AN30251A

Driver IC for White LED's

■ Overview

AN30251A is a step-up DCDC converter that drives an external NMOS power transistor using a constant frequency PWM architecture.

■ Features

- Operation from 3.0 to 5.5 V supply voltage.
- Low Power Operation (1 mA typ.)
- Incorporates various protections (below).
 - Low Input voltage detection.
 - Short circuit detection of a timer.
 - Soft-start circuit.
 - Over voltage detection.
- 1 μ A or less shutdown current
- 2 current modes (Flash Mode / Torch Mode) selectable.

■ Applications

- White LED's of Mobile Phone

■ Package

- 16 pin Plastic Quad Flat Non-leaded Package (QFN type)

■ Type

- Bi-CMOS IC

■ Absolute Maximum Ratings

A No.	Parameter	Symbol	Rating	Unit	Notes
1	Supply voltage	V_{CC}	6.0	V	*1
2	Supply current	I_{CC}	1.2	A	—
3	Power dissipation	P_D	125.8	mW	*2
4	Operating ambient temperature	T_{opr}	-30 to +85	°C	*3
5	Storage temperature	T_{stg}	-55 to +125	°C	*3

Notes) *1: The values under the condition not exceeding the above absolute maximum ratings and the power dissipation.

*2: The power dissipation shown is the value at $T_a = 75^\circ\text{C}$ for the independent (unmounted) IC package.

When using this IC, refer to the P_D-T_a diagram of the package standard page 4 and use under the condition not exceeding the allowable value.

*3: Except for the operating ambient temperature, and storage temperature, all ratings are for $T_a = 25^\circ\text{C}$.

■ Operating supply voltage range

Parameter	Symbol	Range	Unit	Notes
Supply Voltage range	V_{CC}	3.0 to 5.5	V	*

Note) *: The values under the condition not exceeding the above absolute maximum ratings and the power dissipation.

■ Allowed Voltage Ranges

Note) • The ranges on the list are the voltages of respective pins in relation to GND.

• The VCCV represents the voltage of VCC Pin (Pin No. 8)

• Do not apply the voltages or the currents from external into the pins which are not on the list.

Pin No.	Pin name	Range	Unit	Notes
5	VOUT	-0.3 to (VCCV + 0.3)	V	*1
6	ENB	-0.3 to (VCCV + 0.3)	V	*1
7	NMOSG	-0.3 to (VCCV + 0.3)	V	*1
8	VCC	0 ~ 6.0	V	*1

Pin No.	Pin name	Range	Unit	Notes
13	MODE	-0.3 to (VCCV + 0.3)	V	*1
14	GND	0	V	*1
15	REF	-0.3 to (VCCV + 0.3)	V	*1
16	SENSE	-0.3 to (VCCV + 0.3)	V	*1

Note) *1 Valid for the input mode. Do not apply the voltages or the currents from external at output mode.

2. Timing Chart

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed.

1) Start and stop characteristics outline

A recommended sequence of start and stop operations is below.

For start-up, ENB must be changed "Low" to "High" after VCC voltage supplied.

The time of about 5 ms is necessary to stabilize VOUT.

Established	Revised	

<h1>Product Standards</h1>	<h2>AN30251A</h2>	
	Total Pages	Page
	21	17

■ Technical Data (Continued)

2. Timing Chart (Continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed.

2) Start up sequence of Flash Mode

After ENB is pulled-up to "High", the IC waits for 130 μ s to stabilize internal circuits.

After that, to avoid high inrush current during start-up, SSOUT restrict the duty of NMOSG pulse for 500 μ s.

SSOUT is changed discrete.

On Flash mode, The lowest value of IL is not equal to zero (Continues Conduction Mode).

	21	19

■ Technical Data (Continued)

2. Timing Chart (Continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed.

4) Short Circuit Protection (SCP)

This IC has a Short-Circuit Protection (SCP) in case the output pin is shorted to ground. SCP compares FB (ERAMP OUT) and VREF (1.25 V). SCP shuts down if the SENSE input is in the output load shorted state (ground shorted state) for a total of 250 ms (typical) or over. In this case, SCP stops almost all the circuits including OSC.

The ENB input signal must be reapplied to restart the IC operation.

2005-09-26	2005-10-31	
Established	Revised

		Total Pages	Page
		21	20

■ Technical Data (Continued)

2. Timing Chart (Continued)

Note) The characteristics listed below are reference values based on the IC design and are not guaranteed.

5) Over Detection Comparator (ODC)

When the output gets high impedance or disconnected, VOUT voltage rises. To prevent VOUT voltage exceeding the maximum switch voltage rating (20 V) of the external n-MOSFET, an Over Detection Comparator (ODC) is integrated. As soon as the output exceeds the ODC threshold (18.9 V), the converter stop switching and VOUT voltage falls down. When VOUT voltage falls below the ODC threshold (18.4 V), the converter restarts operation.

■ Usage Note

1. The following pin has an ESD withstand voltage of 2000 V to 3000 V (HBM actual value).
Pay utmost attention to handle this pin.
 VOUT (Pin No.5)
The other pins except VOUT have an ESD withstand voltage of 8000 V (HBM actual value)

2. Give sufficient consideration to the change of operating conditions including the constants of peripheral components.
Especially pay attentions to change the constants of Cin, Cout, L,R1,and R2 , because they have a influence on the phase characteristic.

3. Pin Short-circuiting
The IC will be destructed in the following cases.
 - The short-circuiting of the NMOSG (Pin No.7) pin with the power supply (VCC) pin.
Panasonic confirmed that there was no generation of smoke or fire with the pins short-circuited for 10 seconds after the destruction of IC.

4. A Fuse must be inserted to VCC line for safe. (Recommended Current Limit = 2 A)

5. Don't put any capacitances to MODE pin directory. Otherwise the current on Flash Mode is not stable.

4. Power Dissipation (Technical Report)

5. Power Dissipation (Supplementary Explanation)

[Experiment environment]

Power Dissipation (Technical Report) is a result in the experiment environment of SEMI standard conformity. (Ambient air temperature (Ta) is 25 degrees C)

[Supplementary information of PWB to be used for measurement]

The supplement of PWB information for Power Dissipation data (Technical Report) are shown below.

Indication	Total Layer	Resin Material
Glass-Epoxy	1-layer	FR-4
4-layer	4-layer	FR-4

[Notes about Power Dissipation (Thermal Resistance)]

Power Dissipation values (Thermal Resistance) depend on the conditions of the surroundings, such as specification of PWB and a mounting condition, and a ambient temperature. (Power Dissipation (Thermal Resistance) is not a fixed value.)

The Power Dissipation value (Technical Report) is the experiment result in specific conditions (evaluation environment of SEMI standard conformity), and keep in mind that Power Dissipation values (Thermal resistance) depend on circumference conditions and also change.

[Definition of each temperature and thermal resistance]

Ta : Ambient air temperature

※The temperature of the air is defined at the position where the convection, radiation, etc. don't affect the temperature value, and it's separated from the heating elements.

Tc : It's the temperature near the center of a package surface. The package surface is defined at the opposite side if the PWB.

Tj : Semiconductor element surface temperature (Junction temperature.)

Rth(j-c) : The thermal resistance (difference of temperature of per 1 Watts) between a semiconductor element junction part and the package surface

Rth(c-a) : The thermal resistance (difference of temperature of per 1 Watts) between the package surface and the ambient air

Rth(j-a) : The thermal resistance (difference of temperature of per 1 Watts) between a semiconductor element junction part and the ambient air

Fig1. Definition image

[Definition formula]

$$T_j = \{R_{th}(j-c) + R_{th}(c-a)\} \times P + T_a$$

$$= R_{th}(j-a) \times P + T_a$$

$$R_{th}(j-c) = \frac{T_j - T_c}{P} \quad (^\circ\text{C/W})$$

$$R_{th}(c-a) = \frac{T_c - T_a}{P} \quad (^\circ\text{C/W})$$

$$R_{th}(j-a) = \frac{T_j - T_a}{P} \quad (^\circ\text{C/W})$$

$$= R_{th}(j-c) + R_{th}(c-a)$$
