

Military 24-Pin PAL Devices

Features

- Registers with feedback
- Programmable three-state outputs
- Security fuse prevents duplication of logic
- Variety of speed/power options available in same architecture
- Register preload to aid in device testing
- Power-up reset to logical high
- Programmable output polarity
- Product term sharing
- Programmable register or combinatorial outputs
- Dual feedback allows buried state registers or input registers (PAL32VX10)
- Programmable flip-flops allow J-K, S-R, T or D types (PAL32VX10)
- Asynchronous preset/synchronous reset, synchronous preset/asynchronous reset (PAL32VX10)
- Through-hole or surface mount device packaging
- Neutron fluence (permanent damage): 1×10^{13} N/cm²
- Dose rate (transient upset) junction isolated Bipolar processes: 2×10^{10} RADs (Si) per sec recovered in 50 to 70 μ s from a 1 μ s pulse

Benefits

- Instant prototyping/zero NRE charge
- Low-cost programmable replacement for TTL logic
- Reduces inventory by reducing chip count
- Programmed on standard PROM/PAL device programmers
- Several software programs available to assist in creating bit pattern designs

Applications

- High speed graphic controllers
- High speed computers
- High frequency state machines
- High frequency counters
- Microprocessor clock generation and interface logic
- DMA controllers
- Asynchronous bus interface
- CRT controllers
- Peripheral/handshaking interface
- Interrupt controllers
- Memory mapped I/O (PAL8L14A)
- Microprocessor decoder (PAL8L14A)

24-Pin PAL Device Speed vs. Power

Military 24-Pin PAL Devices

Register Preload

Register preload is an aid to functional testing, which is usually performed after the device is programmed but before it is installed on the circuit board. Using register preload, the register of a device can be "preloaded" to any desired state value. This is particularly useful in applications where the output is fed back into the array as an input, since it may take many state transitions to reach a desired state in the output register. Register preload also allows the user to set the device to an "illegal" state which cannot be reached through normal state transitions, in order to test for proper recovery.

Power-Up Reset

Another added testability feature found on these Series is power-up reset. Power-up reset makes system initialization simple; registers are reset to logic 0 at power-up, thus all outputs are set to logic 1.

The table below is a brief summary of our current devices that do have register preload and/or power-up reset.

Devices with Register Preload and Power-Up Reset

DEVICE FAMILY	REGISTER PRELOAD	POWER-UP RESET
Exclusive OR 24XA	YES	YES
Shared Product terms 24RS	YES	YES
Asynchronous 24RA	YES	YES
Varied Product terms 24VX*	YES	YES

* The PAL32VX10/10A has power-up preset; registers are set to logical 1 on power up.

- Notes:
1. t_{PD} is tested with switch S_1 closed, $C_L = 50$ pF and measured at 1.5 V output level.
 2. t_{PZX} is measured at the 1.5 V output level with $C_L = 50$ pF. S_1 is open for high impedance "1" test and closed for high impedance "0" test.
 3. t_{PXZ} is tested with $C_L = 5$ pF. S_1 is open for "1" to high impedance test measured at $V_{OH} - 0.5$ V output level. S_1 is closed for "0" to high impedance test measured at $V_{OL} + 0.5$ V output level.
 4. Equivalent test loads may be used on automatic test equipment.

Output Register Preload PAL24XA Series, PAL24RS Series and PAL20RA10 Device

1. Raise V_{CC} to 4.5 V.
2. Disable output registers by setting pin 13 to V_H .
3. Apply V_{IL}/V_{IH} to all registered output pins.
4. Pulse pin 10 to V_p then back to 0 V.
5. Remove V_{IL}/V_{IH} from all output registers.
6. Lower pin 13 to V_{IL} to enable the output registers.
7. Verify for V_{OL}/V_{OH} at all registered output pins.

Output Register Preload PAL32VX10 Device

The preload function allows the register to be loaded from the output pins. This feature aids the functional testing of sequential designs by allowing direct setting of output states. The procedure is:

1. Raise V_{CC} to 4.5 V.
2. Disable output registers by setting pin 2 to V_{IH} (12 V).
3. Apply V_{IL}/V_{IH} to all registered output pins. Leave combinatorial outputs floating.
4. Pulse pin 10 to V_{IH} , then back to 0 V.
5. Remove V_{IL}/V_{IH} from all output registers.
6. Remove high voltage from pin 2.
7. Enable registered outputs per programmed pattern.
8. Verify for V_{OL}/V_{OH} at all registered output pins.
