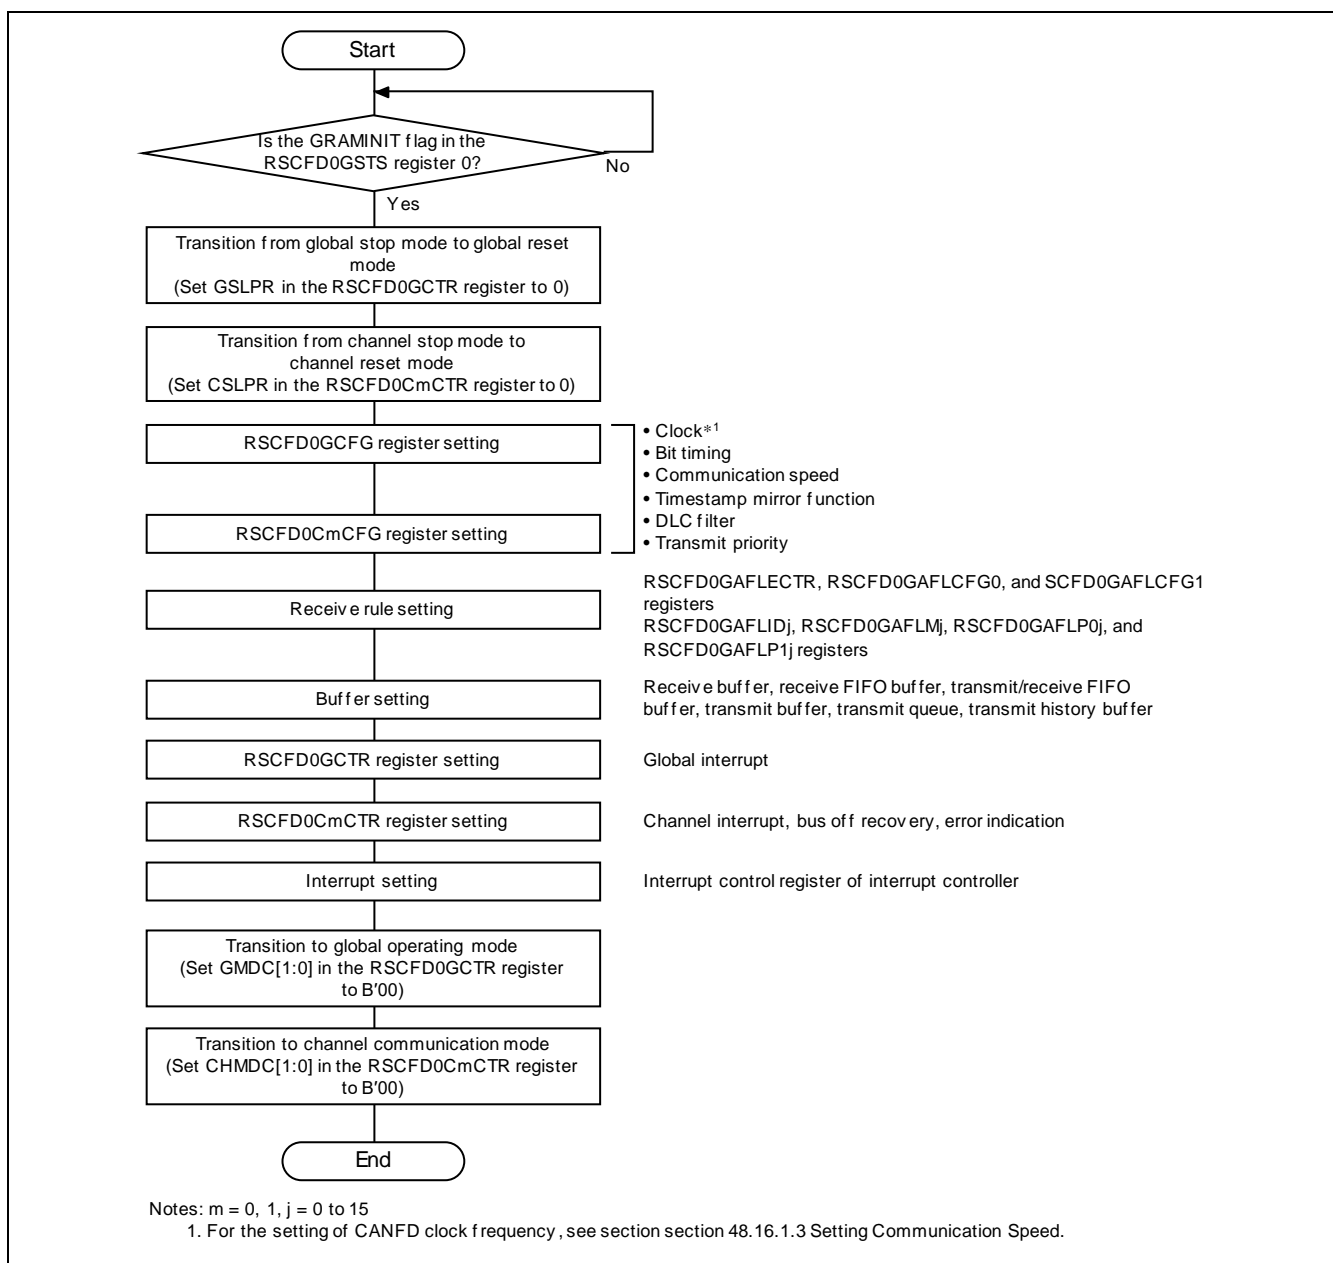

Figure 48.16 CAN Setting Procedure after the MCU is Reset

48.16.1.1 Setting a Clock

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clk_c using the DCS bit in the RSCFDn(CFD)GCFG register.

48.16.1.2 Setting Bit Timing

In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the register for each channel. These segments are set by the RSCFDnCmCFG register in classical CAN mode. In CAN FD mode, these segments have two types of bit rates (normal and data bit rates) and each bit rate is set by the RSCFDnCFDCmNCFG and RSCFDnCFDCmDCFG registers. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). 1 Tq is equal to one CANmTq clock cycle. A 1Tq is a clock cycle which divides the clock selected with the DCS bit in the RSCFDnGCFG register. The division ratio is set by the BRP[9:0] bits in the RSCFDnCmCFG register (CANmTq clock cycle) in classical CAN mode and set by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register (CANmTq(N) and CANmTq(D) clock cycles) in CAN FD mode. ISO 11898-1 allows the normal and data bit rates individually have each division ratio. However, if different values are set to each division ratio, resynchronization between CAN nodes may be lost at the timing when the normal bit rate is switched to the data bit rate. Therefore, it is recommended that the NBRP[9:0] and DBRP[7:0] bits are set to the same value and two bit rates are set to the different values depending on the segment value.

Figure 48.17 shows the bit timing chart. Table 48.36 shows an example of bit timing setting.

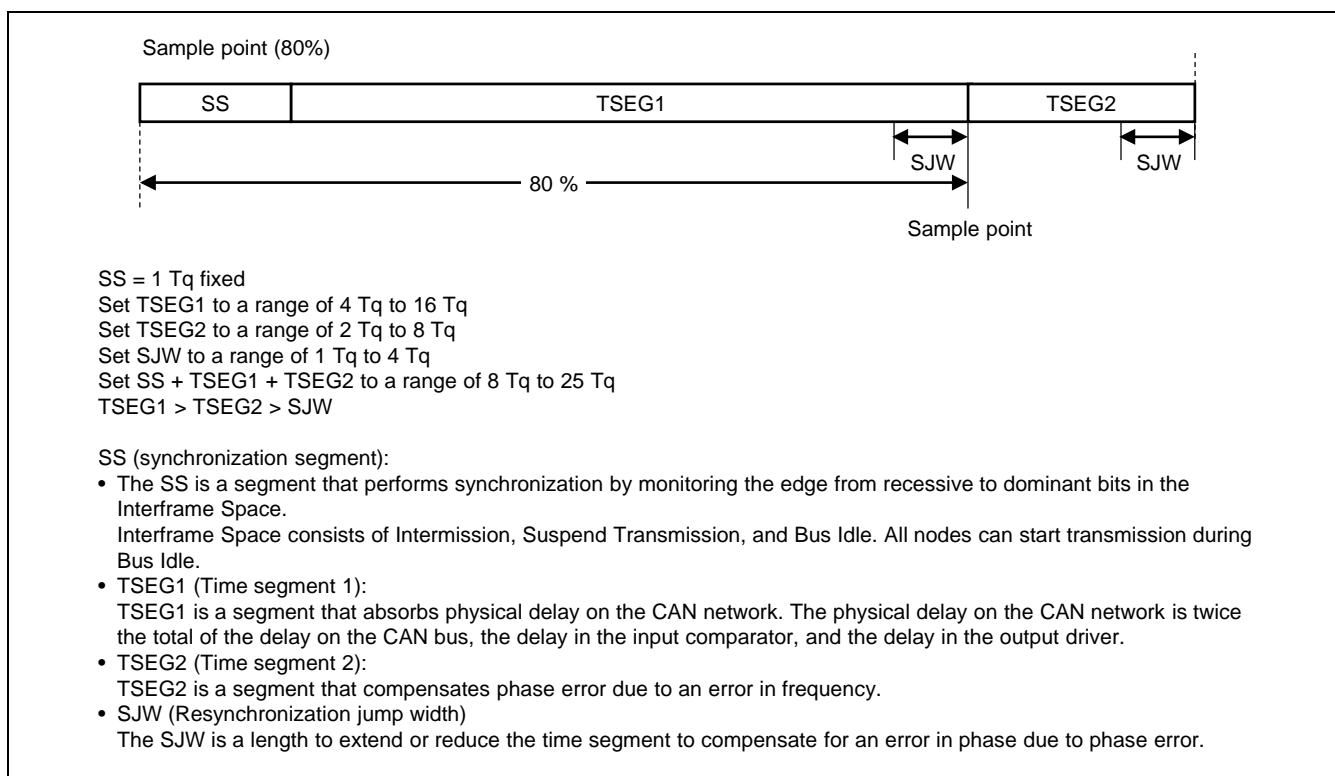

Figure 48.17 Bit Timing Chart

Table 48.36 Example of Bit Timing Setting

| 1 Bit | Set Value (Tq) | | | | Sample Point (%) |
|--------|----------------|-------|-------|-----|-------------------------|
| | SS | TSEG1 | TSEG2 | SJW | Note: See Figure 48.17. |
| 5 Tq* | 1 | 2 | 2 | 1 | 60.00 |
| 8 Tq | 1 | 4 | 3 | 1 | 62.50 |
| | 1 | 5 | 2 | 1 | 75.00 |
| 10 Tq | 1 | 6 | 3 | 1 | 70.00 |
| | 1 | 7 | 2 | 1 | 80.00 |
| 16 Tq | 1 | 10 | 5 | 1 | 68.75 |
| | 1 | 11 | 4 | 1 | 75.00 |
| 20 Tq | 1 | 12 | 7 | 1 | 65.00 |
| | 1 | 13 | 6 | 1 | 70.00 |
| 50 Tq* | 1 | 39 | 10 | 4 | 80.00 |

Note: * CAN FD mode only.

48.16.1.3 Setting Communication Speed

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. In CAN FD mode, set communication speed for each channel in arbitration and data phases.

Figure 48.18 shows the CAN clock control block diagram, and Table 48.37 shows an example of the communication speed setting.

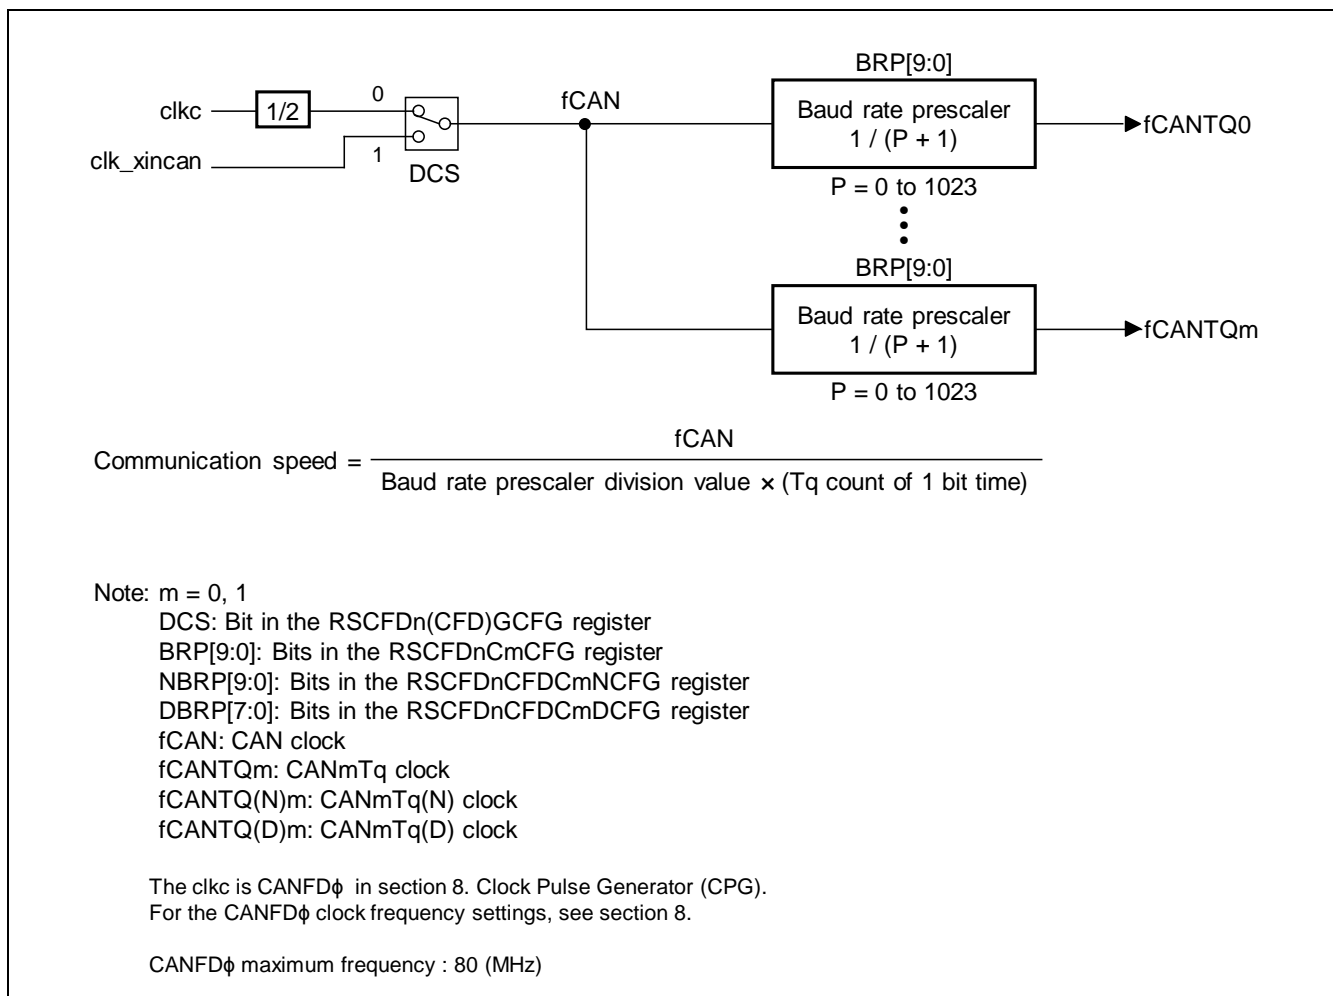

Figure 48.18 CAN Clock Control Block Diagram

Table 48.37 Example of Communication Speed Setting (Classical CAN Mode)

| Communication speed | fCAN | | | | | |
|---------------------|------------|------------|------------|------------|-----------|-----------|
| | 40 MHz | 32 MHz | 24 MHz | 20 MHz | 16 MHz | 8 MHz |
| 1 Mbps | 8 Tq (5) | 8 Tq (4) | 8 Tq (3) | 10 Tq (2) | 8 Tq (2) | 8 Tq (1) |
| | 20 Tq (2) | 16 Tq (2) | 12 Tq (2) | 20 Tq (1) | 16 Tq (1) | |
| | | | 24 Tq (1) | | | |
| 500 Kbps | 8 Tq (10) | 8 Tq (8) | 8 Tq (6) | 10 Tq (4) | 8 Tq (4) | 8 Tq (2) |
| | 20 Tq (4) | 16 Tq (4) | 12 Tq (4) | 20 Tq (2) | 16 Tq (2) | 16 Tq (1) |
| | | | 24 Tq (2) | | | |
| 250 Kbps | 8 Tq (20) | 8 Tq (16) | 8 Tq (12) | 10 Tq (8) | 8 Tq (8) | 8 Tq (4) |
| | 20 Tq (8) | 16 Tq (8) | 12 Tq (8) | 20 Tq (4) | 16 Tq (4) | 16 Tq (2) |
| | | | 24 Tq (4) | | | |
| 125 Kbps | 8 Tq (40) | 8 Tq (32) | 8 Tq (24) | 10 Tq (16) | 8 Tq (16) | 8 Tq (8) |
| | 20 Tq (16) | 16 Tq (16) | 12 Tq (16) | 20 Tq (8) | 16 Tq (8) | 16 Tq (4) |
| | | | 24 Tq (8) | | | |

Table 48.38 Example of Communication Speed Setting (CAN FD Mode, Normal Bit Rate and Data Bit Rate)

| Communication speed | fCAN | |
|-----------------------|-------------------|-------------------|
| | 40 MHz | 20 MHz |
| Normal: 1-Mbps data | Normal: 40 Tq (1) | None |
| 5 Mbps | Data: 8 Tq (1) | |
| Normal: 500-Kbps data | Normal: 80 Tq (1) | Normal: 40 Tq (1) |
| 2 Mbps | Data: 20 Tq (1) | Data: 10 Tq (1) |

Note: Values in () are baud rate prescaler division values.

The clk_c is CANFD ϕ in section 11. Clock Pulse Generator (CPG).

For the CANFD ϕ clock frequency settings, see section 11.

CANFD ϕ maximum frequency are as follows.

RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N, RZ/G2E: 80 (MHz)

48.16.1.4 Setting Receive Rules

Receive rules can be set using registers related to receive rules.

Up to 16 receive rules can be registered per page. Specify pages 0 to 23 (when a unit incorporates six channels) by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Use the AFLDAE bit to set enabling or disabling writing to the receive rule table.

Figure 48.19 shows the receive rule setting procedure.

Figure 48.19 Receive Rule Setting Procedure

48.16.1.5 Setting Buffers

Set the number of buffers (messages to be stored) to be used and interrupt sources of buffers. In CAN FD mode, the size for storing the payload is also set. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

In classical CAN mode, receive and FIFO buffers can use a maximum of 2048-byte RAM. Up to 128 buffers can be used and 16 bytes are used per buffer. The following conditions must be satisfied.

The number of receive buffers

+ The total of depth of receive FIFO buffer x

+ The total of depth of transmit/receive FIFO buffer k \leq 128 buffers

In CAN FD mode, receive and FIFO buffers can use a maximum of 10752-byte RAM. The following conditions must be satisfied.

The number of receive buffers \times (12 + the size for storing the payload)

+ The total of (depth \times (12 + the size for storing the payload) of receive FIFO buffer x

+ The total of (depth \times (12 + the size for storing the payload) of transmit/receive FIFO buffer k

\leq 3584 bytes

Figure 48.20 shows the buffer configuration. Figure 48.21 shows the buffer setting procedure.

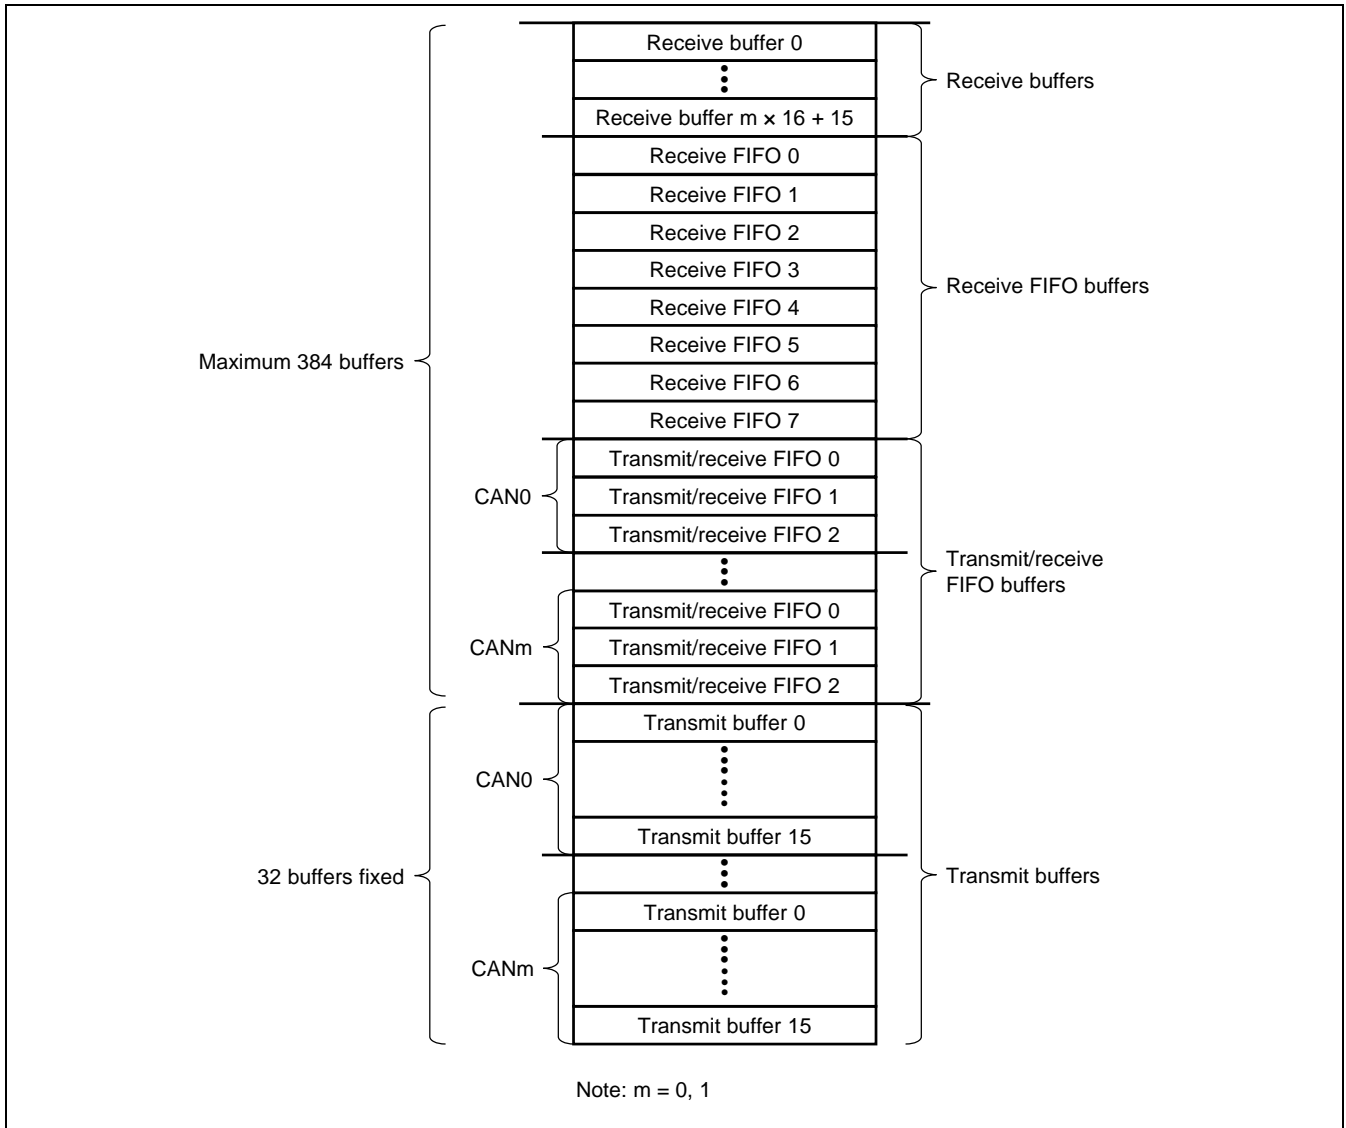

Figure 48.20 Buffer Configuration

Note: Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.

Figure 48.21 Buffer Setting Procedure

48.16.1.6 Transmit Delay Correction (CAN FD Mode Only)

A high baud rate is used for the data phase in CAN FD mode. At this time, the transmit delay correction function is used to enable transmit delay.

When this function is used, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. The timing of the secondary sample point (SSP) used for a data phase must be set by the TDCOC and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing is equal to the sum of the values of the delay measured by the RS-CANFD module and the TDCO[6:0] bits (it is rounded down to T_q which is the approximate integer). The value of the TDCO[6:0] bits must always be the sum of the sample point timing SS and TSEG1.

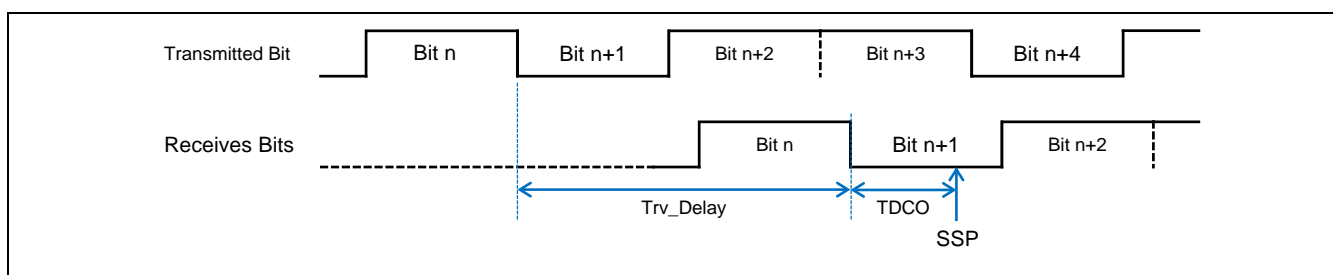

Figure 48.22 SSP Timing

When the TDCOC bit is 1, the SSP timing is only determined by the value of the TDCO[6:0] bits (if the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register are larger than 0, the value of the TDCO[6:0] bits are also rounded down to T_q which is the approximate integer).

The RS-CANFD module corrects the delay of a maximum of $3CAN_m$ bit time - $2T_q$ (the CAN_m bit time and T_q are the values of data bit rate).

48.16.2 Reception Procedure

48.16.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0 to 2, q = 0 to 31) is set to 1 (receive buffer q contains a new message). Messages can be read from the RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (CAN FD mode only), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, and b = 0 to 4 in CAN FD mode) registers. If the next message has been received before the current message is read from the receive buffer, the message is overwritten. Figure 48.23 shows the receive buffer reading procedure. Using this procedure maintains consistency of the message read from the RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers.

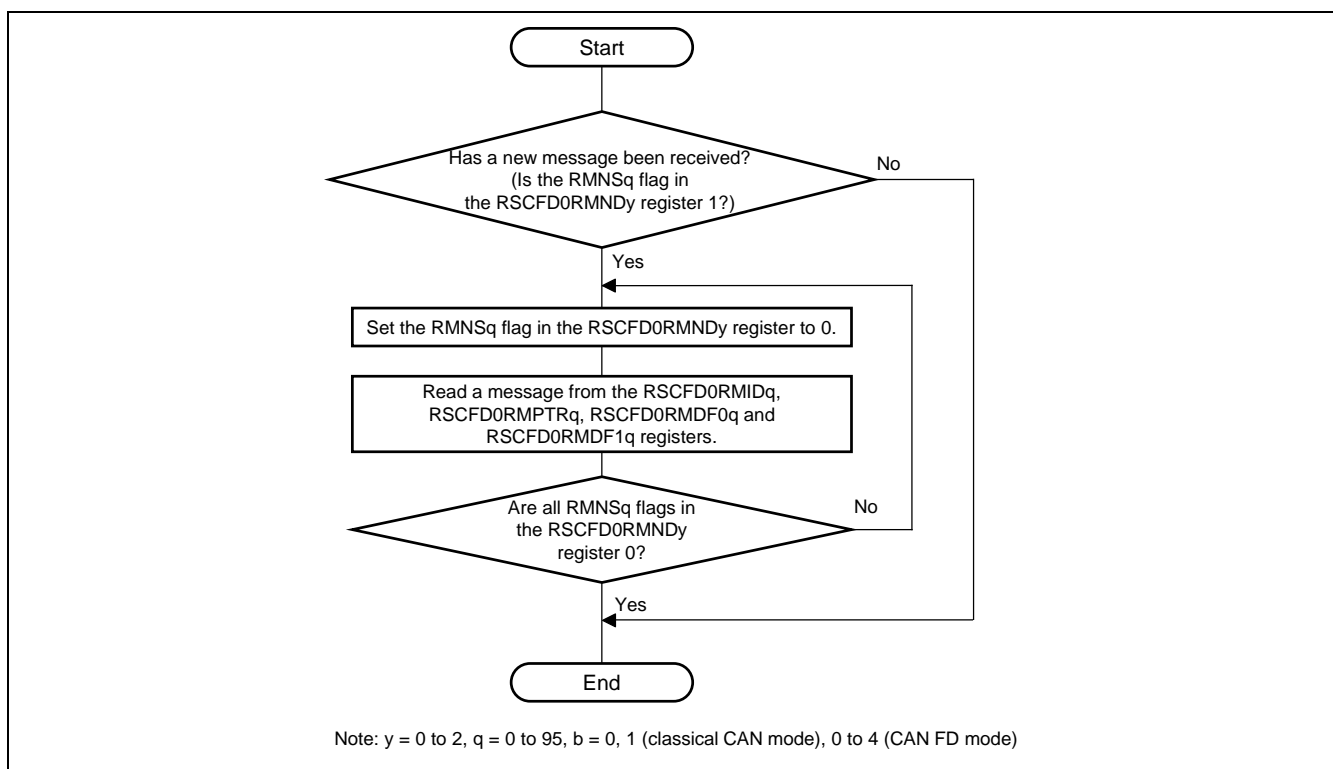

Figure 48.23 Receive Buffer Reading Procedure

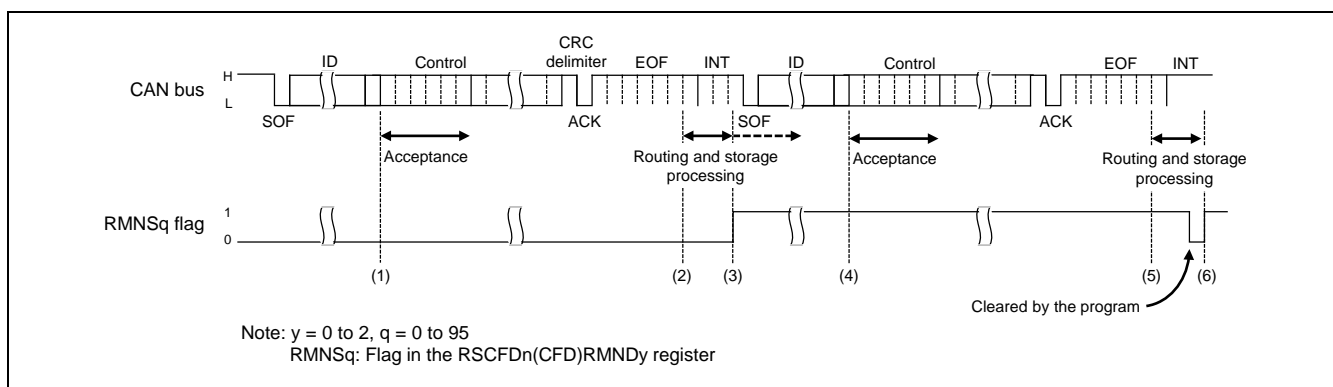

Figure 48.24 Receive Buffer Reception Timing Chart

- (1) When the ID field in a message has been received, the acceptance filter processing starts.
- (2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts. When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.
- (4) When the ID field of the next message has been received, the acceptance filter processing starts.
- (5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag should not be cleared to 0 during storage of messages.

48.16.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message count display counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTS_k register (k = 0 to 5)) is incremented. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCC_k register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDn(CFD)RFFDSTSx (CAN FD mode only), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, and d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDn(CFD)CFDCFFDCSTS_k (CAN FD mode only), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message count display counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCC_k register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTS_k register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTS_k register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.

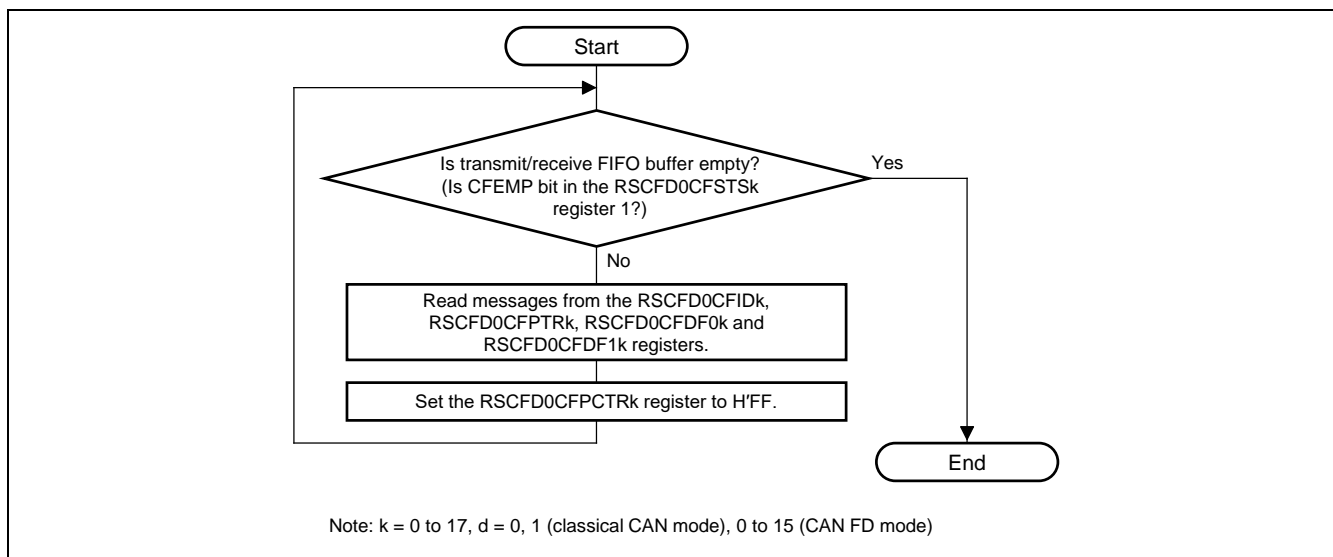

Figure 48.25 Transmit/Receive FIFO Buffer Reading Procedure

When a message is read in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area which exceeds the payload storage size set by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 48.39 Payload Storage Area in the Receive FIFO Buffer

| Value Set by the RFPLS[2:0] Bits | Payload Storage Size | Corresponding Data Field Register |
|-------------------------------------|----------------------|---------------------------------------|
| B'000 | 8 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x |
| B'001 | 12 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x |
| B'010 | 16 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x |
| B'011 | 20 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x |
| B'100 | 24 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x |
| B'101 | 32 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x |
| B'110 | 48 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x |
| B'111 | 64 bytes | RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x |

Table 48.40 Payload Storage Area in the Transmit/Receive FIFO Buffer

| Value Set by the CFPLS[2:0] Bits | Payload Storage Size | Corresponding Data Field Register |
|-------------------------------------|----------------------|---------------------------------------|
| B'000 | 8 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k |
| B'001 | 12 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k |
| B'010 | 16 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k |
| B'011 | 20 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k |
| B'100 | 24 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k |
| B'101 | 32 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k |
| B'110 | 48 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k |
| B'111 | 64 bytes | RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k |

Figure 48.26 FIFO Buffer Reception Timing Chart

- (1) When the ID field in a message has been received, the acceptance filter processing starts.
- (2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.
- (3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is B'001 or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes H'01. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.
- (4) When the ID field of the next message has been received, the acceptance filter processing starts.
- (5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write H'FF to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes H'00, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).
- (6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to B'001 or more. The CFMC[7:0] bit value is incremented by 1 to be H'01. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present). The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to B'001 or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTStx register are set to H'01 by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTStx register is set to 1 (a receive FIFO interrupt request is present).

48.16.2.3 Procedure for Reading FIFO Buffers by the DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by the DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 or 1) assigned to channel m

The DMA enable bit (the RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTC register) can be set at any timing. However, before this bit is set to 1 (the DMA transfer request is enabled), clear the receive interrupt enable bit of the related FIFO (the RFIE bit in the RSCFDnCFDRFCCx register or the CFRXIE bit in the RSCFDnCFDCFCCK register) to 0 (interrupts are disabled). When the DMA transfer request is enabled, do not write the FIFO control register (the RSCFDnCFDRFCCx or RSCFDnCFDCFCCK register).

If there are unread messages in the FIFO buffer that the DMA transfer is enabled, a DMA transfer request trigger will be generated. Specify the address for the FIFO access register to the transfer source address and adjust the transfer size so that the end of the payload storage area is read with a trigger. The end of the payload depends on the payload storage size set by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCK register.

When the end of the payload stored in the FIFO buffer is read, the RFMC[7:0] bits in the RSCFDnCFDRFSTStx register or the CFMC[7:0] bits in the RSCFDnCFDCFSTSk register are automatically decremented by 1. If there is an unread message in the FIFO buffer after the end of the payload is read, a trigger will be generated again.

If the RFDMAEx or CFDMAEm bit is cleared to 0 (the DMA transfer request is disabled) during DMA transfer, wait for the DMA transfer state (the RFDMASTStx or CFDMASTSm bit in the RSCFDnCFDCDTSTStx register) is cleared to 0 (DMA is not being transferred) and perform the next processing (the DMA transfer is enabled again, etc.). When the DMA transfer is disabled, consider handling of messages that have remained in the FIFO buffer and are newly received. When the FIFO buffer is enabled, reception by the FIFO buffer will proceed.

The calculation of payload size should add the ID and PTR, STS. The ID and PTR, STS is the total 12byte.

If the payload size and transfer size of SYS-DMA is mismatch, use the PIO transfer.

The choices of SYS-DMA are following.

- 1byte
- 2byte
- 4byte
- 8byte
- 16byte
- 32byte
- 64byte

48.16.3 Transmission Procedure

48.16.3.1 Procedure for Transmission from Transmit Buffers

Figure 48.27 shows the procedure for transmission from transmit buffers.

Figure 48.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. Figure 48.29 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.

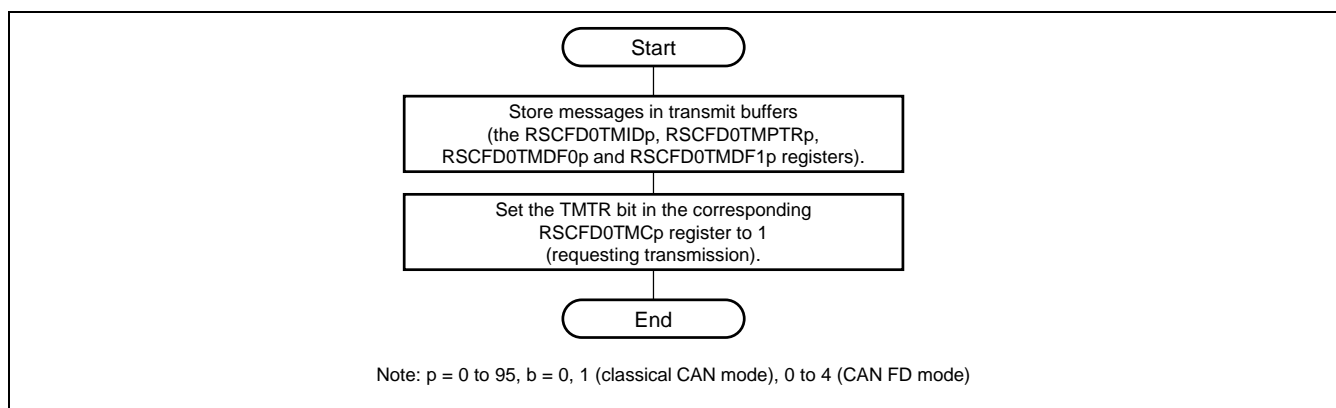

Figure 48.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, transmit buffers (" $(16 \times m) + 0$ " and " $(16 \times m) + 3$ ") can transmit a message which has a payload of 20 bytes or more. In this case, transmit buffers (" $(16 \times m) + 1$ to $(16 \times m) + 2$ " and " $(16 \times m) + 4$ to $(16 \times m) + 5$ ") are assigned to the payload storage areas. The RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp registers corresponding to those buffers, similarly to the RSCFDnCFDTMDFb_p register, can be used as data field registers which store the 4-byte data byte (payload). Table 48.41 shows message storage registers when a message which has a payload of 20 bytes or more is transmitted in transmit buffer 0.

Table 48.41 Message Storage Registers in Transmit Buffer Merge Mode (Transmit Buffer 0)

| Transmit Buffer | Offset from Base Address | Abbreviation | Register Function for Transmit Buffer Merge Mode |
|-------------------|--------------------------|--------------------------------------|--|
| Transmit buffer 0 | H'4000 | RSCFDnCFDTMID0 | ID data, transmit history data storage enable, RTR and IDE bits in transmit buffer 0 |
| | H'4004 | RSCFDnCFDTMPTR0 | Label data and DLC data in transmit buffer 0 |
| | H'4008 | RSCFDnCFDTMFDCTR0 | ESI, BRS, and FDF bits in transmit buffer 0 |
| | H'400C to H'401C | RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0 | Data bytes 0, 1, 2, and 3 in transmit buffer 0 to data bytes 16, 17, 18, and 19 in transmit buffer 0 |
| Transmit buffer 1 | H'4020 | RSCFDnCFDTMID1 | Data bytes 20, 21, 22, and 23 in transmit buffer 0 |
| | H'4024 | RSCFDnCFDTMPTR1 | Data bytes 24, 25, 26, and 27 in transmit buffer 0 |
| | H'4028 | RSCFDnCFDTMFDCTR1 | Data bytes 28, 29, 30, and 31 in transmit buffer 0 |
| | H'402C to H'403C | RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1 | Data bytes 32, 33, 34, and 35 in transmit buffer 0 to data bytes 48, 49, 50, and 51 in transmit buffer 0 |
| Transmit buffer 2 | H'4040 | RSCFDnCFDTMID2 | Data bytes 52, 53, 54, and 55 in transmit buffer 0 |
| | H'4044 | RSCFDnCFDTMPTR2 | Data bytes 56, 57, 58, and 59 in transmit buffer 0 |
| | H'4048 | RSCFDnCFDTMFDCTR2 | Data bytes 60, 61, 62, and 63 in transmit buffer 0 |
| | H'404C to H'405C | RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2 | Not used |

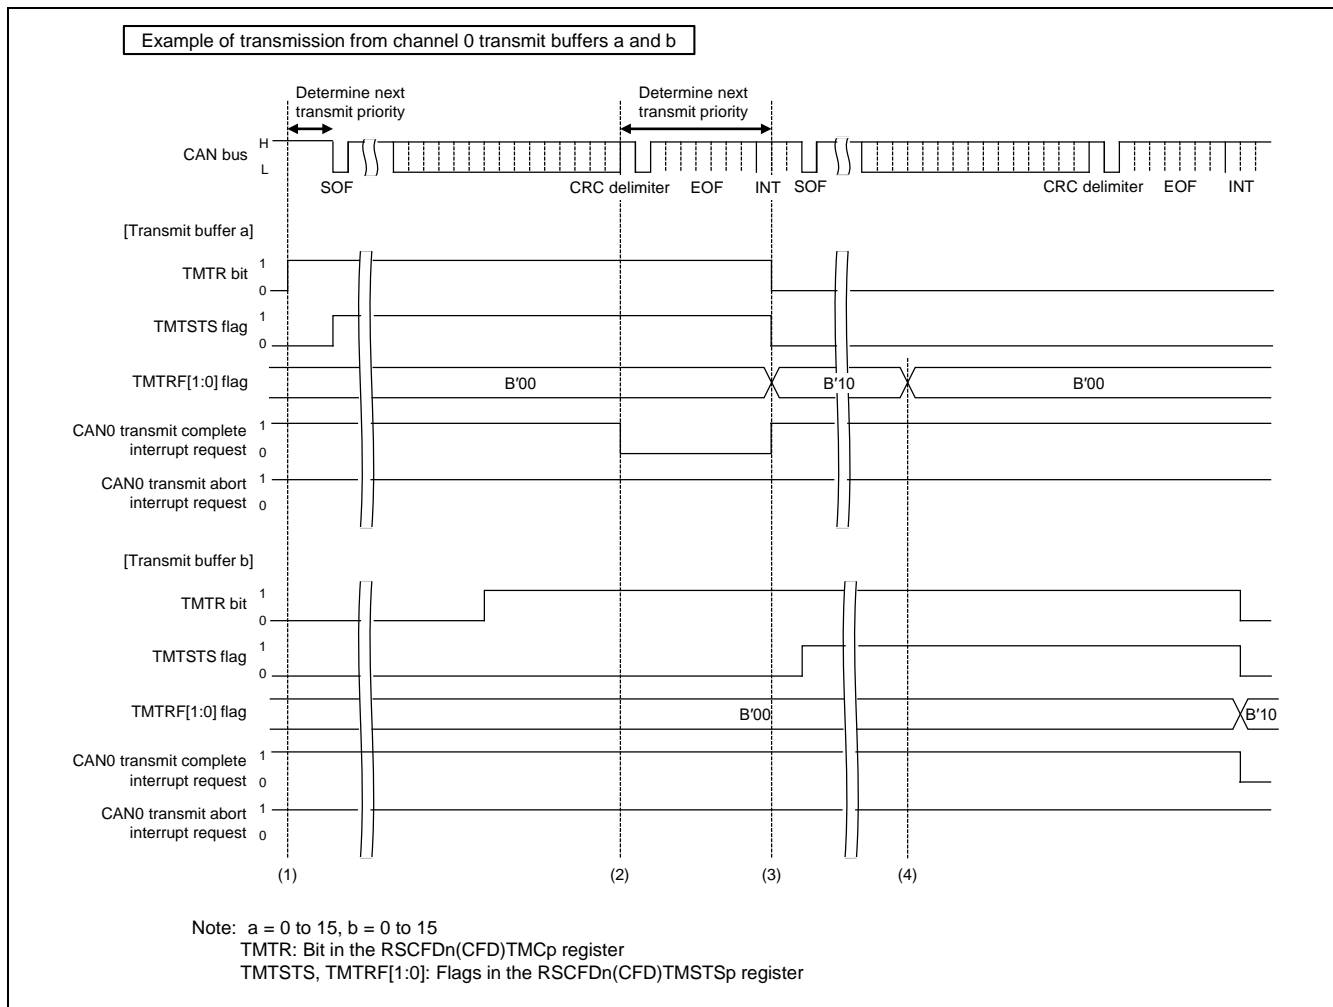

Figure 48.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

- (1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
- (2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to B'10 (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMIEC0 register are cleared to 0. When the TMIEa bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to B'00 (transmission is in progress or no transmit request is present).
- (4) Before starting the next transmission, set the TMTRF[1:0] flag to B'00. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is B'00.

If an arbitration lost has occurred after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration lost, the priority determination processing is reexecuted during transmission of an error frame.

If an ECC2 bit error is detected in the priority determination processing, transmission will not be performed (for classical CAN mode, the EEFEBIT bit in the RSCFDnGCFG register is 1).

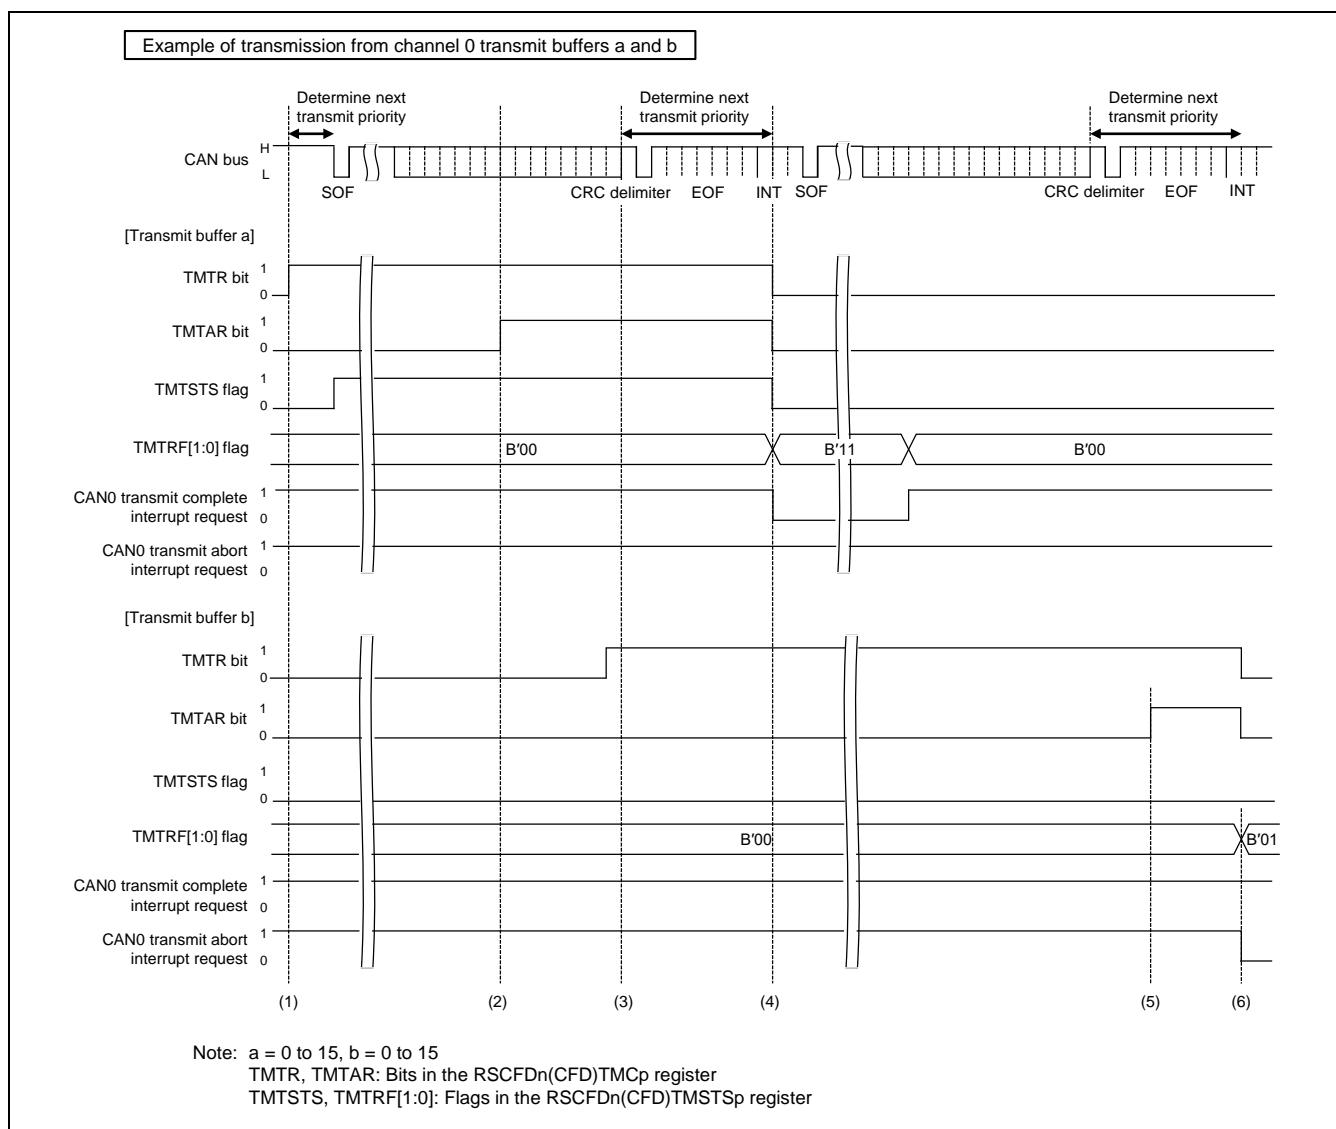

Figure 48.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

- (1) When the TMTR bit in the RSCFDn(CFD)TMCa register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer a is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSa register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.
- (2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).
- (3) The priority determination starts with the CRC delimiter for the next transmission. In this timing chart, buffer b is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSa register is set to B'11 (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCa register are cleared to 0. When the TMIEa value in the RSCFDn(CFD)TMIEC0 register is 1

(transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to B'00 (transmission is in progress or no transmit request is present).

- (5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.
- (6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to B'01. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to B'01. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to B'00.

If an arbitration lost has occurred after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC delimiter to find the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration lost, the priority determination processing is reexecuted during transmission of an error frame.

If an ECC2 bit error is detected in the priority determination processing, transmission will not be performed (for classical CAN mode, the EEFE bit in the RSCFDnGCFG register is 1).

48.16.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 48.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 48.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. Figure 48.32 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.

Figure 48.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When a message is stored, do not write the RSCFDnCFDCFDf_d_k register corresponding to the area which exceeds the payload storage size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCK register.

Table 48.42 Payload Storage Area in the Transmit/Receive FIFO Buffer

| Value Set by the CFPLS[2:0] Bits | Payload Storage Size | Corresponding Data Field Register |
|----------------------------------|----------------------|---------------------------------------|
| B'000 | 8 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf1_k |
| B'001 | 12 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf2_k |
| B'010 | 16 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf3_k |
| B'011 | 20 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf4_k |
| B'100 | 24 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf5_k |
| B'101 | 32 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf7_k |
| B'110 | 48 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf11_k |
| B'111 | 64 bytes | RSCFDnCFDCFDf0_k to RSCFDnCFDCFDf15_k |

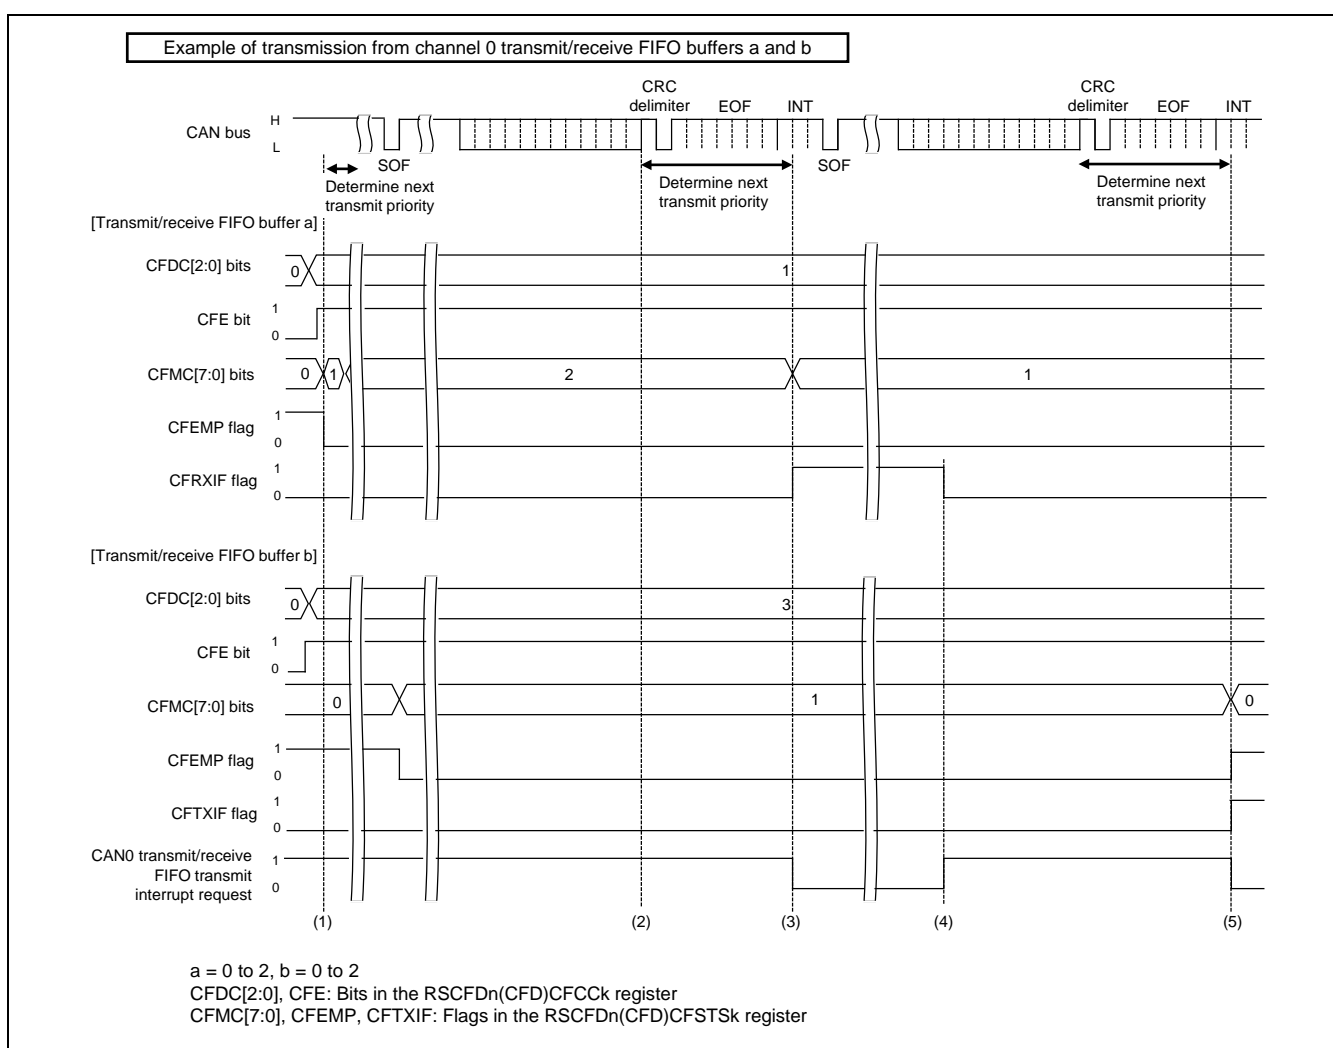

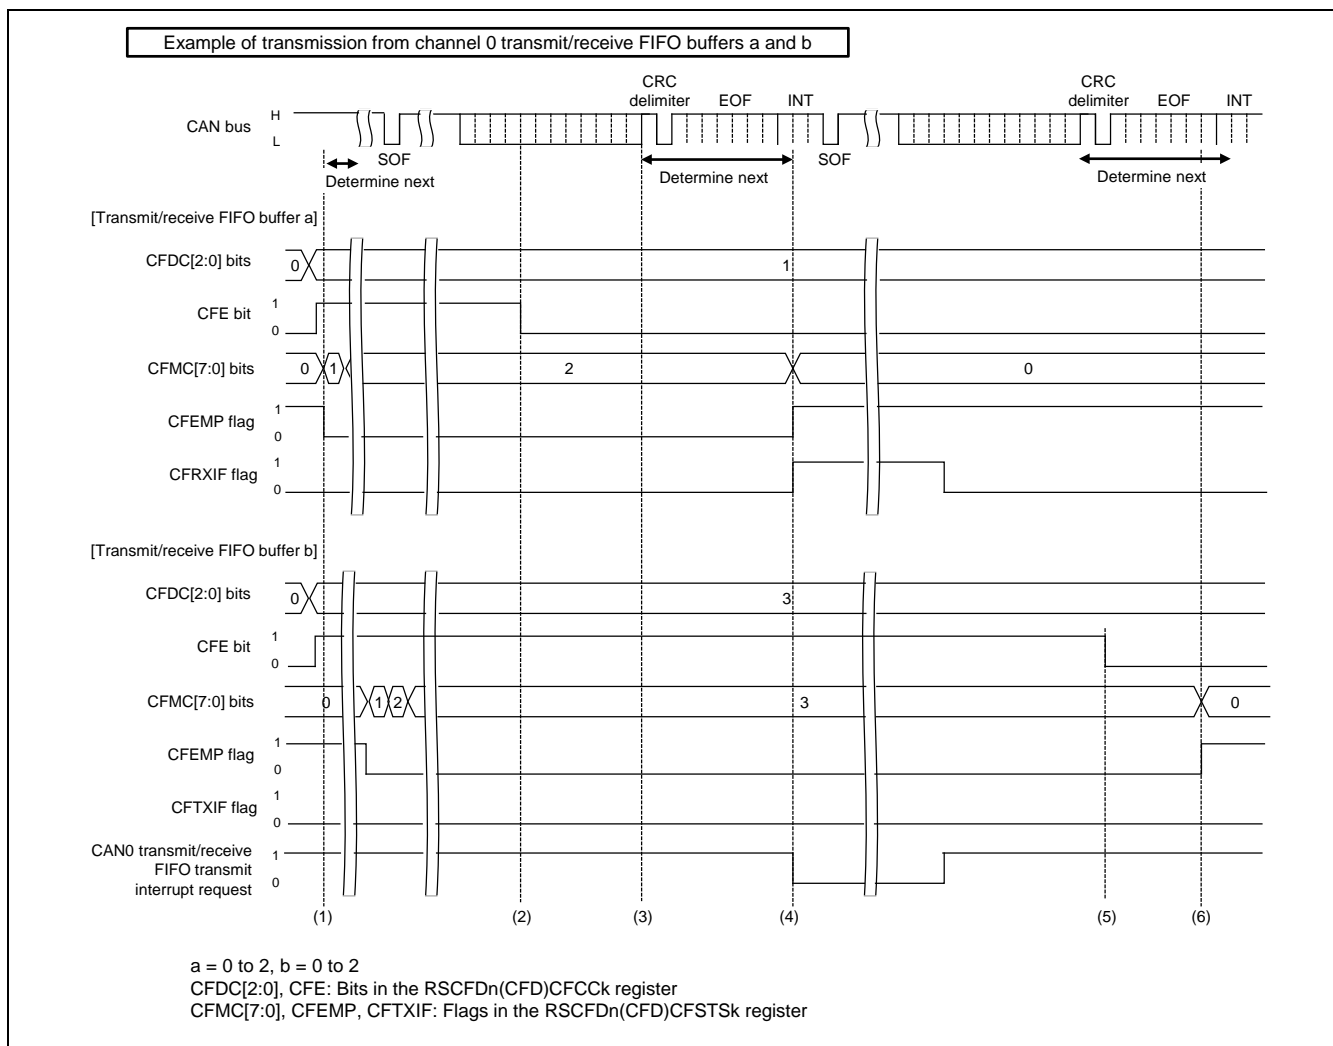

Figure 48.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is B'001 (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H'01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.

- (2) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is decremented. Setting the CFIM bit in the RSCFDn(CFD)CFCCa register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSk register to 1 (a transmit/receive FIFO transmit interrupt request is present).
- (4) The program can clear the CFTXIF flag.
- (5) Message transmission from transmit/receive FIFO buffer b of channel 0 has been completed and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSB register is decremented. The CFMC[7:0] bits are cleared to H'00 and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSa and RSCFDn(CFD)CFSTSB register is set to 1 (the transmit/receive FIFO buffer is full).

**Figure 48.32 Transmit/Receive FIFO Buffer Transmission Timing Chart
(Transmission Abort Completed)**

- (1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCa register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCa register is B'001 (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSa register is H'01 or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer a of channel 0.
- (2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).
- (3) When a transmit request from a buffer is present, the priority determination starts with the CRC delimiter for the next transmission. In this figure, transmit/receive FIFO buffer b is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.
- (4) When transmit completes successfully, the CFMC[7:0] value is cleared to H'00. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSa register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.
- (5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer b), transmit/receive FIFO buffers cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCb register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSa register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)
- (6) After the internal processing time has passed, transmit/receive FIFO buffers are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSa register are cleared to H'00 and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer is immediately disabled. (The CFMC[7:0] bits are cleared to H'00 and the CFEMP flag is set to 1.)

48.16.3.3 Procedure for Transmission from the Transmit Queue

Figure 48.33 shows the procedure for transmission from the transmit queue.

Figure 48.33 Procedure for Transmission from the Transmit Queue

48.16.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing H'FF to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0 or 1) after reading a set of data. Figure 48.34 shows the transmit history buffer reading procedure.

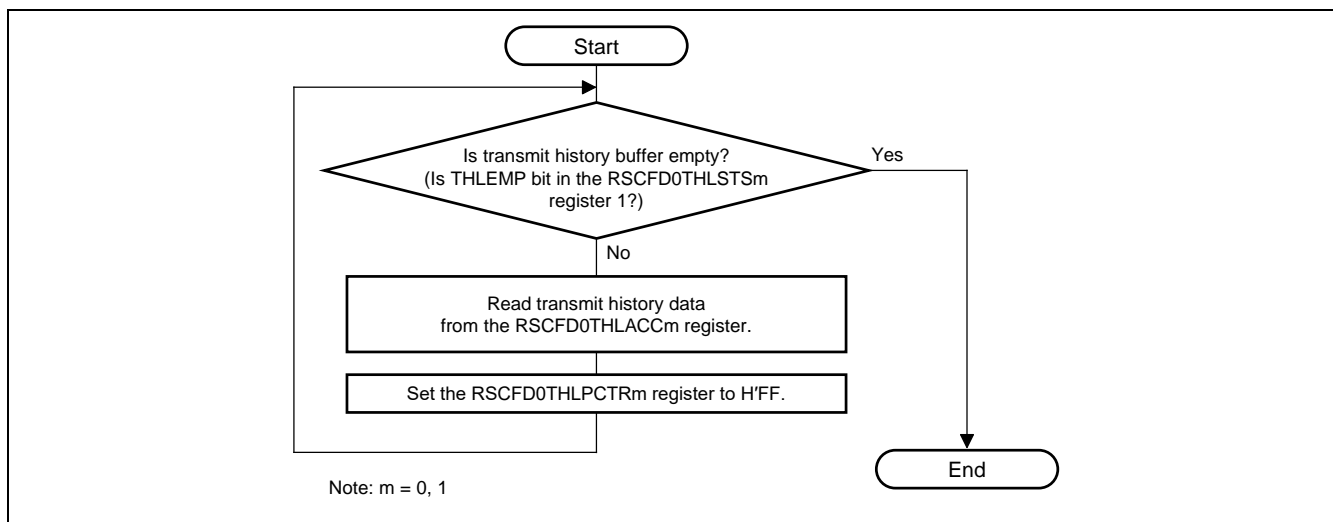

Figure 48.34 Transmit History Buffer Reading Procedure

48.16.4 Test Settings

48.16.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 48.35 shows the self-test mode setting procedure.

Figure 48.35 Self-Test Mode Setting Procedure

48.16.4.2 Procedure for Releasing the Protection

Since the global test function in Table 48.43 is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 48.43 Protection Release Data for Test Function

| Test Function | Protection Release Data 1 | Protection Release Data 2 | Target Bit |
|---------------|---------------------------|---------------------------|---|
| RAM test | H'7575 | H'8A8A | RTME bit in the RSCFDn(CFD)GTSTCTR register |

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. Figure 48.36 shows the procedure for releasing the protection.

Figure 48.36 Protection Release Procedure

48.16.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before closing the RAM test, write H'0000_0000 to all pages of the CAN RAM.

Figure 48.37 shows the RAM test setting procedure.

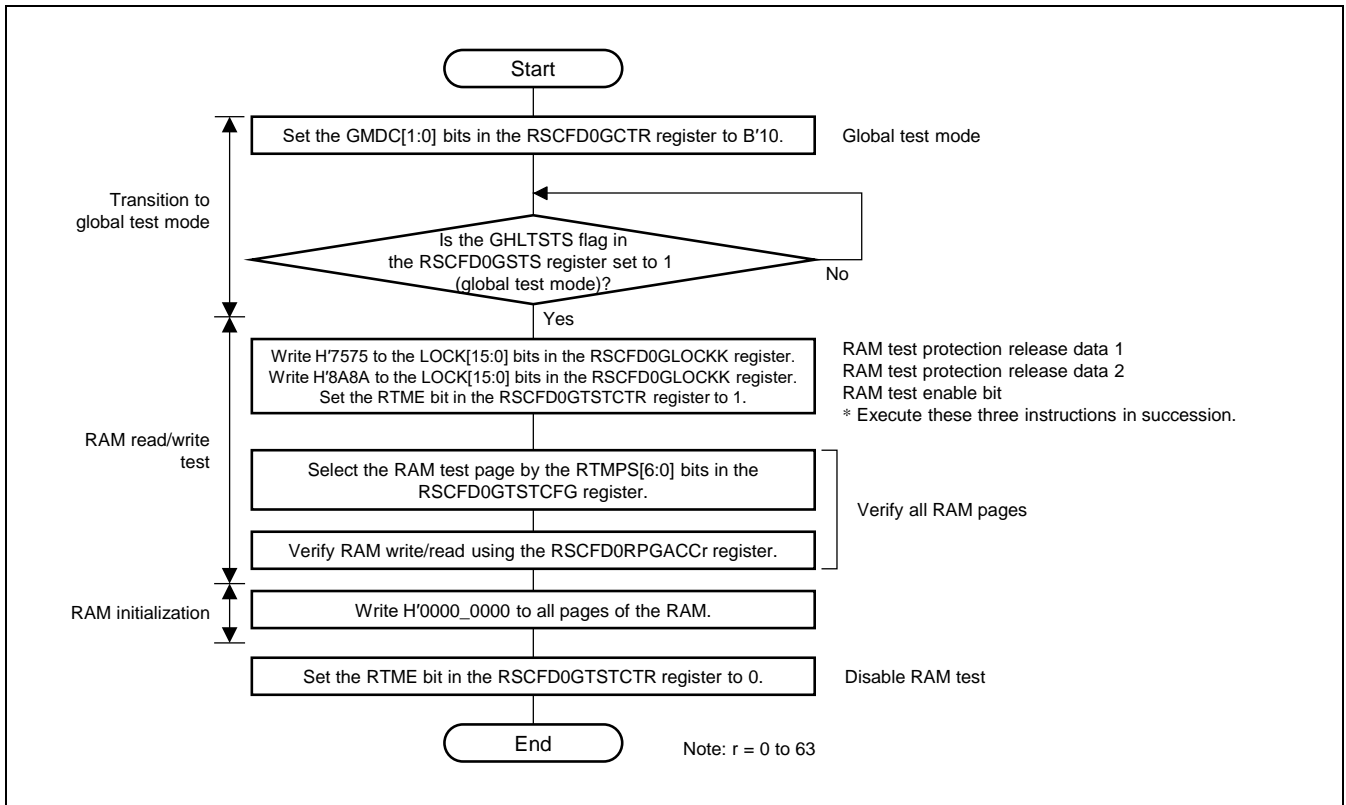

Figure 48.37 RAM Test Setting Procedure

48.16.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 48.38 shows the inter-channel communication test setting procedure.

Figure 48.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

48.17 Usage Notes

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

- When the interface mode is changed without resetting RS-CANFD, write values after a reset to all registers and bits that are not assigned to the switched register map and rewrite the RSCFDnCFDGRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0 or 1) for transitions.
- If a classical CAN frame is only used in CAN FD mode, specify the same value to the RSCFDnCFDCmDCFG register as that specified for the RSCFDnCFDCmNCFG register.
- The acceptance filter processing checks receive rules sequentially in ascending order from the minimum rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the minimum number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to H'00. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTS0 to RSCFDn(CFD)TMTRSTS2, RSCFDn(CFD)TMTARSTS0 to RSCFDn(CFD)TMTARSTS2, RSCFDn(CFD)TMTASTS0 to RSCFDn(CFD)TMTASTS2), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2) to 0 (transmit buffer interrupt is disabled).
- When the transmit buffer merge mode (for CAN FD mode) is used, set H'00 to the control register (the RSCFDn(CFD)TMCp register) of the transmit buffer corresponding to the transmit buffer that has been assigned to the payload storage area. The enable bit of the corresponding interrupt enable registers (RSCFDn(CFD)TMIEC0 to RSCFDn(CFD)TMIEC2 registers) must be cleared to 0 (interrupts are disabled).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be assigned to transmit queues. Additionally, transmit buffers that are assigned to the payload storage area in buffer merge mode (CAN FD mode) must not be assigned to transmit queues.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source in classical CAN mode, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a new received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.
- When registers access RAM, values after a reset described in chapter 48.3, Registers (classical CAN mode), and chapter 48.4, Registers (CAN FD mode), indicate values that have been cleared by initialization of RAM for CAN. Values that have not been cleared are undefined. The registers are shown below.
 - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers)
 - Receive buffer (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers)
 - Receive FIFO buffer access (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)

- Transmit/receive FIFO buffer access (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
- Transmit buffer (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
- Transmit history access (RSCFDn(CFD)THLACCm register)
- RAM test page access (RSCFDn(CFD)RPGACCr register)
- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTsx, and RSCFDn(CFD)RFDFd_x registers), and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CAN module transitions to global operation mode or global test mode after exiting from global reset mode.

49. PCIe Controller

| | |
|-------------|-------------|
| RZ/G2H | |
| RZ/G2M V1.3 | RZ/G2M V3.0 |
| RZ/G2N | RZ/G2E |

49.1 Overview

This module performs PCIe controls, and transfers data between this LSI internal bus (AXI bus) and the PCI devices connected to the PCIe Controller. This module facilitates the design of systems using the PCI Express while at the same time permitting high-speed data transfers in a compact system.

This module functions as a bus bridge connecting the PCI Express to this LSI internal bus (AXI bus), and provides transfer channels between PCI Express devices and devices connected to the LSI internal bus (AXI bus).

This LSI incorporates a PCI Express physical module that supports one lane (×1).

This module has two modes: a Root Port and an Endpoint and can operate as a Root Port or Endpoint that is defined in the PCI Express specification.

49.1.1 Features

This module has the following features.

- The AXI bus clock and APB bus clock that are used in PCIEC are as below.
 - S3D1 ϕ and S3D2 ϕ (RZ/G2H, RZ/G2M V1.3, RZ/G2M V3.0, RZ/G2N)
 - S3D1 ϕ (RZ/G2E)
- Functions as a bridge that connects the PCI Express to the LSI internal bus (AXI bus)
 - Generates a PCIe packet from the AXI bus transaction to the PCI area
 - Generates a AXI bus transaction from a PCI Express packet
- Supports high-speed data transfer between PCI Express devices and internal bus (AXI bus) via the internal DMAC
- Supports the subset of PCI Express Base Specification Revision 2.0 (Dec. 20, 2006)
- Operates as a PCI Express Endpoint or a PCI Express Root Port
- Supports the requester and completer functions for the PCIe transaction
- Incorporates configuration registers and the following capability structures
 - Power management capability structure
 - MSI capability structure (supports masking function and pending bits.)
 - PCI Express capability structure
 - Virtual channel capability structure
- Supports interrupts by INTx and MSI
- Supports one lane (×1)
- Supports multiple speeds (2.5 GT/s and 5.0 GT/s).
- Automatically performs link training and link configurations
- Supports the D+/D-line automatic swap function (lane polarity inversion)
- Achieves QoS through transaction ordering.
- Automatically performs flow control by managing six types of credits
- Automatic handling function by hardware
- Buffer for holding error packet headers and error indication status provided
- Supports the link power control function (L0, L0s, and L1 states)
- Supports device power control function (D0, D3 hot, and D3 cold states).

- Supports 128-byte max payload size.
- Supports completion timeout disable.

Note: This module does not support the following PCI Express functions.

- Expansion ROM for system boot
- Card bus
- Phantom function
- Power-management event (PME) handling by hardware
- Slot function (including Hot Plug)
- AER function
- BIST function
- Surprise Down error function
- ARI forwarding function
- Port arbitration function
- Peer-to-peer transfer
- Separate Refclk Architecture

49.1.2 Block Diagram

Figure 49.1 shows a block diagram of the PCIE Controller.

The PCIE Controller comprises a bridge, PCIE Controller, and PCIE Controller physical unit.

The bridge provides the bridge function of connecting the internal bus (AXI bus) to the PCI Express controller.

The PCIE Controller is a block that controls the PCI Express packet transmission and reception, and it implements the functions of transaction and data link layers that are defined by the PCI Express standards. The configuration registers defined by the PCI Express standards are installed in this block.

The PCIE Controller physical unit is a block that controls PCI Express transmission paths, and implements the physical layer function that is defined by the PCI Express standards.

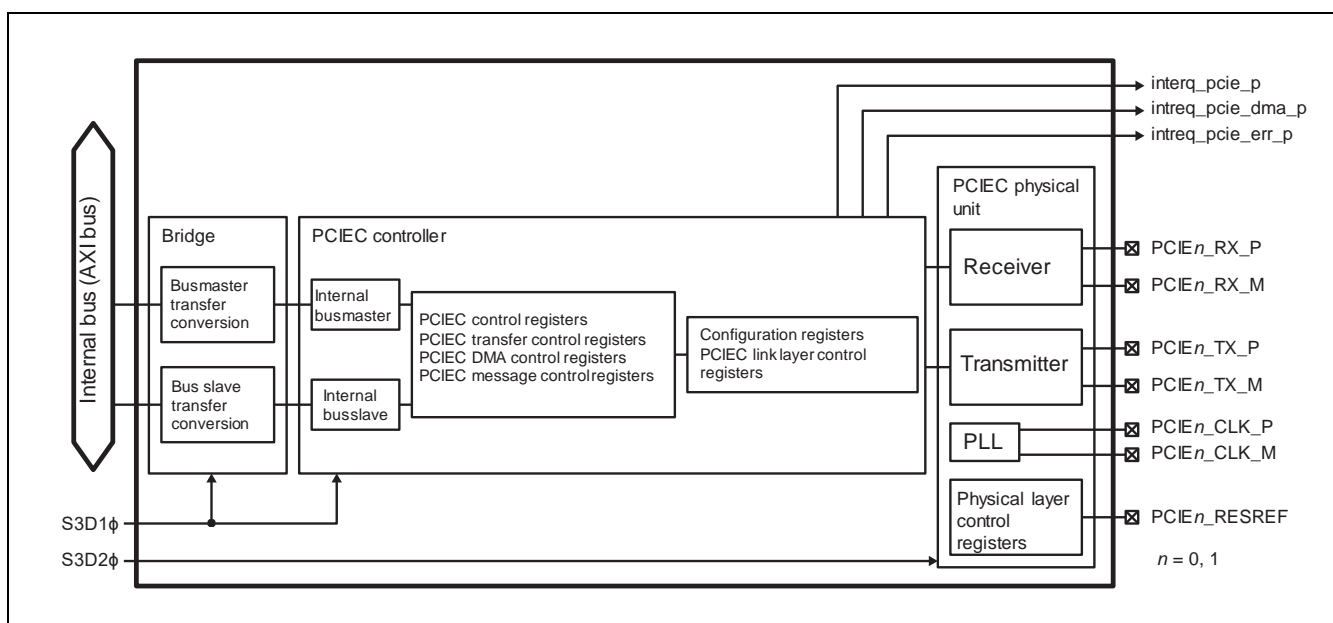

Figure 49.1 Block Diagram

49.1.3 External Pins

Table 49.1 shows the pin configuration.

Table 49.1 Pin Configuration

| Signal Name | Signal Conforming to PCI Standard | I/O | Description | Second Generation RZ/G Series Products | | | | |
|--|-----------------------------------|--------|--|--|----------------------------|--------|--------|--|
| | | | | RZ/G2H | RZ/G2M V1.3 RZ/G2M V3.0 | RZ/G2N | RZ/G2E | |
| PCIE _n _CLK_P* PCIE _n _CLK_M* (n = 0, 1) | REFCLK+ | Input | Reference clock inputs to the PLL incorporated in the PCIE Controller module (differential inputs). 100-MHz clock should be applied. | √ | √ | √ | √ | |
| PCIE _n _TX_P* PCIE _n _TX_M* (n = 0, 1) | PETp0 PETn0 | Output | Transmit data pins used by a physical module, where 2.5- or 5.0-GHz signals are propagated. (Differential output) | √ | √ | √ | √ | |
| PCIE _n _RX_P* PCIE _n _RX_M* (n = 0, 1) | PERp0 PERn0 | Input | Receive data pins used by a physical module, where 2.5- or 5.0-GHz signals are propagated. (Differential input) | √ | √ | √ | √ | |
| PCIE _n _RESREF* (n = 0, 1) | — | InOut | Reference Resistor Connection Attach a 200-Ω ±1% ±100 ppm/°C precision resistor-to-ground on the board. | √ | √ | √ | — | |

Note: RZ/G2E supports only one channel (n = 0).

49.1.4 Register Configuration

Table 49.4 shows the PCIE Controller registers and Table 49.5 shows the PCIE Controller phy registers. In these table, the Address Offset columns show an offset for each register from the PCIE Controller base address or the PCIE Controller phy base address. The actual access address is obtained by adding each offset to the PCIE Controller base address or the PCIE Controller phy base address. Table 49.2 shows the PCIE Controller base address and Table 49.3 shows the PCIE Controller phy base address. These registers should be accessed through the AXI bus. Only the little endian mode can be used for this module.

Table 49.2 PCIE Controller Base Address

| | PCI Express |
|--------------------|-------------|
| PCIE0 Base Address | H'FE00_0000 |
| PCIE1 BaseAddress | H'EE80_0000 |

Notes: 1. AX: AXI bus (internal bus)

PCI: PCI local bus

'—' in R/W column: Access prohibited.

For details of R/W attribute for each bit, see section 49.2, Register Description.

2. Depends on the setting of the local address mask register 0.

3. R/W changes by the state. RootPort:R/W.EndPoint:R.

4. Depends on the setting of the local address mask register 1.
5. Depends on the setting of the local address mask register 2.
6. Depends on the setting of the local address mask register 3.
7. Depends on the setting of the local address mask register 4.
8. Depends on the setting of the local address mask register 5.

Do not write to any addresses other than listed above. Operations cannot be guaranteed if writing is attempted. Values read from addresses other than those listed above are undefined.

Table 49.5 PCIE Controller Phy Register Configuration

| Register Name | Abbreviation | AX*1 R/W | PCI*1 R/W | Address Offset | Initial Value | Access Size | Second Generation RZ/G Series Products | | | | |
|----------------------------|--------------|-------------|--------------|-------------------|---------------|----------------|---|----------------------------|--------|--------|--|
| | | | | | | | RZ/G2H | RZ/G2M V1.3 RZ/G2M V3.0 | RZ/G2N | RZ/G2E | |
| PCIEC Phy registers | | | | | | | | | | | |
| PHY clock register | PHY_CLK | R/W | — | H' 4004 | H'0000_0119 | 32 | √ | √ | √ | — | |

49.1.5 Connected Module

Table 49.6 Connected modules

| Module name | Connected module name | Function of connected module |
|-------------|-----------------------|------------------------------|
| PCIEC | AP-System Core | Access the Registers |
| | CPG | Output clocks |
| | Module Standby | Control to stop clocks |
| | Software Reset | Execute software reset |
| | INTC-AP | Control to interrupt |

49.2 Register Description

[Legend for the Register Description]

A bit assignment figure is shown for each register. The initial value and R/W attribute are indicated for each bit.

Bit: Bit number or bit range

Bit Name: Bit name or field name

Initial value: Register value after a reset

—: Undefined value

R/W: Readable/writable. The written value can be read.

RW1C: Readable/writable. The bit is initialized when 1 is written. Writing 0 is ignored.

R: Read-only. The write value should always be 0. (If there is a direction on a read or write value in the Description column, set the bit as directed.)

RWS*: Sticky-read write bit. Readable/writable. The bit is not initialized by a hot reset.

RW1CS*: Sticky-read-only status bit. The bit is initialized when 1 is written. Writing 0 is ignored. The bit is not initialized by a hot reset.

Note: * RWS and RW1CS are only used for the configuration registers. For details, see section 49.4.1, Write/Read Attributes of Configuration Registers.

49.2.1 Configuration Transmission Address Register (PCIECAR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 24 | BN | H'00 | R/W | Bus Number Specifies the number of the bus to be accessed when a configuration request is issued. |
| 23 to 19 | DN | B'0_0000 | R/W | Device Number Specifies the number of the device to be accessed when a configuration request is issued. Note: A type 0 configuration request can be issued only to device #0; do not send a type 0 configuration request to the device with the other number. |
| 18 to 16 | FN | B'000 | R/W | Function Number Specifies the number of the function to be accessed when a configuration request is issued. |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 to 8 | EREGNO | H'0 | R/W | Extended Register No. Specifies the number of the extended register to be accessed when a configuration request is issued. |
| 7 to 2 | REGNO | H'00 | R/W | Register No. Specifies the number of the register to be accessed when a configuration request is issued. |
| 1, 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

49.2.2 Configuration Transmission Control Register (PCIECCTLR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

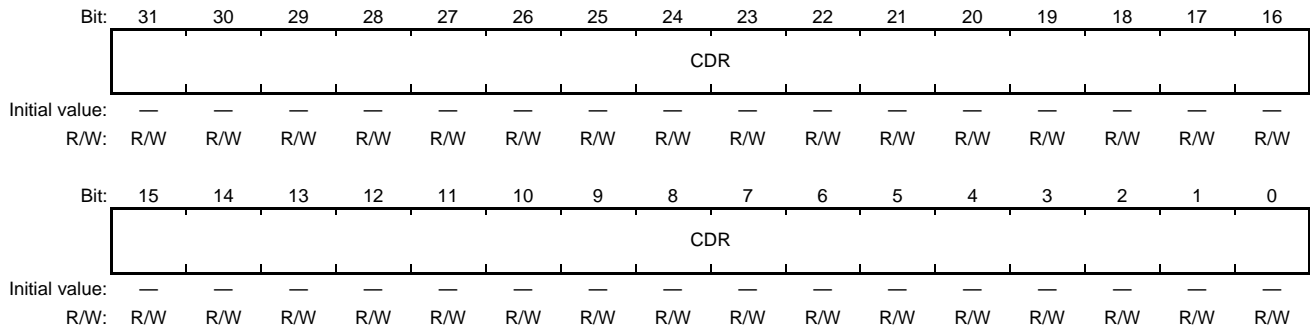

| | | | | | | | | | | | | | | | | |
|----------------|------|----|----|----|----|----|----|------|----|----|------|------|----|----|------|------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | CCIE | — | — | — | — | — | — | — | — | — | WUR | WCRS | — | — | RUR | RCRS |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R | R | R | RW1C | RW1C | R | R | RW1C | RW1C |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | — | TYPE | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|------|---|
| 31 | CCIE | B'0 | R/W | Configuration Send Enable Enables issuance of a configuration request. Set to 1 when the configuration transmission address register and configuration transmission data register are used to issue the configuration cycle. |
| 30 to 22 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 21 | WUR | B'0 | RW1C | Write Unsupported Request Indicates that an unsupported request has been received. This bit is set to 1 when a completion with the unsupported request status is received in response to the configuration write request transmitted. |
| 20 | WCRS | B'0 | RW1C | Write CRS Indicates that CRS (configuration retry status) has been received. This bit is set to 1 when a completion with the CRS status is received in response to the configuration write request transmitted. |
| 19, 18 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 17 | RUR | B'0 | RW1C | Read Unsupported Request Indicates that an unsupported request has been received. This bit is set to 1 when a completion with the unsupported request status is received in response to the configuration read request transmitted. |
| 16 | RCRS | B'0 | RW1C | Read CRS Indicates that CRS (configuration retry status) has been received. This bit is set to 1 when a Completion with the CRS status is received in response to the configuration read request transmitted. |
| 15 to 9 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
| 8 | TYPE | B'0 | R/W | TYPE Specifies the type of a configuration request issued by accessing the PCIECDR register. 0: Type 0 configuration request 1: Type 1 configuration request Note: A type 0 configuration request can be issued only to device #0; do not send a type 0 configuration request to the device with the other number. |
| 7 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

49.2.3 Configuration Transmission Data Register (PCIECDR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|----------|---------------|-----|--|
| 31 to 0 | CDR | Undefined | R/W | <p>Configuration Data Register</p> <p>Allows a configuration request to be issued.</p> <p>A write access to this field allows issuance of a configuration write request containing the information written to this field as data.</p> <p>A read access to this field allows issuance of a configuration read request and reading of the data contained in the response.</p> <p>When the peer device returns an unsupported request response, the read value is H'FFFF_FFFF.</p> <p>When EXPCAP7[4].CRSVISE = 0:</p> <p>When the peer device returns a CRS response, the read value is H'FFFF_FFFF (error response).</p> <p>When EXPCAP7[4].CRSVISE = 1:</p> <p>Until the peer device returns a response other than a CRS response, the first access to the peer device should be a read access to register address 0.</p> <p>When the peer device returns a CRS response, the read value is H'FFFF_0001.</p> <p>In Endpoint mode, this field must not be accessed.</p> <p>Except when PCIECTLR.CCIE = 1 and PCIETCTLR.CFINIT = 1, the read value is H'FFFF_FFFF.</p> |

49.2.4 Mode Setting Register (PCIEMSR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|---------|-----------|---------------|-----|---|
| 31 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | ASTUNLOCK | B'0 | R/W | Assert Unlock Specifies issuance of an unlock message. Writing 1 to this bit allows issuance of an unlock message (message code = B'0000_0000; routing = B'011). Transmission of an unlock message through a write access to this bit can be used only in Root Port mode. Transmission of an unlock message from an Endpoint is prohibited by the standard. While a link is not established, do not write 1 to this bit. This bit is always read as 0. |

49.2.6 INTx Register (PCIEINTXR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|-------|-------|-------|-------|----|----|----|----|------|------|------|-------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ASTINT X |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | INTDE | INTCE | INTBE | INTAE | — | — | — | — | INTD | INTC | INTB | INTA |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|--|
| 31 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | ASTINTX | B'0 | R/W | Assert INTx Specifies generation of an INTx interrupt. Writing 1 to this bit asserts the INTx interrupt specified by the PCICONF15[15:8].Interrupt Pin bits and writing 0 deasserts the INTx interrupt. When generating an INTx interrupt using this bit, the PCICONF1[10].INTDIS bit must be 0. This bit is cleared if the PCICONF1[10].Interrupt Disable bit is set to 1 while this bit is 1. When MSI is used, an INTx interrupt cannot be used. Therefore, when the MSICAP0[16].MSI Enable bit is 1, 1 cannot be written to this bit. This bit is cleared if the MSICAP0[16].MSI Enable bit is set to 1 while this bit is 1. This bit is valid only in Endpoint mode. When a link goes down, this bit is cleared. A write access is ignored while a link is down. |
| 15 to 12 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 11 | INTDE | B'0 | R/W | INTD Enable Enables generation of an interrupt by INTD assertion. This bit is valid only in Root Port mode. |
| 10 | INTCE | B'0 | R/W | INTC Enable Enables generation of an interrupt by INTC assertion. This bit is valid only in Root Port mode. |
| 9 | INTBE | B'0 | R/W | INTB Enable Enables generation of an interrupt by INTB assertion. This bit is valid only in Root Port mode. |
| 8 | INTAE | B'0 | R/W | INTA Enable Enables generation of an interrupt by INTA assertion. This bit is valid only in Root Port mode. |
| 7 to 4 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|-----|----------|---------------|-----|---|
| 3 | INTD | B'0 | R | Indicates that INTD has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTD message and deasserted upon reception of a Deassert_INTD message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[11].INTDE is 1, the interrupt is generated. This bit is valid only in Root Port mode. |
| 2 | INTC | B'0 | R | Indicates that INTC has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTC message and deasserted upon reception of a Deassert_INTC message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[10].INTCE is 1, the interrupt is generated. This bit is valid only in Root Port mode. |
| 1 | INTB | B'0 | R | Indicates that INTB has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTB message and deasserted upon reception of a Deassert_INTB message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[9].INTBE is 1, the interrupt is generated. This bit is valid only in Root Port mode. |
| 0 | INTA | B'0 | R | Indicates that INTA has been asserted by a PCI Express interrupt. This bit is asserted upon reception of an Assert_INTA message and deasserted upon reception of a Deassert_INTA message. When this bit is asserted while PCICONF15[7:0].Interrupt Line is not H'FF and PCIEINTXR[8].INTAE is 1, the interrupt is generated. This bit is valid only in Root Port mode. |

49.2.7 Message Reception Status Register (PCIERMSGR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |

| | — | — | — | SLOT_P OWERE | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R/W | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|---|
| 31 to 13 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 12 | SLOT_POWERE | B'0 | R/W | SLOT_POWERE Enables generation of an interrupt upon reception of a Set_Slot_Power_Limit message. |
| 11 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

49.2.9 Power Management Message Transmission Control Register (PCIEPMMMSGCR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|--------|----|----|----|----|----|----|----|----|----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | — | — | — | — | — | — | PM_PME | — | — | — | — | — | — | — | — | — |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R/W | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|-----|---|
| 31 to 10 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 9 | PM_PME | B'0 | R/W | Specifies issuance of a PM_PME message. Writing 1 to this bit allows issuance of a PM_PME Message (message code = B'0001 1000; routing = B'000). This bit is always read as 0. Transmission of a PM_PME message through a write access to this bit can be used only in Endpoint mode. Transmission of a PM_PME message from a Root Port is prohibited by the standard. While a link is not established, do not write 1 to this bit. |
| 8 to 0 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

49.2.10 Physical Layer Status Register (PCIEPHYSR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| | | | | | | | | | | | | | | | | |
|----------------|----|----|----|----|----|----|----|--------------|----|----|----|----|----|----|----|-------------|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | — | — | — | — | — | — | — | PHYRD YCE | — | — | — | — | — | — | — | PHYRD YC |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PHYRD Y |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|----------|---------------|------|--|
| 31 to 25 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 24 | PHYRDYCE | B'0 | R/W | PHYRDY Change Enable Enables generation of an INT_PCISC interrupt upon change of PHYRDY. |
| 23 to 17 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 16 | PHYRDYC | B'0 | RW1C | PHYRDY Change Indicates that PHYRDY has changed. |
| 15 to 1 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 0 | PHYRDY | B'0 | R | 0: Indicates that the clock supplied by the physical layer has not been stabilized and that it is not ready to be used. 1: Indicates that the clock supplied by the physical layer has been stabilized and that it is ready to be used. |

49.2.11 MSI Transmission Register (PCIEMSITXR)

| | | | |
|--------|--------------------------|--------|--------|
| RZ/G2H | RZ/G2M V1.3, RZ/G2M V3.0 | RZ/G2N | RZ/G2E |
| √ | √ | √ | √ |

| | | | | | | | | | | | | | | | | |
|----------------|-------------|----|----|----|----|----|----|----|----|----|----|--------|-----|-----|-----|-----|
| Bit: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| | MSIE | — | — | — | — | — | — | — | — | — | — | MMENUM | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | MSIPC LR | — | — | — | — | — | — | — | — | — | — | MSIAST | | | | |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W: | R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | Bit Name | Initial Value | R/W | Description |
|----------|-------------|---------------|-----|--|
| 31 | MSIE | B'0 | R | MSI Enable Indicates the MSICAP0[16]. MSIE value. |
| 30 to 21 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |
| 20 to 16 | MMENUM | B'0_0000 | R | Multiple Message Enable Number Indicates the number of sources specified with MSICAP0[22:20].MMESE. B'0_0000: 1 source (only source number 0 is available) B'0_0001: 2 sources (source numbers 0 and 1 are available) B'0_0011: 4 sources (source numbers 0 to 3 are available) B'0_0111: 8 sources (source numbers 0 to 7 are available) B'0_1111: 16 sources (source numbers 0 to 15 are available) B'1_1111: 32 sources (source numbers 0 to 31 are available) |
| 15 | MSIPC LR | B'0 | R/W | MSI Pending Clear Forcibly clears the MSI interrupt sources to be transmitted. If the MSI source is canceled because of the user side reason (internal source), set the information of the MSI interrupt to be cleared to the MSI Assert field, and simultaneously write 1 to this bit. In the other cases, hold this bit to 0. This bit is always read as 0. |
| 14 to 5 | — | All 0 | R | Reserved These bits are always read as 0. The write value should always be 0. |

| Bit | Bit Name | Initial Value | R/W | Description |
|--------|----------|---------------|-----|--|
