

# AS3711

## Quad Buck High Current PMIC with Charger

### General Description

The AS3711 is a compact System PMU with integrated battery charger and back light driver.

The device offers advanced power management functions. All necessary ICs and peripherals in a battery powered mobile device are supplied by the AS3711. It features 3 DCDC buck converters as well as 8 low noise LDOs. The different regulated supply voltages are programmable via the serial control interface. 4MHz operation with 1uH coils are reducing cost and PCB space.

AS3711 further features a DCDC buck controller which is ideal to support processor core currents up to 3A.

The two step-up converter generate voltages for e.g.the backlight, classD amplifier, USB host support or LCD display supply. Both constant voltage (for e.g. OLED supply) as well as constant current (white LED backlight) operations with three current sinks are possible. An internal voltage protection is limiting the output voltage in the case of external component failures.

AS3711 contains a linear or switching mode Li-Ion battery charger with constant current and constant voltage. The maximum charging current is 1.5A. An integrated battery switch and an optional external switch are separating the battery during charging or whenever an external power supply is present. With this switch it is also possible to operate with no or deeply discharged batteries. A programmable current limit (100mA - 2.5A) can be used to control the maximum current used from a USB supply or charger input. Additional features are a 30V OV protection and battery temperature supervision.

The single supply voltage may vary from 2.7V to 5.5V.

*[Ordering Information](#) and [Content Guide](#) appear at end of datasheet.*

## Key Benefits & Features

The benefits and features of AS3711, Quad Buck High Current PMIC with Charger are listed below:

**Figure 1:**  
**Added Value Of Using AS3711**

Benefits	Features
Compact design due to small coils for IO and memory voltage generation	<ul style="list-style-type: none"> <li>• 3 DCDC step down regulators (2-4MHz)</li> <li>- DVM (0.6V-3.3V; 1×1.2-1.5A, 2×0.7-1A)</li> <li>- 60µA quiescent current</li> <li>- 2A with combined DCDC 2 &amp; 3</li> </ul>
High current generation for processor core	<ul style="list-style-type: none"> <li>• DCDC step down controller</li> <li>- DVM (0.6V-3.3V; 2-3A)</li> </ul>
Supply multiple independent voltage rails for general IO supplies	<ul style="list-style-type: none"> <li>• 2 analog low noise LDOs, 6 digital LDOs</li> <li>- 2×1.2-3-3V, 6×0.9-3.3V; 150-300mA</li> <li>- 30µA quiescent current (low power mode)</li> <li>• 1 ultra low power always on LDO 2.5V, 10mA</li> </ul>
Backlight boost controller for multiple display configurations or fixed voltage supplies	<p><b>HV Backlight Driver</b></p> <ul style="list-style-type: none"> <li>• 2×step up with external transistor</li> <li>- e.g. 0.5-1A@5V; 40mA@50V</li> <li>• Voltage control mode and over-voltage protection</li> <li>• 3 programmable current sinks (max. 40mA)</li> <li>• Possible external PWM dimming input (DLS, CABC)</li> </ul>
Self contained free configurable charger with stand alone supervisory functions	<p><b>Battery Charger</b></p> <ul style="list-style-type: none"> <li>• Programmable trickle charging (25-220mA)</li> <li>• Programmable constant current charging (up to 1500mA)</li> <li>• Programmable constant voltage charging (3.9V-4.25V)</li> <li>• Charger time-out and temperature supervision</li> <li>• Selectable current limitation for USB mode</li> <li>• Integrated battery switch &amp; ideal diode (linear mode)</li> <li>• External battery switch control (switching mode)</li> <li>• External 30V OV protection</li> </ul>
Save supervision in HV which works also without a processor	<p><b>Supervisor</b></p> <ul style="list-style-type: none"> <li>• Automatic battery monitoring with interrupt generation and selectable warning level</li> <li>• Automatic temperature monitoring with interrupt generation and selectable warning and shutdown levels</li> </ul>
Very low current time keeping and alarm functions without the need of a processor	<p><b>Real Time Clock</b></p> <ul style="list-style-type: none"> <li>• Ultra low power 32kHz oscillator</li> <li>• Sec and minute counter, auto wake-up</li> <li>• Programmable alarm</li> <li>• Repeating alarm (seconds, minutes, 2 minutes, or 8 minutes)</li> <li>• 32kHz clock output to peripheral</li> <li>• &lt;1µA total power consumption</li> </ul>

Benefits	Features
Flexible multi-purpose IOs for general control or measurement tasks	<b>General Purpose IOs</b> <ul style="list-style-type: none"> <li>• 10-bit general purpose ADC input</li> <li>• Wake-up/sleep and DVM input</li> <li>• PWM (DLS, CABC) dimming input</li> <li>• Status output for: charger, low battery, power good and step-up over-current</li> <li>• Q32k clock output</li> <li>• Interrupt output</li> <li>• PWM output</li> <li>• Step-up feedback input</li> </ul>
Flexible and fast adaptations to different processors/applications.	<b>OTP programmable BOOT Sequence</b> <ul style="list-style-type: none"> <li>• Programmable regulator default voltages</li> <li>• Programmable start-up sequence</li> </ul>
Enables the processor to check the system state in detail	<b>General Purpose ADC</b> <ul style="list-style-type: none"> <li>• 10-bit resolution</li> <li>• Several internal / external sources <ul style="list-style-type: none"> <li>- VUSB, VSUP, CHGIN, VBAT</li> <li>- GPIOx, CURRx</li> <li>- XOUT32K, SENSEN_SU1, LX_SD4</li> <li>- Chip temperature</li> </ul> </li> </ul>
Easy control of all PMIC functions, Safety shutdown feature, without reset button.	<b>Control Interface</b> <ul style="list-style-type: none"> <li>• I<sup>2</sup>C control lines, including watchdog</li> <li>• ON input with 4/8s emergency shut-down</li> <li>• Bidirectional reset, with selectable delay</li> <li>• Ultra low power standby mode</li> </ul>
No need for external POR or supervisory	<b>Power-On Reset Circuit</b>
Dedicated packages for specific applications. Optimization for PCB cost or size.	<b>Packaging</b> <ul style="list-style-type: none"> <li>• QFN56 7×7mm 0.4mm pitch</li> <li>• CSP64 3.6×3.5mm 0.4mm pitch</li> </ul>

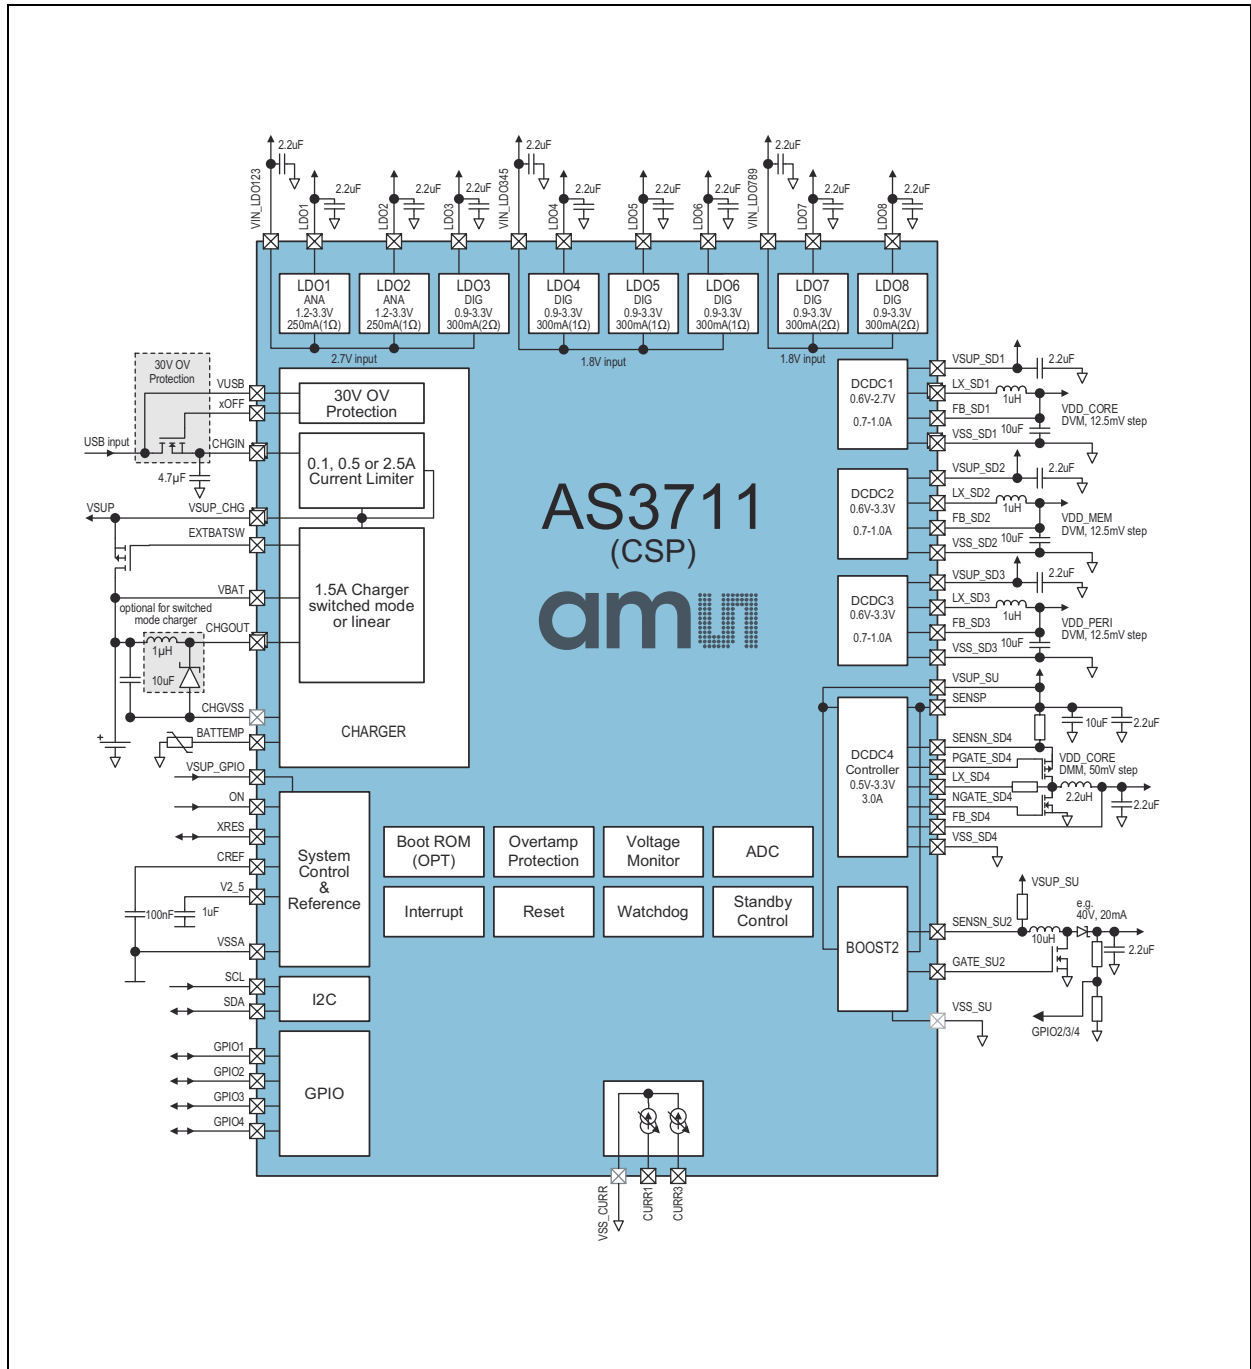

## Applications

The AS3711, Quad Buck High Current PMIC with Charger, is suitable for Portable Media Players, Portable Navigation Devices, E-Books, Mobile Internet Devices, and Tablet PCs.

## Absolute Maximum Ratings

Stresses beyond those listed in [Absolute Maximum Ratings](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Figure 7:**  
Absolute Maximum Ratings

## Typical Operating Characteristics

Please see operating characteristics in the block description chapters.

## Detailed Description - Power Management Functions

### DCDC Step-Down Converter

#### Description

The step-down converter is a high efficiency fixed frequency current mode regulator. By using low resistance internal PMOS and NMOS switches efficiency up to 95% can be achieved. The fast switching frequency allows using small inductors, without increasing the current ripple. The unique feedback and regulation circuit guarantees optimum load and line regulation over the whole output voltage range, up to an output current of 1A (SD2, SD3) and 1.5A for SD1, with an output capacitor of only 10 $\mu$ F. The implemented current limitation protects the DCDC and the coil during overload condition.

**Figure 9:**  
Step Down DC/DC Converter Block diagram

## Mode Settings

### Low ripple, low noise operation:

Bit settings: sdX\_low\_noise=1

In this mode there is no minimum coil current necessary before switching OFF the PMOS. As long as the load current is superior to the ripple current the device operates in continuous mode. When the load current gets lower, the discontinuous mode is triggered. As result, the auto-zero comparator stops the NMOS conduction to avoid load discharger and the duty cycle is reduced down to tmin\_on to keep the regulation loop stable. This results in a very low ripple and noise, but decreased efficiency, at light loads, especially at low input to output voltage differences.

Only in the case the load current gets so small that less than the minimum ON-time of the PMOS would be needed to keep the loop in regulation the regulator will enter low power mode operation. The crossover point is about 15mA for Vin=3V, Vout=1.2V, 1uH, 4MHz.

**Figure 10:**  
DCDC Buck with enabled Low Noise Mode

### High efficiency operation (default setting):

Bit settings: sdX\_low\_noise=0

In this mode there is a minimum coil current necessary before switching OFF the PMOS. As a result there are less pulses necessary at low output loads, and therefore the efficiency at low output load is increased. As drawback this mode increases the ripple up to a higher output currents.

The crossover point to low power mode is already reached at reasonable high output currents. (e.g. @110mA for  $V_{in}=3V$ ,  $V_{out}=1.2V$ ,  $1\mu H$ ,  $4MHz$ )

**Figure 11:**  
**DCDC Buck with disabled Low Noise Mode**

It's possible to switch between these two modes during operation:

***Low power mode operation (automatically controlled):***

As soon as the output voltage stays above the desired target value for a certain time, some internal blocks will be powered down leaving the output floating to lower the power consumption. Normal operation starts as soon as the output drops below the target value for a similar amount of time. To minimize the accuracy error some internal circuits are kept powered to assure a minimized output voltage ripple.

Two additional guard bands, based on comparators, are set at  $\pm 5\%$  of the target value to react quickly on large over/undershoots by immediately turning on the output drivers without the normal time delays. This ensures a minimized ripple also in very extreme load conditions.

***DVM (Dynamic Voltage Management)***

To minimize the over-/undershoot during a change of the output voltage, the DVM can be enabled. With DVM the output voltage will ramp up/down with a selectable slope after the new value was written to the registers. Without DVM the slew rate of the output voltage is only determined by external components like the coil and load capacitor as well as the load current.

DVM can be selected for all step-down converters, but only for one at a time. (see [sd\\_dvm\\_select](#) and [dvm\\_time](#) description)

***Fast Regulation Mode***

This mode can be used to react faster on sudden load changes and thus minimize the over-/undershoot of the output voltage. This mode needs an 22uF output capacitor instead the 10uF one to guarantee the stability of the regulator. The mode is enabled by setting `sdX_fast = 1`.

***Selectable Frequency Operation***

Especially for very low load conditions, e.g. during a sleep mode of a processor, the switching frequency can be reduced to achieve a higher efficiency. The frequency for SD1, SD2 and SD3 can be set to 2, 3 or 4MHz. This mode is selected by setting `sdX_freq` and `sdX_fsel` to the appropriate values.

***100% PMOS ON Mode for Low Dropout Regulation***

For low input to output voltage difference the DCDC converter can use 100% duty cycle for the PMOS transistor, which is then in LDO mode.

***Step-Down Converter Configuration Modes***

The step down DCDC converters have two configuration modes to deliver different output currents for the applications. The operating mode is selected by setting the bit `sd3_slave` (the default is set by the Boot-OTP).

**Figure 12:**  
**DC/DC step-down SD1, SD2, SD3 Normal Operating Mode; `sd3_slave = 0`**

**Figure 13:**  
**DC/DC step-down SD1, SD2, SD3 2A Operating Mode; `sd3_slave = 1`**

### Parameter

**Figure 14:**  
Step Down DC/DC Converter Parameters

Symbol	Parameter	Note	Min	Typ	Max	Unit
$V_{IN}$	Input voltage	Pin VSUP_SDx	2.7		5.5	V

### DCDC Step-Down Controller

#### Description

The Step-Down controller SD4 uses a paired external NMOS, PMOS to achieve higher output currents. the maximum output current is determined by the external transistor and shunt used.

**Figure 20:**  
**DC/DC step-down Controller**

## Analog LDO Regulators

### Description

LDO1 and LDO2 are designed to supply sensitive analogue circuits like LNA's, Transceivers, VCO's and other critical RF components of cellular radios. Another application is the supply of audio devices or as a reference for AD and DA converters. The design is optimized to deliver the best compromise between quiescent current and regulator performance for battery powered devices.

Stability is guaranteed with ceramic output capacitors of  $1\mu\text{F} \pm 20\%$  (X5R) or  $2.2\mu\text{F} +100/-50\%$  (Z5U). The low ESR of these caps ensures low output impedance at high frequencies. Regulation performance is excellent even under low dropout conditions, when the power transistor has to operate in linear mode. Power supply rejection is high enough to suppress the PA-ripple on the battery in TDMA systems at the output. The low noise performance allows direct connection of noise sensitive circuits without additional filtering networks. The low impedance of the power device enables the device to deliver up to IO<sub>UT</sub> current even at nearly discharged batteries without any decrease of performance.

The default guaranteed operating current during start-up is 150mA, but can be set to 250mA with `ldoX_imit = 1`.

To save power in low-power states where the full performance is not needed the bias current can be reduce by setting `reg_low_bias_mode=1`.

## Digital LDO Regulators

### Description

Digital LDOs offer a wide input (1.8V to 5.5V) as well as a wide output (0.9 to 3.3V) voltage range to be used for general purpose peripheral supply. Up to 300mA possible output currents are offered with good noise and regulation performance and very low quiescent current even suitable for stand-by power supply.

## Low power LDO V2\_5 Regulators

### Description

The low power LDO V2\_5 is needed to supply the chip core (analog and digital) of the device. It is designed to get the lowest possible power consumption, and still offering reasonable regulation characteristics. The regulator has two supply inputs selecting automatically the higher one. This gives the possibility to supply the chip core either with the battery or with the charger depending on the conditions. Bulk switch comparators are used to avoid any parasitic current flow. To ensure high PSRR and stability, a low-ESR ceramic capacitor of min. 1 $\mu$ F must be connected to the output.

### Parameter

**Figure 29:**  
**Low power LDO (V2\_5) Characteristics,  $V_{BAT}=3.7V$ ;  $I_{LOAD\_ext}=0$ ;  $T_{amb}=25^{\circ}C$ ;  $C_{LOAD} = 1\mu F$  (Ceramic); unless otherwise specified**

### DCDC Step-Up Converter

#### Description

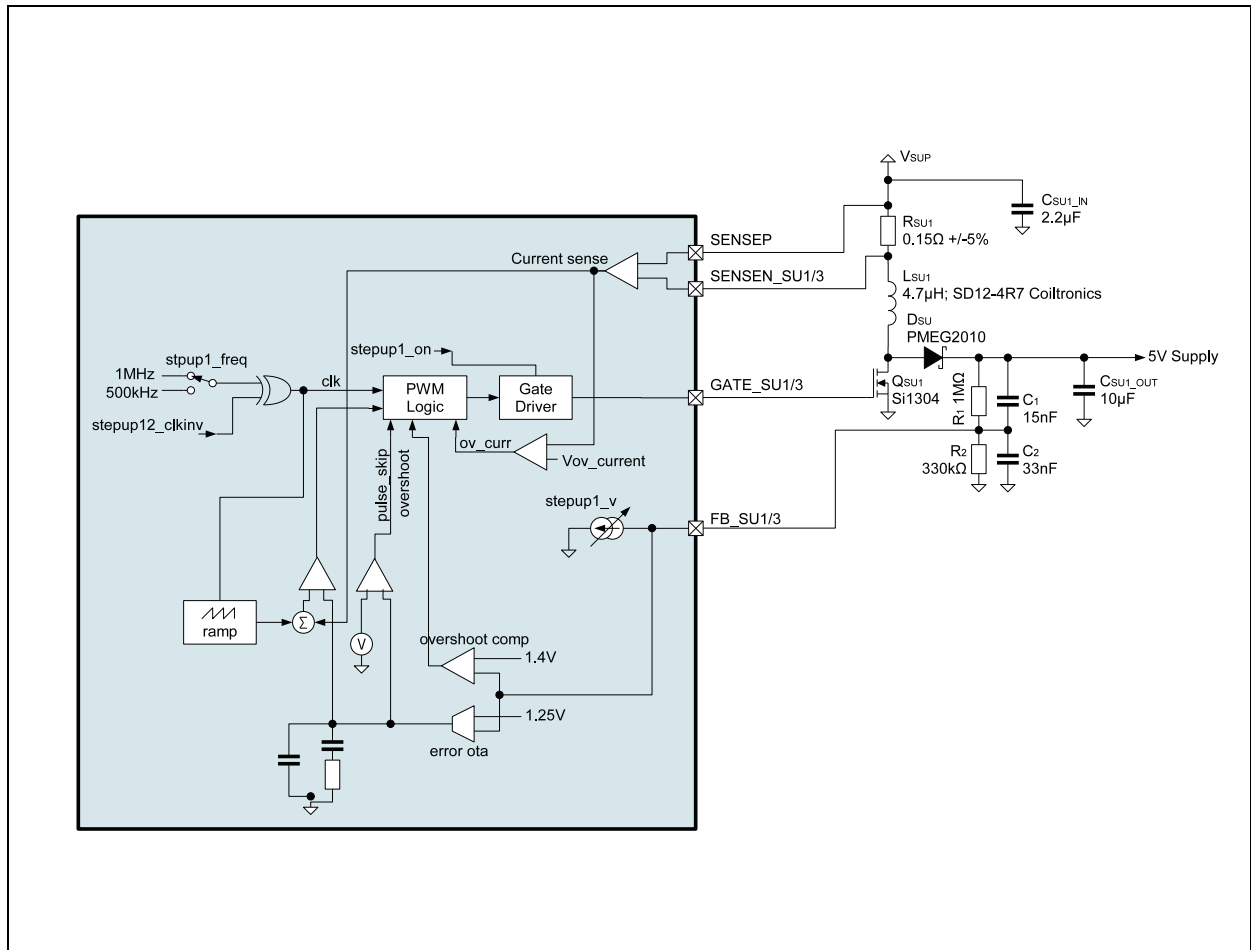

The DC/DC Step Up converter is a high efficiency current mode PWM regulator, which provides an output voltage dependent on the maximum VDS voltage of the external transistor, and maximum load current selectable by the external shunt resistor.

For Example:

- 5V, 0.5-1A @ 1Mhz
- 25V, 50mA @ 1MHz
- 40V, 20mA @ 500kHz

A constant switching frequency results in a low noise on supply and output voltage. Step-up converter 1 is not available in CSP64 package.

Figure 30:  
DC/DC step-up Converter 1

**Figure 31:**  
**DC/DC step-up Converter 2**

**Feedback selection SU1**

For step up SU1, the feedback is always FB\_SU1.

**Feedback Selection SU2**

For step up SU2 following feedback selections are possible (selected by `stepup2_fb`): (see Figure 31)

**Current Feedback**

CURR1, CURR2 or CURR3 can be selected by `stepup2_fb` as a current feedback pin.

The step-up converter is regulated such that the required current at the feedback path can be supported. `stepup2_fbprot` selects the overvoltage protection feedback pin (LX\_SD4, GPIO2, GPIO3 or GPIO4). In this mode the output voltage will be limited by limiting the voltage on the selected feedback pin to 1.25V (select the external resistor network and `stepup2_v` to adjust this limitation voltage).

`stepup2_prot_dis` has to be set to 0, otherwise the protection is disabled.

Always choose the path with the higher voltage drop as feedback to guarantee adequate supply for the other, unregulated path.

**Current Feedback with Automatic Feedback Selection**

Same as above, but when `currX_ctrl` = 10b for the used current sinks, the chip automatically selects the highest string (CURR1, CURR2 or CURR3) as feedback input.

**Voltage Feedback**

`stepup2_fb` = 00b. LX\_SD4, GPIO2, GPIO3 or GPIO4 can be selected by `stepup2_fbprot` as a voltage feedback input.

The step-up converter output voltage is regulated by regulating the selected feedback pin voltage to 1.25V.

**Calculating Resistors for Voltage Feedback or Over-Voltage Protection**

Bit `stepupX_res` should be set to 1 in voltage feedback mode using two resistors.

The output voltage is regulated to a constant value, given by:

$$(EQ1) \quad V_{SU} = \frac{R_1 + R_2}{R_3} \times 1,25 + I_{FB} \times R_1$$

If R2 is not used, the output voltage is:

$$(EQ2) \quad V_{SU} = 1,25 + I_{FB} \times R_1$$

$V_{SU}$ : Step up regulator output voltage

$R_1$  : Feedback resistor R1

$R_2$  : Feedback resistor R2

$I_{FB}$ : Tuning current on DCDC\_FB pin: `stepupX_v` (0 to 31 $\mu$ A (1 $\mu$ A steps))

**Example:****Figure 32:**  
**Step Up Output Voltage (Voltage mode or protection voltage)**

$I_{FB}$ (stepupX_v)	$V_{SU}$	$V_{SU}$
$\mu A$	R1=1M $\Omega$ , R2 not used	R1=500k $\Omega$ , R2=64k $\Omega$
0	-	11
1	-	11.5
2	-	12
3	-	12.5
4	-	13
5	6.25	13.5
6	7.25	14
7	8.25	14.5
8	9.25	15
9	10.25	15.5
10	11.25	16
11	12.25	16.5
12	13.25	17
13	14.25	17.5
14	15.25	18
15	16.25	18.5

**Note(s) and/or Footnote(s):**

1. The voltage on pin CURR1, CURR2 and CURR3 must never exceed 30V.

**Output Disconnect**

As the output voltage is always ON, an additional output transistor can be added to reduce shutdown current through R1, R2 and the connected output circuit.

**Note(s):** A similar circuit can be used for step up converter 2.

**Figure 34:**  
**StepUp 1 Load Detection and Over-current Protection Application Circuit**

### Parameter

## Current Sinks

### Description

These are general-purpose current sinks intended to control the backlight(s), buzzer and vibrator.

CURR1 and CURR2, CURR3 are high voltage (30V) current sinks, e.g. for series of white LEDs. CURR2 is not available in CSP package.

Current sinks CURR1, CURR2 and CURR3 can be controlled individually. The step-up DCDC converter (SU2) may supply them with voltages up to 30V. For an automatic feedback selection the used current sinks can be assigned to the SU2 booster.

If not used as a current sink, CURR3 can be used to output several status signals. In this mode the CURR3 output acts like an open-drain output and needs an external pull-up resistor for generating logic high levels.

### Parameter

**Figure 39:**  
Current Sinks Characteristics

Symbol	Parameter	Note	Min	Typ	Max	Unit
$I_{\text{CURR1,2,3}}$	CURR1,2 & 3 current, 00h-3Fh	For $V(\text{CURRx}) > 0.5\text{V}$ resolution = 0.1563mA	0		39.84	mA

$V_{\text{CURR1,2,3}}$	Voltage compliance	During normal operation	0.5		30	V

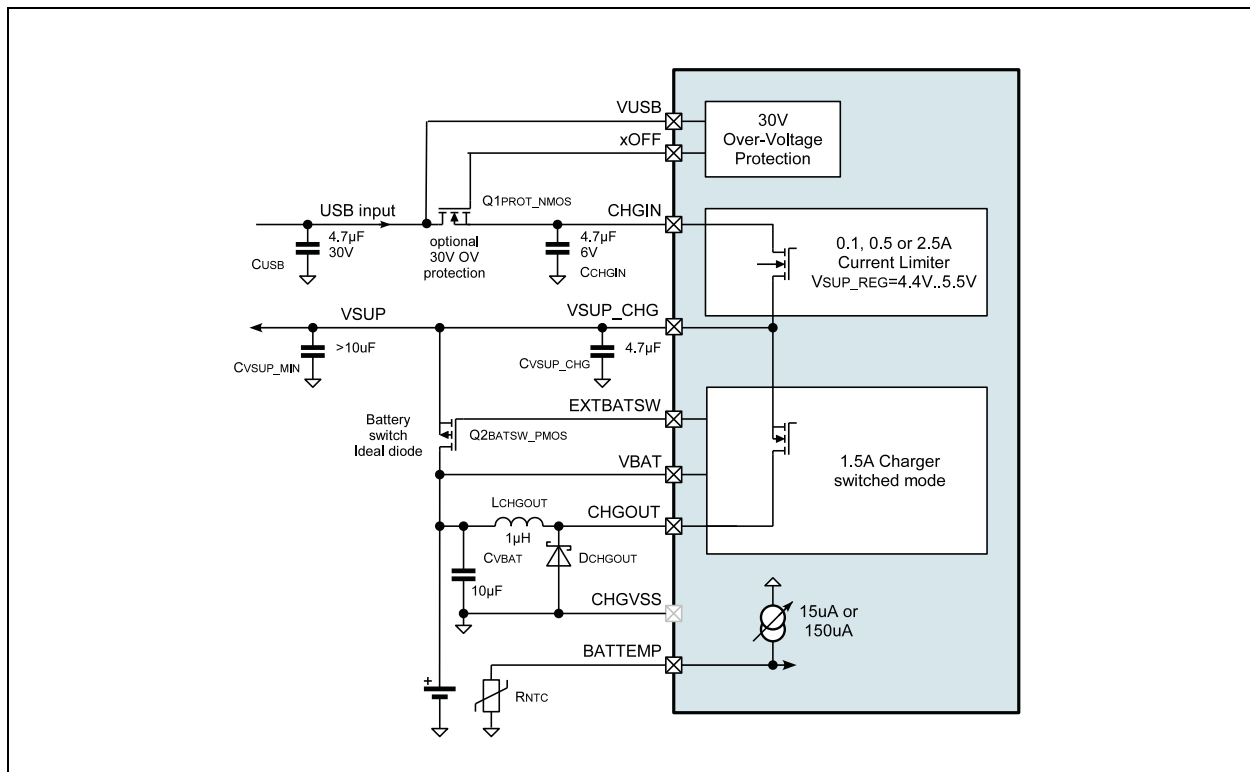

## Charger

### Description

The AS3711 device serves as a standalone battery charge controller supporting rechargeable lithium Ion (Li+) batteries. Requiring only a few external components, a full-featured battery charger with a high degree of flexibility can easily be realized. The main features of the controller are:

- Charge adapter detection
- PowerPath management & internal voltage regulator (V2\_5), for dead battery startup
- Low current (soft) charging
- Low current (trickle) charging
- Constant current charging
- Constant voltage charging
- 30V Overvoltage protection
- Battery presence indication
- Operation without battery
- Input current limitation
- Input voltage drop regulation
- Programmable linear or switched mode operation
- Bypass mode for high input current application (up to 6A)

**Figure 40:**  
Charger Application Block Diagram, Step Down Charger Mode

**Figure 41:**  
**Charger Application Block Diagram, Linear Charger Mode**

## Charging Cycle Description

### Charge adapter detection

The charge controller uses an integrated detection circuit to determine if an external charge adapter has been applied to the VUSB pin. If the adapter voltage exceeds the battery voltage at pin VBAT by  $V_{CHDET}$  the *ChDet* bit in the *ChargerStatus* register will be set. The detection circuit will reset the charge controller (bit *ChDet* is cleared) as soon as the voltage at the VUSB pin drops to only  $V_{CHMIN}$  above the battery voltage. In case the AS3710AS3711 device is reset the charge controller will also be reset, even if a charge adapter is applied to the VUSB pin.

### Soft charging

Soft charge mode is started when an external charge adapter has been detected, the *bat\_charging\_enable* is set and the battery voltage at pin VBAT is below the  $V_{SOFT}$  threshold.

### Low current (trickle) charging

Trickle charge mode is started when an external charge adapter has been detected *bat\_charging\_enable* is set and the battery voltage at pin VBAT is below the  $V_{TRICKLE}$  threshold and above  $V_{SOFT}$  threshold; bits *ChDet* and *Trickle* will be set in the *ChargerStatus* register. In this mode the charge current will be limited to *TrickleCurrent* (set in the *ChargerCurrent* register) to

prevent undue stress in case of deeply discharged batteries. Once  $V_{\text{TRICKLE}}$  has been exceeded, the charger will change over to constant current charging (**Trickle** is cleared).

#### **Constant current charging**

Constant current charging is initiated when *bat\_charging\_enable* is set and the battery voltage at pin VBAT is above the  $V_{\text{TRICKLE}}$  and below  $V_{\text{CHOFF}}$ . The **CCM** bit is set when the charger has started, and the charge current will be limited to **ConstantCurrent** by the battery charge controller. When the battery approaches full charge, its voltage will reach the charge termination threshold  $V_{\text{CHOFF}}$ .  $V_{\text{CHOFF}}$  depends on the **ChVoltEOC** bits settings. Top-off charge will be started (**CVM** will be set).

#### **Constant voltage charging**

Constant voltage charge mode is initiated and the **CVM** bit will be set when the  $V_{\text{CHOFF}}$  threshold has been reached.

The charge current is monitored during constant voltage charging. It will be decreasing from its initial value during constant current charging and eventually drop below the value set by **TrickleCurrent**. If the measured charge current is less than or equal to **TrickleCurrent**, the charging cycle is terminated and **EOC** is set.

### Charger States

Figure 42:  
Charger States Diagram

### Stop charging conditions

There are multiple safety features implemented that trigger a stop\_charging condition:

These are the following:

- Battery temperature too high. If  $ntc\_on=1$  and voltage at pin NTC is below  $V_{BATTEMP}$
- Timeout timer expired (If  $ch\_timeout>0$  and charging time has been exceeded. (Can be reset by unplugging the charger, setting  $chg\_on=0$  or writing  $charging\_tmax=0$ )
- VUSB over-voltage detected
- Die temp>140deg (ov\_temp\_140 set)

### **Battery presence indication and operation without battery**

After EOC state is reached a timer for NOBAT detection is started. If there is no battery present, the VBAT voltage will drop to  $V_{RESUME}$ . Depending on the load on VBAT and the capacitor on VBAT this might take some milliseconds to 1 second. If the RESUME mode is enabled (Bit `auto_resume=1`), the charger will restart charging (ConstantCurrent charging) after 100msec delay.

The 100msec dead time is necessary to get a battery oscillation frequency below 10Hz, if there is no battery present.

If the NOBAT detection timer is below 2 seconds after reaching EOC state, and this happens 2 times in serial, the `Nobat` bit in ChargerStatus register is set. If an battery is inserted the bit will be reset after the timer exceeds the 2 seconds.

In addition, if the `nobat_ntc_det` bit is set the looping will be stopped and a NTC detection is started.

A pull up current of 0.5uA is applied to BATTEMP. If the BATTEMP voltage is above 1.8V, the state machine stays in the no bat state. If the BATTEMP voltage is below 1.8V, a charging cycle is initiated.

### **Charger overvoltage protection**

This blocks checks if the charger voltage VUSB is above  $V_{CHOVH}$ . If the VUSB voltage is above  $V_{CHOVH}$ , the pin XOFF is pulled to GND immediately, to protect the pin VCHG\_IN, and the charger is set into OFF state. If the VUSB voltage is below  $V_{CHOVH}$  the XOFF pin is charged up to  $V_{XOFF\_REG}$  with an integrated charge pump. If the pin exceeds  $V_{XOFF\_MIN}$  the `usb_prot_ready` bit is set and the charger is started.

### **NTC supervision**

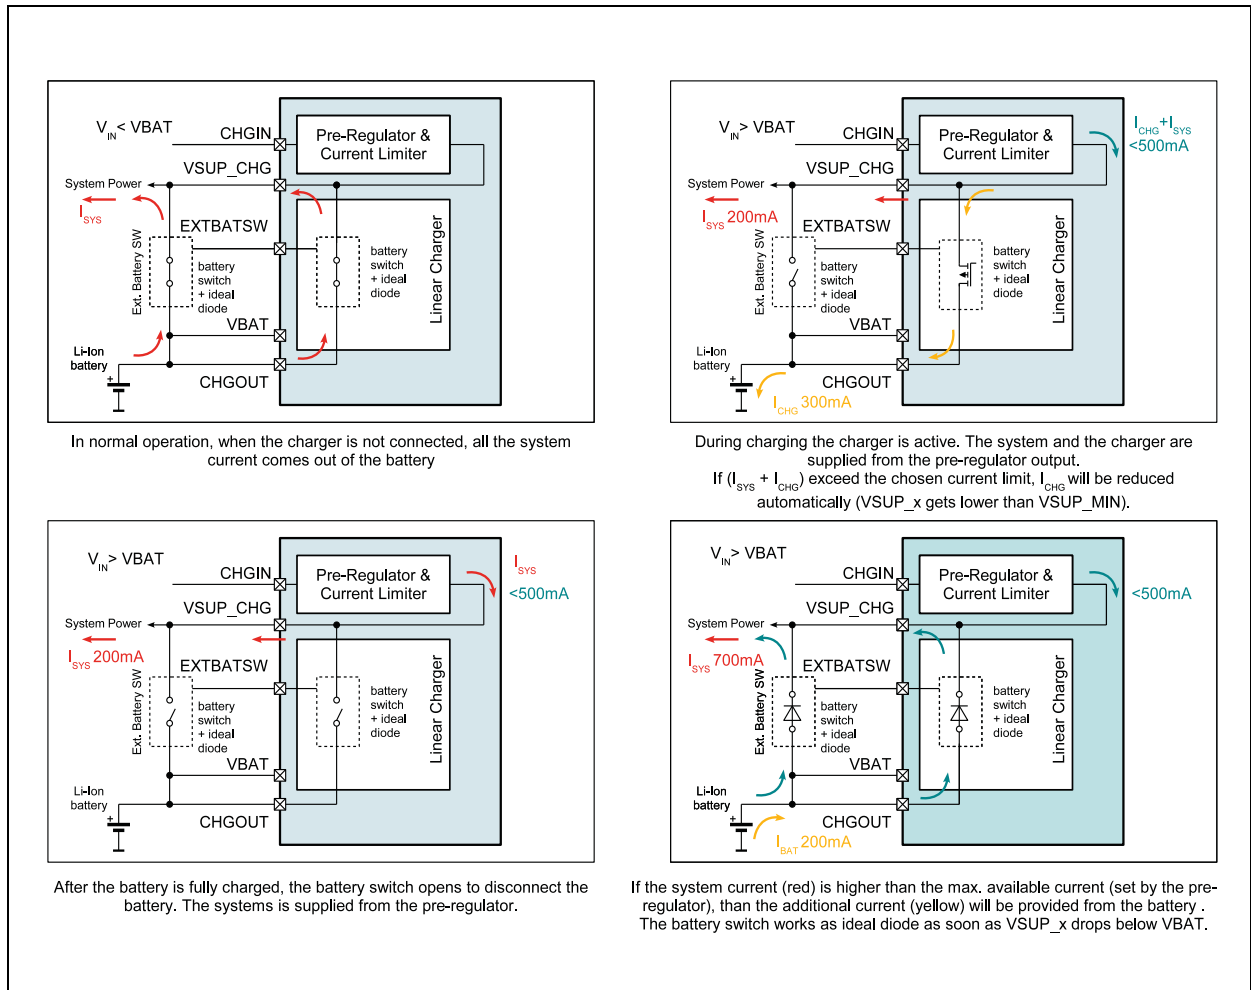

This charger block also features a supply for an external NTC resistor to measure the battery temperature while charging. If the temperature is too high (voltage on BATTEMP pin is below  $V_{BATTEMP\_ON}$ ) the charger will stop operation. If needed an interrupt can be generated based on this event. When the battery temperature drops the voltage on BATTEMP pin will rise above  $V_{BATTEMP\_OFF}$  and the charger will start charging again. This is forming a temperature hysteresis of about 3 to 5°C to avoid an oscillation of the charger.

The levels for switching OFF the charger (`ntc_temp`: 45°C or 55°C) as well as the type of NTC (`ntc_10k`: 10k or 100k) can be selected via register settings. The battery temperature supervision via the NTC can be switched OFF (`ntc_on = 0`).

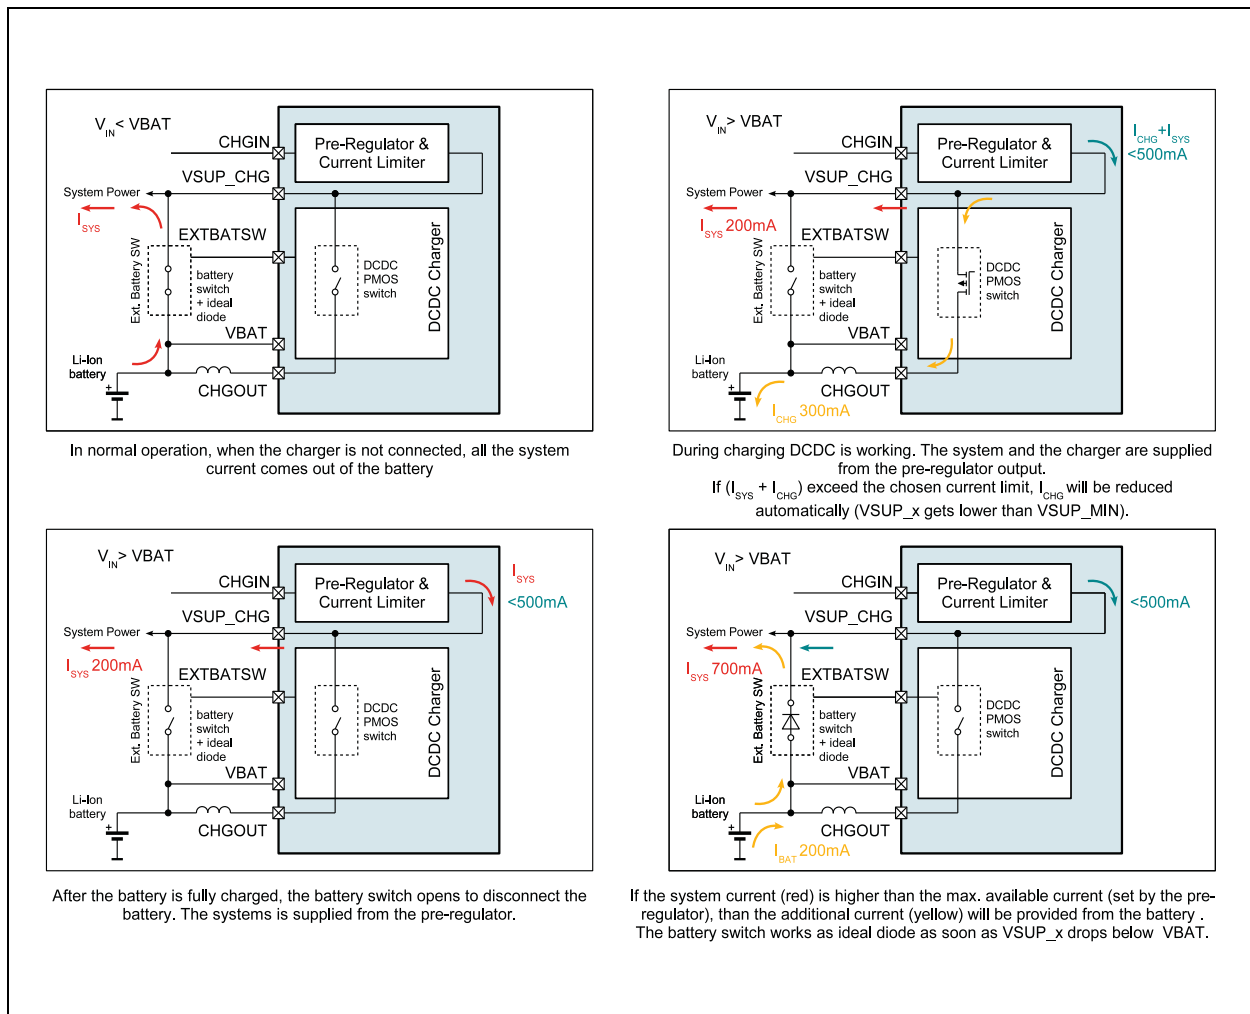

The supply for the NTC will be only on when a charger is detected and `ntc_on` bit is set.

# Detailed Description - System Functions

## Start-up

Figure 50:  
Startup Flow Chart

### Normal Startup

During a normal reset cycle (e.g. after the battery or a charger is inserted), after  $V_{2\_5}$  is above  $V_{POR}$  and  $V_{SUP}$  is above  $ResVoltRise$  a normal startup happens:

- The external capacitor on  $C_{REF}$  is charged to 1.8V.
- Configuration of Charger (DCDC or linear) and  $SD2/SD3$  (combined mode or separated) is read from the Boot-OTP.
- Startup State machine reads out the internal Boot-OTP. The start-up sequence of Step-Down Converter, LDO's and GPIOs are controlled by the Boot-OTP.
- Reset-Timer is set by the Boot-OTP
- The reset is released when the Reset Timer expires (external pin XRES)

### Startup from Charger

If the voltage on pin  $V_{USB}$  is within  $V_{START\_CHARGER}$ , the AS3711 is started (even with  $V_{BAT} = 0V$ ). This allows the battery to be charged (even from deeply discharged batteries) and finally a normal startup to happen.

### Parameter

**Figure 51:**  
Charger and ON-input Startup Conditions

Symbol	Parameter	Note	Min	Typ	Max	Unit
$V_{START\_CHARGER}$	Voltage on $V_{USB}$ for system to start	on Pin $V_{USB}$	4.2	5.0	30	V
$V_{ON\_IL}$	ON Low Level input voltage		-0.3		0.4	V
$V_{ON\_IH}$	ON High Level input		1.4		$V_{VSUP\_GPIO}$	V
$I_{ON\_PD}$	ON Pull down current		4	12		$\mu A$

## Reset

### Description

XRES is a low active bi-directional pin. An external pull-up to the periphery supply has to be added.

During each reset cycle the following states are controlled by the AS3711:

- Pin XRES is forced to GND
- Normal startup with programmable power ON sequence and regulator voltages (see [Start-up on page 52](#))
- Reset is active until the programmable reset timer (set by register bits *res\_timer*<2:0>) expires
- All registers are set to their default values after power ON, except the reset control- and status-registers.
- XRES is pulled high by the external resistor and the whole system is leaving the reset state

**Note(s):** Programming is controlled by the internal Boot-OTP.

### Parameter

**Figure 52:**  
XRES-input Characteristics

Symbol	Parameter	Note	Min	Typ	Max	Unit
$V_{XRES\_IL}$	XRES Low Level input voltage		-0.3		0.4	V
$V_{XRES\_IH}$	XRES High Level input voltage		1.4		VSUP_ GPIO	V

### Reset Conditions

Reset can be activated from 7 different sources:

- Power ON (battery or charger insertion)
- Low Battery
- Software forced reset
- Power OFF mode
- External triggered through the pin XRES
- Over-temperature
- Watchdog
- On-key long press

**Voltage Detection:**

There are two types of voltage dependent resets:  $V_{POR}$  and  $V_{XRES}$ .  $V_{POR}$  monitors the voltage on V2\_5 and  $V_{XRES}$  monitors the voltage on VSUP. The linear regulator for V2\_5 is always ON and uses the voltage CHGIN or VBAT VSUP as its source.

The pin XRES is only released if V2\_5 is above  $V_{POR}$  and VSUP is above ResVotIRise.

**Figure 53:**  
**Reset Levels**

Symbol	Parameter	Note	Min	Typ	Max	Unit
$V_{POR}$	Overall power ON reset	Monitor voltage on V2_5; power ON reset for all internal functions	1.5	2.0	2.3	V
$VRES_{RISE}$	Reset level for Vsupply rising	Monitor voltage on VSUP; rising level		ResVolt Rise <sup>(1)</sup>		V
$VRES_{FALLING}$	Reset level for Vsupply falling	Monitor voltage on VSUP; falling level		2.7		V
		If $SupResEn=1$ only		ResVolt Fall		V
$VRES_{MASK}$	Mask time for $VRES_{FALLING}$ . Duration for $V_{BAT} < ResVoltFall$ until a reset cycle is started <sup>(2)</sup>	$FastResEn = 0$		3		ms
		$FastResEn = 1$		4		us

**Note(s) and/or Footnote(s):**

1. It's recommended to set the ResVoltRise level 200mV above the ResVolt Fall level to have a hysteresis.
2. XRES signal is de-bounced with the specified mask time for rising- and falling slope of  $V_{BAT}$ .
3.  $VRES_{FALLING}$  is only accepted if the reset condition is longer than  $VRES_{MASK}$ . This guard time is used to avoid a complete reset of the system in case of short drops of  $V_{BAT}$ .

**Power OFF:**

To put the chip into ultra low power mode, write '1' into *power\_off*. The chip stays in power OFF mode until the external pin ON is pulled high, the charger is inserted or the level  $V_{POR}$  is touched to start a complete reset cycle. The bit *power\_off* is automatically cleared by this reset cycle. During *power\_off* state all circuits are shut-off except the Low Power LDO (V2\_5). Thus the current consumption of AS3711 is reduced to less than 15 $\mu$ A. The digital part is supplied by V2\_5, all other circuits are turned OFF in this mode, including references and oscillator. Except the reset control registers all other registers are set to their default value after power ON.

**Software forced reset**

Writing '1' into the register bit *force\_reset* immediately starts a reset cycle. The bit *force\_reset* is automatically cleared by this reset.

**External triggered reset:**

If the pin XRES is pulled from high to low by an external source (e.g. microprocessor or button) a reset cycle is started as well.

**Over-temperature reset:**

The reset cycle can be started by over-temperature conditions. (see [Supervisor on page 63](#))

**Watchdog reset:**

If the watchdog is armed (register bit [wtdg\\_on](#) = 1 and [wtdg\\_res\\_on](#) = 1) and the timer expires it causes a reset. (see [Watchdog on page 64](#)).

**Long ON-key press:**

When applying a high level on the ON input pin for 4s/8s (depending on [on\\_reset\\_delay](#)) a reset is initiated. This is thought as a safety feature when the SW hangs up and no watchdog is used.

## Stand-by

### Description

Stand-by allows shutting down a part or the complete system. Stand-by can be terminated by every possible interrupt or GPIO of the PMU. The interrupt has to be enabled and GPIO has to be configured before going to hibernation.

**Figure 54:**  
Hibernation

State	Description
Enter via GPIO	<p>To enter stand-by mode the following settings have to be done:</p> <ul style="list-style-type: none"> <li>• Enable just these IRQ sources which should lead to leave hibernation mode.</li> <li>• Make sure that IRQ is inactive (IRQ flags get cleared by register reading)</li> <li>• Set the GPIO to input (gpioX_mode = 0) -Set the GPIO for stand-by control (gpioX_iosf = 6)</li> <li>• Set regX_select and regX_voltage if another voltage is needed during stand-by for up to 3 regulators</li> <li>• Define which regulators should be kept powered during stand-by (sdX_stby_on, ldoX_stby_on)</li> <li>• Set <a href="#">chg_pwr_off_en</a> to 1</li> <li>• Activate the selected GPIO (going HIGH)</li> </ul>
Enter via SW	<p>To enter stand-by mode the following settings have to be done:</p> <ul style="list-style-type: none"> <li>• Enable just these IRQ sources which should lead to leave hibernation mode.</li> <li>• Make sure that IRQ is inactive (IRQ flags get cleared by register reading)</li> <li>• Set the delay for going into stand-by after the SW command (<a href="#">off_delay</a>)</li> <li>• Define which regulators should be kept powered during stand-by (sdX_stby_on, ldoX_stby_on)</li> <li>• Set <a href="#">chg_pwr_off_en</a> to 1</li> <li>• Set <a href="#">standby_mode_on</a> to 1</li> </ul>

### Internal References

The internal reference circuits needs the following external components:

**Figure 55:**  
Reference External Components

Symbol	Parameter	Note	Min	Typ	Max	Unit
C <sub>EXT</sub>	External filter capacitor	Ceramic low-ESR capacitor between CREF and VSS	-10%	100	+10%	nF

#### Low Power Mode

Use bit **low\_power\_on** to activate the Low Power Mode. In this mode the on-chip voltage reference and the temperature supervision comparators are operating in pulsed mode. This reduces the quiescent current of the AS3711 by 45uA (typ.). Because of the pulsed function some specifications are not fulfilled in this mode (e.g. increased noise), but still the full functionality is available.

**Note(s):** Low power mode can be controlled by the serial interface.

#### Parameter

**Figure 56:**  
References Parameters

Symbol	Parameter	Note	Min	Typ	Max	Unit
V <sub>CEXT</sub>	Reference Voltage	Low noise trimmed voltage reference – connected to Pad CREF; <b>do not load</b>	-1%	1.8	+1%	V
f <sub>CLK</sub>	Accuracy of Internal reference clock	Adjustable by serial interface register clk_int	-12	f <sub>CLK</sub>	+12	%

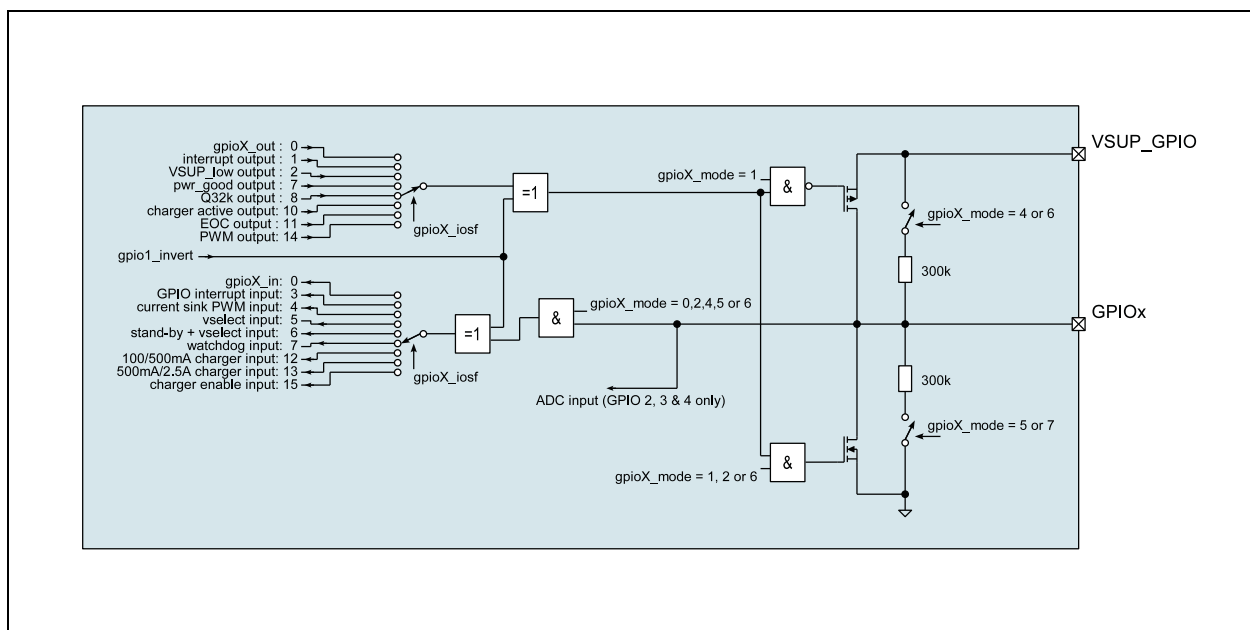

## GPIO Pins

### Description

The device contains 4 GPIO pins. Each of the pins can be configured as digital input, digital input (with pull-up or pull-down), ADC input (tri-state, or with pull down) only for GPIO2,3 and 4, push-pull output, or open drain output (with or without pull-up). When configured as output the output source can be a register bit, or the PWM generator.

The polarity of the input and output signals can be inverted with the corresponding `gpioX_invert` bit, all further descriptions refer to normal (noninverted) mode.

**Figure 57:**  
GPIO Block Diagram

### IO Functions

#### Normal IO operation:

If set to input, the logic level of the signal present at the GPIOx pin can be read from `gpioX_in`. If the output mode is chosen, `gpioX_out` specifies the logic level of the GPIOx pin.

This mode is also used for the ON/OFF control of the DCDC and LDOs. The selection which regulator is controlled by which GPIO is done with the `gpio_ctrl_sdX` or `gpio_ctrl_Idx` bits.

The `gpioX_mode` should be set to input.

#### Interrupt output:

GPIOx pin logic state is derived from the interrupt signal INT. Whenever an interrupt is present the GPIOx pin will be pulled high. The `gpioX_mode` should be set to output.

**VSUP\_low output**

GPIOx pin will go high if VSUP falls below ResVoltFall and SupResEn = 0. The gpioX\_mode should be set to output.

**GPIO interrupt input**

A falling or rising edge will set the gpio\_int bit. The gpioX\_mode should be set to input.

**Current sink PWM input**

The GPIO is used as PWM input for the current sink to control the current. 100% PMW mode will set the current to the value set by currX\_current. The PWM control has to be enabled with currX\_ctrl = 11b for each current sink to be controlled. The gpioX\_mode should be set to input.

**Vselect input**

As long as the GPIOx pin is low the DCDC/LDOs operate with the normal register settings. If the GPIOx pin goes high the settings will change to the ones stored in regX\_voltage. The gpioX\_mode should be set to input.

The regulator affected by this mode is selected by regX\_select. While GPIO3 & GPIO4 always control all regulators selected by regX\_select, GPIO1 and GPIO2 may be used to control two regulators separately.:

**Figure 58:**  
**GPIO Vselect Modes**

gpio1_iosf =	gpio2_iosf =	Vselect mode
<> 5	<> 5	No voltage select by GPIO for regulator
<> 5	5	GPIO2 controls regulator selected by <a href="#">reg1_select</a> , <a href="#">reg2_select</a> and <a href="#">reg3_select</a>
5	<> 5	GPIO1 controls regulator selected by <a href="#">reg1_select</a> , <a href="#">reg2_select</a> and <a href="#">reg3_select</a>
5	5	GPIO1 controls regulator selected by <a href="#">reg1_select</a> GPIO2 controls regulator selected by <a href="#">reg2_select</a>

**Stand-by and Vselect input**

This mode is very similar to the Vselct mode described in the previous paragraph. In addition to switch between 2 register settings of 3 regulators the chip is set into stand-by mode when the GPIOx pin goes high and wakes up again when the pin is pulled low and the gpio\_restart\_int is activated. The gpioX\_mode should be set to input.

Only one GPIO is needed to control the stand-by function and voltage setting of all 3 selectable regulators. It's not recommended to set this mode (gpioX\_iosf=6) for more than one GPIO at the same time. It's not possible to control the regulators by different GPIOs.

#### ***PWRGOOD output***

This signal will go high at the end of the start-up sequence. This can be used as an second reset signal to the processor to e.g. start oscillators.

The gpioX\_mode should be set to output.

#### ***Q32k output***

When selected the GPIOx will provide the 32kHz RTC crystal frequency. If the oscillator is not enabled or not assembled the internal RC oscillator based clock will be used for the output.

The gpioX\_mode should be set to output.

#### ***Watchdog input***

When pulling the GPIO high the watchdog will be triggered to avoid a reset cycle initiated by the watchdog. The gpioX\_mode should be set to input.

#### ***SU1 OC output***

This output signal can be used to control an external disconnect transistor if SU1 detects an over current condition. The gpioX\_mode should be set to output.

#### ***Charger active output***

When selected, the GPIOx will go high if the charger is active. The gpioX\_mode should be set to output.

#### ***EOC output***

When selected, the GPIOx will go high if the charger has reached the EOC state. The gpioX\_mode should be set to output.

#### ***100/500mA charger input***

With this function the charger input current limiter can be set to 100 or 500mA (low power or high power USB limit). The gpioX\_mode should be set to input.

#### ***500/2.5A charger input***

With this function the charger input current limiter can be set to 500 or 2.5A (high power USB limit or full current enabled). The gpioX\_mode should be set to input.

#### ***Charging enable input***

When pulling the GPIO to high the charger is being enabled and vice versa. This is to enable the charger without I<sup>2</sup>C communication. The gpioX\_mode should be set to input.

### PWM output

The gpio block includes an internal programmable PWM generator (can be connected to any of the GPIO outputs). Its timing is defined by `pwm_h_time`, `pwm_l_time` and `pwm_div`. The `gpioX_mode` should be set to output.

### Parameter

**Figure 59:**

$R_{pull-down}$	Pull-down resistance	Digital input; if enabled; VSUP_GPIO=3.6V		300		$k\Omega$

## Supervisor

All LDO's, the DCDC step ups and DCDC step downs have an integrated over-current protection.

An overtemperature protection of the chip is also integrated which can be switched ON with the serial interface signal temp\_pmc\_on (enabled by default; it is not recommended to disable the over-temperature protection).

## Description

The chip has two signals for the serial interface: ov\_temp\_110 and ov\_temp\_140. The flag ov\_temp\_110 is automatically reset if the overtemperature condition is removed, whereas ov\_temp\_140 has to be reset by the serial interface with the signal rst\_ov\_temp\_140.

If the flag ov\_temp\_140 is set, an automatic reset of the complete chip is initiated. The chip will only start-up when the temperature falls below the  $T_{110}$  level (including hysteresis).

The flag ov\_temp\_140 is not affected by this reset cycle allowing the software to detect the reason for this unexpected shutdown.

**Figure 60:**  
Over-temperature Detection

Symbol	Parameter	Note	Min	Typ	Max	Unit
$T_{110}$	ov_temp_110 rising threshold		95	110	125	°C
$T_{140}$	ov_temp_140 rising threshold		125	140	155	°C
$T_{hyst}$	ov_temp_110 and ov_temp_140 hysteresis			5		°C

## Watchdog

### Description

The purpose of the watchdog is to detect a deadlock of the software. If the watchdog is active, it must receive a continuous trigger signal within a programmable time window. If there is no signal anymore for a certain time period from a defined pad or special serial interface bit, it starts either a complete reset cycle or changes the state of an output pin, which can be used e.g. as an interrupt to the processor.

- The watchdog is highly configurable by the following register bits:
- The complete block can be switched ON by `wtdg_on = 1` and OFF by `wtdg_on = 0`.
- The watchdog time window is defined by the register `wtdg_min_timer` and `wtdg_max_timer`.
- The trigger signal can be configured by register `wtdg_sw_sig` and `gpio1_iosf` or `gpio4_iosf`.
- If the watchdog expires, the system can start automatically a reset cycle if `wtdg_reset_on = 1`.

### Parameter

Figure 61:  
Watchdog Timing Diagram

## Interrupt Generation

### *Description*

The interrupt controller generates an interrupt request for the host controller as soon as one or more of the bits in the Interrupt 1 to 3 register are set by pulling high pin INT (INT has to be selected as a GPIO output function). The output polarity can be changed to active low (XINT) by using the gpioX\_invert bit of the selected GPIO. All the interrupt sources can be enabled in the Interrupt Mask 1 to 3 register. The Interrupt 1 to 3 registers are cleared automatically after the host controller has read them. To prevent the AS3711 device from losing an interrupt event, the register that is read is captured before it is transmitted to the host controller via the serial interface. As soon as the transmission of the captured value is complete a logical AND operation with the bit wise inverted captured value is applied to the register to clear all interrupt bits that have already been transmitted. Clearing the read interrupt bits takes 2 clock cycles, a read access to the same register before the clearing process has completed will yield a value of '0'. Note that an interrupt that has been present at the previous read access will be cleared as well in case it occurs again before the clearing process has completed.

During a read access to one of the interrupt registers the INT pin will be released. As soon as the transferred bits of the interrupt register have been cleared the INT pin will be pulled high in case a new interrupt has occurred in the meantime. By doing so the interrupt controller will work correctly with host controllers that are edge- and level-sensitive on their interrupt request input. Multiple byte read access is recommended to avoid reading the Interrupt 1 register over and over again in response to a new interrupt that has occurred in the same register (and thus pulling high pin INT) before the Interrupt 2,3 register has been read.

## 10-Bit ADC

This general purpose ADC can be used for measuring several voltages and currents to perform functions like battery monitor, temperature supervision, button press detection, etc.

### Input Sources

**Figure 62:**

## Real Time Clock

### **Description**

The RTC is only available in QFN56 package. The RTC module provides time information to the system. It is implemented as a 6-bit counter that is incremented every second - with the 32kHz oscillator delivering the necessary accurate time base - and is reset to 0 each time the counter value is 60. An additional 24-bit minute counter is incremented each time the 6-bit counter is reset to 0. Both counters are set to 0 at a power-on-reset. The host controller can set the counter to any value by setting the RTC 1 to 4 registers.

To prevent ambiguous time information because of the 30-bit value being incremented before all of the 4 registers have been read or written, a 30-bit parallel shadow register is implemented. Every time a write/read access via the serial interface occurs the parallel shadow register is updated with the current value of the 30-bit counter. Any write access to the RTCSecond register will disable the update of the parallel register and set the value of the appropriate byte of the parallel register. Any subsequent write access to the RTCMinute3 register will transfer the current value of the 30-bit parallel register to the RTCSecond/Minute1 to 3 registers and the update of the parallel register is enabled again. Similarly, any read access to the RTCSecond register will freeze the current value of the parallel register and submit the appropriate byte to the host controller via the serial interface. Any subsequent read access to the RTCMinute3 register will enable the update of the parallel register again. This mechanism makes sure that the maximum error of the value that is written to or read from the registers is 1 second.

To start the RTC, rtc\_on bit has to be set to 1.

The RTC stops automatically at its highest value (3B,FF,FF,FF) to prevent overrun.

### **Alarm**

The RTC module includes an alarm function. When the content of the RTCArm registers equals the content of the RTC registers bit rtc\_alarm will be set in the interrupt register. Furthermore the RTC module can generate a repeating interrupt every second, every minute, every 2 minutes or every 8 minutes.

To avoid ambiguous behavior during write access to the RTCArm registers any write access to the RTCArmSecond register will disable the alarm function; any subsequent write access to the RTCArmMinute3 will enable the alarm function again.

## 2-Wire-Serial Control Interface

### Feature List

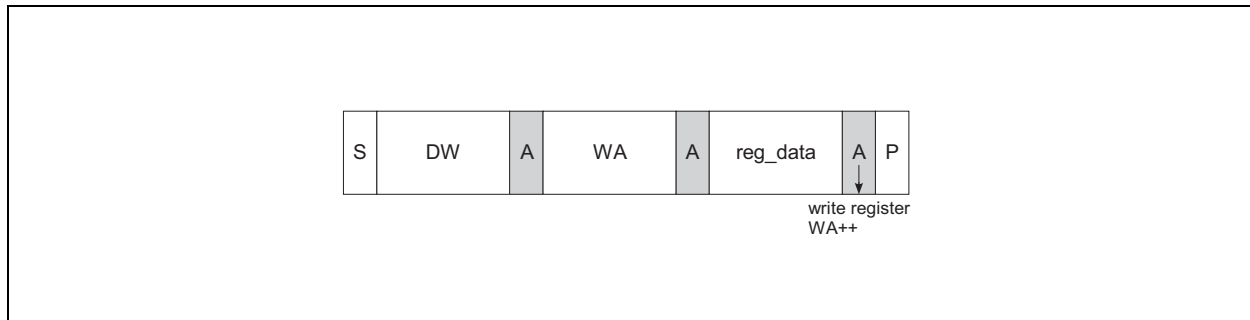

- Fast-mode capability (max. SCL-frequency is 400 kHz)
- 7+1-bit addressing mode
- 60h x 8-bit data registers (word address 0x00 - 0x60)
- Write formats: Single-Byte-Write, Page-Write
- Read formats: Current-Address-Read, Random-Read, Sequential-Read
- SDA input delay and SCL spike filtering by integrated RC-components

### Protocol

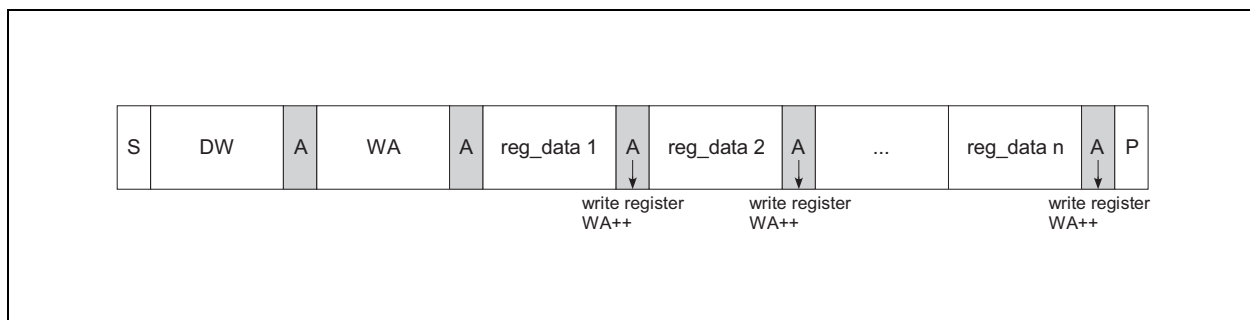

**Figure 65:**  
2-Wire Serial Symbol Definition

Symbol	Definition	RW	Note
S	Start condition after stop	R	1 bit
Sr	Repeated start	R	1 bit
DW	Device address for write	R	1000 0000b (80h)
DR	Device address for read	R	1000 0001b (81h)
WA	Word address	R	8 bit
A	Acknowledge	W	1 bit
N	No Acknowledge	R	1 bit
reg_data	Register data/write	R	8 bit
data (n)	Register data/read	W	8 bit
P	Stop condition	R	1 bit
WA++	Increment word address internally	R	During acknowledge

**Figure 66:**  
**Byte Write**

**Figure 67:**  
**Page Write**

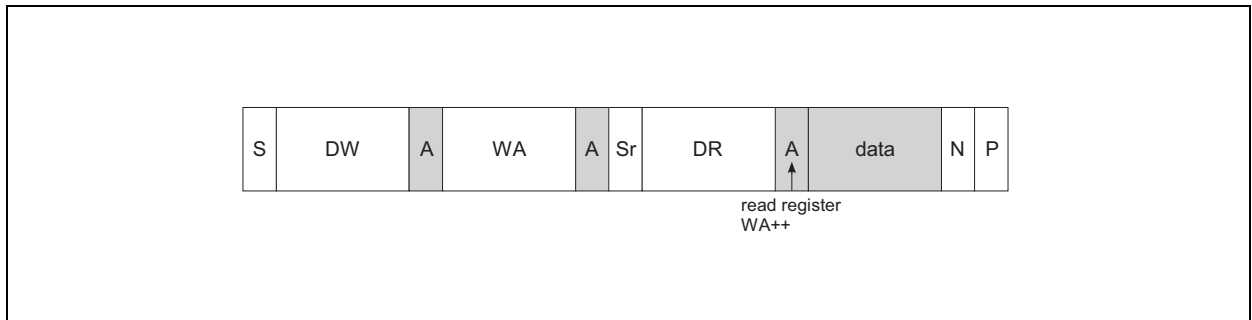

Byte Write and Page Write formats are used to write data to the slave.

The transmission begins with the START condition, which is generated by the master when the bus is in IDLE state (the bus is free). The device write address is followed by the word address. After the word address any number of data bytes can be sent to the slave. The word address is incremented internally, in order to write subsequent data bytes on subsequent address locations.

For reading data from the slave device, the master has to change the transfer direction. This can be done either with a repeated START condition followed by the device-read address, or simply with a new transmission START followed by the device-read address, when the bus is in IDLE state. The device-read address is always followed by the 1st register byte transmitted from the slave. In Read Mode any number of subsequent register bytes can be read from the slave. The word address is incremented internally.

**Figure 68:**  
Random Read

Random Read and Sequential Read are combined formats. The repeated START condition is used to change the direction after the data transfer from the master.

The word address transfer is initiated with a START condition issued by the master while the bus is idle. The START condition is followed by the device-write address and the word address.

In order to change the data direction a repeated START condition is issued on the 1st SCL pulse after the acknowledge bit of the word address transfer. After the reception of the device-read address, the slave becomes the transmitter. In this state the slave transmits register data located by the previous received word address vector. The master responds to the data byte with a not-acknowledge, and issues a STOP condition on the bus.

**Figure 69:**  
Sequential Read

Sequential Read is the extended form of Random Read, as more than one register-data bytes are transferred subsequently. In difference to the Random Read, for a sequential read the transferred register-data bytes are responded by an acknowledge from the master. The number of data bytes transferred in one sequence is unlimited (consider the behavior of the word-address counter). To terminate the transmission the master has to send a not-acknowledge following the last data byte and generate the STOP condition subsequently.

**Figure 70:**  
**Current Address Read**

To keep the access time as small as possible, this format allows a read access without the word address transfer in advance to the data transfer.

The bus is idle and the master issues a START condition followed by the Device-Read address. Analogous to Random Read, a single byte transfer is terminated with a not-acknowledge after the 1st register byte. Analogous to Sequential Read an unlimited number of data bytes can be transferred, where the data bytes has to be responded with an acknowledge from the master. For termination of the transmission the master sends a not-acknowledge following the last data byte and a subsequent STOP condition.

**Parameter**

**Figure 71:**  
**I<sup>2</sup>C SDA,SCL Characteristics**

Symbol	Parameter	Note	Min	Typ	Max	Unit
V <sub>IL</sub>	SCL,SDA Low Level input voltage		-0.3		0.4	V
V <sub>IH</sub>	SCL,SDA High Level input voltage		1.4		VSUP_G PIO	V

GPIOsignal\_out Register (Address 20h)

Addr: 20h		GPIOsignal_out		
Bit	Bit Name	Default	Access	Bit Description
7:4	-	'b0000	n/a	Do not use
3	gpio4_out	0	RW	This bit determines the output signal of the GPIO4 pin when selected as output source.
2	gpio3_out	0	RW	This bit determines the output signal of the GPIO3 pin when selected as output source.
1	gpio2_out	0	RW	This bit determines the output signal of the GPIO2 pin when selected as output source.
0	gpio1_out	0	RW	This bit determines the output signal of the GPIO1 pin when selected as output source.

**Figure 91:**  
GPIOsignal\_in Register (Address 21h)

Addr: 21h		GPIOsignal_in		
Bit	Bit Name	Default	Access	Bit Description
7:4	-	'b0000	n/a	Do not use
3	gpio4_in	0	RO	This bit reflects the logic level of the GPIO4 pin when configured as digital input pin.
2	gpio3_in	0	RO	This bit reflects the logic level of the GPIO3 pin when configured as digital input pin.
1	gpio2_in	0	RO	This bit reflects the logic level of the GPIO2 pin when configured as digital input pin.
0	gpio1_in	0	RO	This bit reflects the logic level of the GPIO1 pin when configured as digital input pin.

**Figure 92:**  
Reg1\_Voltage Register (Address 22h)

Addr: 22h		Reg1_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:0	reg1_voltage	'b0000 0000	RW	This register is mapped to the register address 0h+Reg1_select, if gpioX_iosf = 5 or 6 (Vselect input), and the GPIOx input = 1. This feature allows voltage switching of a predefined regulator with just one GPIO input. <b>0..FFh</b> : Selects voltage, ilimit, on or frequency bits of LDO or DCDC

**Figure 93:**  
Reg2\_Voltage Register (Address 23h)

Addr: 23h		Reg2_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:0	reg2_voltage	'b0000 0000	RW	This register is mapped to the register address 0h+Reg3_select, if gpioX_iosf=5 or 6 (Vselect input), and GPIOx input = 1, This feature allows voltage switching of a predefined regulator with just one GPIO input <b>0..FFh</b> : Selects voltage, ilimit, on or frequency bits of LDO or DCDC

**Figure 94:**  
Reg\_control Register (Address 24h)

Addr: 24h		Reg_Control		
Bit	Bit Name	Default	Access	Bit Description
7:4	reg2_select	'b1111	RW	Selects regulator for mapping feature; if reg_select2 ≥ 0Ch, then feature is disabled.
3:0	reg1_select	'b1111	RW	Selects regulator for mapping feature; if reg_select1 ≥ 0Ch, then feature is disabled.

**Figure 95:**  
GPIOctrl\_sd Register (Address 25h)

Addr: 25h		GPIOctrl_sd		
Bit	Bit Name	Default	Access	Bit Description
7:6	gpio_ctrl_sd4	'b00	RW	Enable GPIO control of DCDC SD4. GPIO ctrl only enabled, if <a href="#">sd4_vsel</a> > 0 <b>0</b> : No GPIO control <b>1</b> : Controlled by GPIO1 <b>2</b> : Controlled by GPIO2 <b>3</b> : Controlled by GPIO3
5:4	gpio_ctrl_sd3	'b00	RW	Enable GPIO control of DCDC SD3. GPIO ctrl only enabled, if <a href="#">sd3_vsel</a> > 0 <b>0</b> : No GPIO control <b>1</b> : Controlled by GPIO1 <b>2</b> : Controlled by GPIO2 <b>3</b> : Controlled by GPIO3
3:2	gpio_ctrl_sd2	'b00	RW	Enable GPIO control of DCDC SD2. GPIO ctrl only enabled, if <a href="#">sd2_vsel</a> > 0 <b>0</b> : No GPIO control <b>1</b> : Controlled by GPIO1 <b>2</b> : Controlled by GPIO2 <b>3</b> : Controlled by GPIO3
1:0	gpio_ctrl_sd1	'b00	RW	Enable GPIO control of DCDC SD1. GPIO ctrl only enabled, if <a href="#">sd1_vsel</a> > 0 <b>0</b> : No GPIO control <b>1</b> : Controlled by GPIO1 <b>2</b> : Controlled by GPIO2 <b>3</b> : Controlled by GPIO3

1:0	gpio_ctrl_Ido5	'b00	RW	Enable GPIO control of LDO5. GPIO ctrl only enabled, if <a href="#">ldo5_on</a> = 1 <b>0</b> : No GPIO control <b>1</b> : Controlled by GPIO1 <b>2</b> : Controlled by GPIO2 <b>3</b> : Controlled by GPIO3

**Figure 98:**  
**Reg3\_Voltage Register (Address 2bh)**

Addr: 2bh		Reg3_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:0	reg3_voltage	'b0000 0000	RW	This register is mapped to the register address 0h+Reg3_select, if gioX_iosf=5 or 6 (Vselect input), and GPIOx input = 1, This feature allows voltage switching of a predefined regulator with just one GPIO input <b>0..FFh</b> : Selects voltage, ilimit, on or frequency bits of LDO or DCDC

**Figure 99:**  
**Reg\_control3 Register (Address 2ch)**

Addr: 2ch		Reg3_Voltage		
Bit	Bit Name	Default	Access	Bit Description
7:4	-	'b0000	n/a	Do not use
3:0	reg3_select	'b1111	RW	Selects regulator for mapping feature; if reg_select3 ≥ 0Ch, then feature is disabled.

**Figure 100:**  
SD\_control1 Register (Address 30h)

Addr: 30h		SD_control1		
Bit	Bit Name	Default	Access	Bit Description
7	sd4_low_noise	0	RW	Enables low noise mode of SD4. If enabled, smaller current pulses and output ripple is activated. <b>0</b> : Normal mode. Minimum current pulses of >100mA applied in skip mode. <b>1</b> : Low noise mode. Only minimum on time applied in skip mode.
6	sd3_low_noise	0	RW	Enables low noise mode of SD3. If enabled, smaller current pulses and output ripple is activated. <b>0</b> : Normal mode. Minimum current pulses of >100mA applied in skip mode. <b>1</b> : Low noise mode. Only minimum on time applied in skip mode.
5	sd2_low_noise	0	RW	Enables low noise mode of SD2. If enabled, smaller current pulses and output ripple is activated. <b>0</b> : Normal mode. Minimum current pulses of >100mA applied in skip mode. <b>1</b> : Low noise mode. Only minimum on time applied in skip mode.
4	sd1_low_noise	0	RW	Enables low noise mode of SD1. If enabled, smaller current pulses and output ripple is activated. <b>0</b> : Normal mode. Minimum current pulses of >100mA applied in skip mode. <b>1</b> : Low noise mode. Only minimum on time applied in skip mode.
3	sd4_fast	0	RW	Selects a faster regulation mode for SD4 suitable for larger load changes. <b>0</b> : Normal mode <b>1</b> : Fast mode, double Cext required (see external components)
2	sd3_fast	0	RW	Selects a faster regulation mode for SD3 suitable for larger load changes. <b>0</b> : Normal mode <b>1</b> : Fast mode, double Cext required (see external components)
1	sd2_fast	0	RW	Selects a faster regulation mode for SD2 suitable for larger load changes. <b>0</b> : Normal mode <b>1</b> : Fast mode, double Cext required (see external components)
0	sd1_fast	0	RW	Selects a faster regulation mode for SD1 suitable for larger load changes. <b>0</b> : Normal mode <b>1</b> : Fast mode, double Cext required (see external components)

**Figure 101:**  
SD\_control2 Register (Address 31h)

Addr: 31h		SD_control2		
Bit	Bit Name	Default	Access	Bit Description
7:6	sd_dvm_select	'b00	RW	Apply DVM counter to the following DCDC converter: <b>0</b> : Select SD1 for DVM <b>1</b> : Select SD2 for DVM <b>2</b> : Select SD3 for DVM <b>3</b> : Select SD4 for DVM
5:4	dvm_time	'b00	RW	Time steps of DVM voltage change of selected step down, if voltage of step Down is changed during operation (sd <sub>x</sub> _vsel) voltage is decreased/increased by single steps 12.5mV <b>0</b> : 0 μsec, immediate change (no DVM) <b>1</b> : 4 μsec time delay between steps <b>2</b> : 8 μsec time delay between steps <b>3</b> : 16 μsec time delay between steps
3	sd3_slave	0	RW	Enables slave mode of SD3 <b>0</b> : Normal mode of SD3 <b>1</b> : SD3 is slave of SD2
2	sd3_fsel	0	RW	Selects between high and low frequency range <b>0</b> : 2 or 3MHz frequency (selectable by <a href="#">sd3_frequ</a> ) <b>1</b> : 3 or 4MHz frequency (selectable by <a href="#">sd3_frequ</a> )
1	sd2_fsel	0	RW	Selects between high and low frequency range <b>0</b> : 2 or 3MHz frequency (selectable by <a href="#">sd2_frequ</a> ) <b>1</b> : 3 or 4MHz frequency (selectable by <a href="#">sd2_frequ</a> )
0	sd1_fsel	0	RW	Selects between high and low frequency range <b>0</b> : 2 or 3MHz frequency (selectable by <a href="#">sd1_frequ</a> ) <b>1</b> : 3 or 4MHz frequency (selectable by <a href="#">sd1_frequ</a> )

**Figure 102:**  
**Battery\_voltage\_monitor Register (Address 32h)**

Addr: 32h		Battery_voltage_monitor		
Bit	Bit Name	Default	Access	Bit Description
7	FastResEn	0	RW	<b>0</b> : ResVoltFall debounce time = 3msec <b>1</b> : ResVoltFall debounce time = 49sec
6	SupResEn	0	RW	<b>0</b> : A reset is generated if VSUP falls below 2.7V ** <b>1</b> : A reset is generated if VSUP falls below ResVoltFall ** If VBAT falls below ResVoltFall only an interrupt is generated (if enabled) and the $\mu$ Processor can shut down the system)
5:3	ResVoltFall	'b000	RW	This value determines the reset level ResVoltFall for falling VBAT. It is recommended to set this value at least 200mV lower than ResVoltRise <b>0</b> : 2.7V <b>1</b> : 2.9V <b>2</b> : 3.1V <b>3</b> : 3.2V <b>4</b> : 3.3V <b>5</b> : 3.4V <b>6</b> : 3.5V <b>7</b> : 3.6V
2:0	ResVoltRise	'b000	RO (OTP)	This value determines the reset level ResVoltRise for rising VBAT. It is recommended to set this value at least 200mV higher than ResVoltFall <b>0</b> : 2.7V <b>1</b> : 2.9V <b>2</b> : 3.1V <b>3</b> : 3.2V <b>4</b> : 3.3V <b>5</b> : 3.4V <b>6</b> : 3.5V <b>7</b> : 3.6V

**Figure 103:**  
Startup\_Control Register (Address 33h)

Addr: 33h		Startup_Control		
Bit	Bit Name	Default	Access	Bit Description
7:2	-	'b00 0000	n/a	Do not use
1	chg_pwr_off_en	0	RO (OTP)	Select charger detection in power OFF mode Read only (OTP setting) <b>0</b> : Exit of Power OFF mode, if charger is detected (level detection) <b>1</b> : Exit of Power OFF mode, if charger insertion is detected (rising edge detection) .
0	power_off_at_vsuplow	0	RW	Switch ON Power OFF mode if low VSUP is detected during active or standby mode (Pin ON= low and bit <a href="#">auto_off=0</a> ) <b>0</b> : If low battery is detected, battery voltage is continuously monitored and chip startup initiated if battery voltage is above <a href="#">ResVoltRise</a> <b>1</b> : If low battery is detected, enter power OFF mode

**Figure 104:**  
ResetTimer Register (Address 34h)

Addr: 34h		ResetTimer		
Bit	Bit Name	Default	Access	Bit Description
7	-	'b0	n/a	Do not use
6	stby_reset_disable	0	RW	Disable Reset output signal (pin XRES) in standby mode. <b>0</b> : Normal mode, reset is active in standby mode <b>1</b> : No reset in standby mode and during exit of standby mode
5	auto_off	0	RO	Defines startup behavior at first battery insertion <b>0</b> : Startup of chip if VBAT>ResVoltRise <b>1</b> : Enter power OFF mode (Startup with ON key or charger insertion)
4:3	off_delay	'b01	RW	Set Delay between I <sup>2</sup> C command, GPIO or Reset signal for power_off, standby mode or reset and execution of that command. <b>0</b> : No delay <b>1</b> : 8 msec <b>2</b> : 16 msec <b>3</b> : 32 msec
2	-	'b0	n/a	Do not use
1:0	res_timer	'b00	RW	Set RESTime, after the last regulator has started <b>0</b> : RESTIME = 10ms <b>1</b> : RESTIME = 50ms <b>2</b> : RESTIME = 100ms <b>3</b> : RESTIME = 150ms

**Figure 105:**  
ReferenceControl Register (Address 35h)

Addr: 35h		ReferenceControl		
Bit	Bit Name	Default	Access	Bit Description
7	on_reset_delay	0	RW	Sets the ON reset delay time <b>0</b> : 8 sec (if <a href="#">onkey_reset=1</a> ) <b>1</b> : 4 sec (if <a href="#">onkey_reset=1</a> )
6	reg_low_bias_mode	0	RW	Sets the ON reset delay time <b>0</b> : Normal operation <b>1</b> : Reduces the bias for the analog LDO1 and LDO2
5	clk_div2	0	RW	Divide internal clock oscillator by 2 to reduce quiescent current for low power operation <b>0</b> : Normal mode <b>1</b> : Internal clock frequency divided by two. All timings are increased by two. Switching frequency of all DCDC converters are divided by two. Reduced transient performance of DCDC converters.
4	standby_mode_on	0	RW	Setting to 1 sets the PMU into standby mode. All regulators are disabled except those regulators enabled by register Reg standby mode. XRES will be pulled to low. A normal startup of all regulators will be done with any interrupt (has to be enabled before entering standby mode). During this startup, regulators defined by Reg standby mode register are continuously ON.
3:1	clk_int	'b000	RW	Sets the internal CLK frequency $f_{CLK}$ used for DCDCs, PWM, ... <b>0</b> : 4 MHz (default) <b>1</b> : 3.8 MHz <b>2</b> : 3.6 MHz <b>3</b> : 3.4 MHz <b>4</b> : 3.2 MHz <b>5</b> : 3.0 MHz <b>6</b> : 2.8 MHz <b>7</b> : 2.6 MHz All frequencies, timings and delays in this datasheet are based on 4MHz <a href="#">clk_int</a>
0	low_power_on	0	RW	Enable low power mode of internal reference. <b>0</b> : Standard mode <b>1</b> : Low power mode -all specification except noise parameters are still valid. Iq reduced by approx. 30µA

**Figure 106:**  
ResetControl Register (Address 36h)

Addr: 36h		ResetControl		
Bit	Bit Name	Default	Access	Bit Description
7	onkey_reset	0	RW	<b>0</b> : Reset after 4/8 seconds ON pressed disabled <b>1</b> : Reset after 4/8 seconds ON pressed enabled
6:3	reset_reason	'b0000	RW	Flags to indicate to the software the reason for the last reset <b>0</b> : V <sub>POR</sub> has been reached (battery or charger insertion from scratch) <b>1</b> : ResVoltFall was reached (battery voltage drop below 2.75V) <b>2</b> : Software forced by <a href="#">force_reset</a> <b>3</b> : Software forced by <a href="#">power_off</a> and ON was pulled high <b>4</b> : Software forced by <a href="#">power_off</a> and charger was detected <b>5</b> : External triggered through the pin XRES <b>6</b> : Reset caused by overtemperature T140 <b>7</b> : Reset caused by watchdog <b>8</b> : Reset caused by 4/8 seconds ON press <b>9</b> : NA <b>10</b> : Reset caused by RTC repeated wakeup or alarm wakeup <b>11</b> : Reset caused by interrupt in standby mode <b>12</b> : Reset caused by ON pulled high in standby mode
2	on_input	0	R_PUSH	<b>Read:</b> This flag represents the state of the ON pad directly <b>Write:</b> Setting to 1 resets the 4/8 sec. <a href="#">onkey_reset</a> timer
1	power_off	0	RW	Setting to 1 starts a reset cycle, but waits after the Reg_off state for a rising edge on the pin ON or until the charger is detected.
0	force_reset	0	RW	Setting to 1 starts a complete reset cycle

**Figure 107:**  
**OvertemperatureControl Register (Address 37h)**

Addr: 37h		OvertemperatureControl		
Bit	Bit Name	Default	Access	Bit Description
7:4	-	'b0000	n/a	Do not use
3	rst_ov_temp_140	0	RW	If the over-temperature threshold 2 has been reached, the flag <code>ov_temp_140</code> is set and a reset cycle is started. <code>ov_temp_140</code> should be reset by writing 1 and afterward 0 to <code>rst_ov_temp_140</code> .
2	ov_temp_140	0	RO	Flag that the over-temperature threshold 2 (T140) has been reached -this flag is not reset by a over-temperature caused reset and has to be reset by <code>rst_ov_temp_140</code> .
1	ov_temp_110	0	RO	Flag that the over-temperature threshold 1 (T110) has been reached
0	temp_pmc_on	1	RO	Switch ON /OFF of temperature supervision; default: ON -all other bits are only valid if set to 1. Leave at 1, do not disable

**Figure 108:**  
**WatchdogControl Register (Address 38h)**

Addr: 38h		WatchdogControl		
Bit	Bit Name	Default	Access	Bit Description
7:2	-	'b00 0000	n/a	Do not use
1	wtdg_res_on	0	RW	If the watchdog expires and <code>wtdg_res_on = 1</code> a reset cycle will be started
0	wtdg_on	0	RW	Switches ON the complete watchdog <b>0</b> : Watchdog OFF <b>1</b> : Watchdog enabled

**Figure 109:**  
**Reg\_standby\_mod1 Register (Address 39h)**

Addr: 39h		Reg_standby_mod1		
Bit	Bit Name	Default	Access	Bit Description
7	disable_regpd	0	RW	This bit disables the pulldown of all regulators <b>0</b> : Normal operation approx. 1kΩ pulldown of all regulators <b>1</b> : Pulldown disabled >100kΩ of all regulators
6:4	-	b000	n/a	Do not use
3	sd4_stby_on	0	RW	Enable Step down 4 in standby mode
2	sd3_stby_on	0	RW	Enable Step down 3 in standby mode
1	sd2_stby_on	0	RW	Enable Step down 2 in standby mode
0	sd1_stby_on	0	RW	Enable Step down 1 in standby mode

**Figure 110:**  
**Reg\_standby\_mod2 Register (Address 3ah)**

Addr: 3ah		Reg_standby_mod2		
Bit	Bit Name	Default	Access	Bit Description
7	ldo8_stby_on	0	RW	Enable LDO8 in standby mode
6	ldo7_stby_on	0	RW	Enable LDO7 in standby mode
5	ldo6_stby_on	0	RW	Enable LDO6 in standby mode
4	ldo5_stby_on	0	RW	Enable LDO5 in standby mode
3	ldo4_stby_on	0	RW	Enable LDO4 in standby mode
2	ldo3_stby_on	0	RW	Enable LDO3 in standby mode
1	ldo2_stby_on	0	RW	Enable LDO2 in standby mode
0	ldo1_stby_on	0	RW	Enable LDO1 in standby mode

**Figure 111:**  
curr\_control Register (Address 40h)

Addr: 40h		curr_control		
Bit	Bit Name	Default	Access	Bit Description
7:4	curr3_ctrl	'b0000	RW	ON/OFF control of the pad CURR3 <b>0</b> : Current sink is turned OFF <b>1</b> : Current sink is active <b>2</b> : Current sink is active and LED string connected to SU2. Required for automatic feedback selection. <b>3</b> : Controlled by internal PWM generator, or external, if gpioX_iosf=4 <b>4</b> : XINT output (active low interrupt output) <b>5</b> : VSUP_low output <b>6</b> : Charger active output <b>7</b> : EOC output <b>8</b> : Inverted signal of ON pin as output <b>9</b> : Signal of ON pin as output <b>10</b> : Q32k output (if rtc_on=0 then internal RC oscillator with 32kHz divider is used) <b>11</b> : PWM output <b>12</b> : PWRGOOD output <b>13-15</b> : NA
3:2	curr2_ctrl	'b00	RW	ON/OFF control of the pad CURR2 <b>0</b> : Current sink is turned OFF <b>1</b> : Current sink is active <b>2</b> : Current sink is active and LED string connected to SU2. Required for automatic feedback selection. <b>3</b> : Controlled by internal PWM generator, or external, if gpioX_iosf=4
1:0	curr1_ctrl	'b00	RW	ON/OFF control of the pad CURR1 <b>0</b> : Current sink is turned OFF <b>1</b> : Current sink is active <b>2</b> : Current sink is active and LED string connected to SU2. Required for automatic feedback selection. <b>3</b> : Controlled by internal PWM generator, or external, if gpioX_iosf=4

Figure 112:  
pwm\_control\_l Register (Address 41h)

Addr: 41h		pwm_control_l		
Bit	Bit Name	Default	Access	Bit Description
7:0	pwm_l_time	'b00000000	RW	This bit defines the low time of the PWM generator in 1MHz units. <b>0</b> : pwm_div * 1µsec <b>1</b> : pwm_div * 2µsec <b>2</b> : pwm_div * 3µsec ... : ... <b>255</b> : pwm_div * 256µsec

Figure 113:  
pwm\_control\_h Register (Address 42h)

Addr: 42h		pwm_control_h		
Bit	Bit Name	Default	Access	Bit Description
7:0	pwm_h_time	'b00000000	RW	This bit defines the high time of the PWM generator in 1MHz units. <b>0</b> : pwm_div * 1µsec <b>1</b> : pwm_div * 2µsec <b>2</b> : pwm_div * 3µsec ... : ... <b>255</b> : pwm_div * 256µsec

Figure 114:  
curr1\_value Register (Address 43h)

Addr: 43h		curr1_value		
Bit	Bit Name	Default	Access	Bit Description
7:0	curr1_current	'b00000000	RW	Defines the current into CURR1, if enabled by curr1_ctrl <b>0</b> : Power down (default state) <b>1</b> : 0.1563mA (LSB) ... : ... <b>255</b> : 39.84mA

**Figure 115:**  
curr2\_value Register (Address 44h)

Addr: 44h		curr2_value		
Bit	Bit Name	Default	Access	Bit Description
7:0	curr2_current	'b00000000	RW	Defines the current into CURR2, if enabled by curr2_ctrl <b>0</b> : Power down (default state) <b>1</b> : 0.1563mA (LSB) ... : ... <b>255</b> : 39.84mA

**Figure 116:**  
curr3\_value Register (Address 45h)

Addr: 45h		curr3_value		
Bit	Bit Name	Default	Access	Bit Description
7:0	curr3_current	'b00000000	RW	Defines the current into CURR3, if enabled by curr3_ctrl <b>0</b> : Power down (default state) <b>1</b> : 0.1563mA (LSB) ... : ... <b>255</b> : 39.84mA

**Figure 117:**  
Watchdog\_min\_timer Register (Address 46h)

Addr: 46h		Watchdog_min_timer		
Bit	Bit Name	Default	Access	Bit Description
7:0	wtdg_min_timer	'b00000000	RW	Defines the minimum watchdog trigger time (LSB=7.5ms, range: 0 - 1.9s)

**Figure 118:**  
Watchdog\_max\_timer Register (Address 47h)

Addr: 47h		Watchdog_max_timer		
Bit	Bit Name	Default	Access	Bit Description
7:0	wtdg_max_timer	'b00000000	RW	Defines the maximum watchdog trigger time (LSB=7.5ms, range: 7.5ms - 1.9s), do not set to (00)h

**Figure 119:**  
**WatchdogSoftwareSignal Register (Address 48h)**

Addr: 48h		WatchdogSoftwareSignal		
Bit	Bit Name	Default	Access	Bit Description
7:6	pwm_div	'b00	RW	This bit defines the divider ratio of the prescaler for the PWM generator. <b>0</b> : Divide by 1 <b>1</b> : Divide by 2 <b>2</b> : Divide by 4 <b>3</b> : Divide by 16
0	wtdg_sw_sig	0	PUSH	Trigger input by the serial interface if gpioX_iosf<>9

**Figure 120:**  
**Stepup\_control1 Register (Address 50h)**

Addr: 50h		Stepup_control1		
Bit	Bit Name	Default	Access	Bit Description
7:3	stepup1_v	'b0000	RW	Defines the tuning current at FB_SU1 pin; <b>0</b> : 0 $\mu$ A <b>1</b> : 1 $\mu$ A ... : ... <b>31</b> : 31 $\mu$ A
2	stepup1_res	0	RW	Gain selection for DCDC SU1 <b>0</b> : If FB_SU1 is used with current feedback only (Only R1,C1 connected) <b>1</b> : If FB_SU1 is used with external resistor divider (2 resistors)
1	stepup1_freq	0	RW	Selects SU1 frequency <b>0</b> : 1 MHz <b>1</b> : 0.5 MHz
0	stepup1_on	0	RW	ON/OFF control of SU1 <b>0</b> : SU1 OFF <b>1</b> : SU1 ON

**Figure 121:**  
**Stepup\_control2 Register (Address 51h)**

Addr: 51h		Stepup_control2		
Bit	Bit Name	Default	Access	Bit Description
7:3	stepup2_v	'b0000	RW	Defines the tuning current at FB_SU2 pin; <b>0</b> : 0 $\mu$ A <b>1</b> : 1 $\mu$ A ... : ... <b>31</b> : 31 $\mu$ A
2	stepup2_res	0	RW	Gain selection for DCDC SU2 <b>0</b> : If DCDC is used with current feedback (CURR1,CURR2,CURR3) or if FB_SU2 is used with current feedback only (Only R1,C1 connected) <b>1</b> : If FB_SU2 is used with external resistor divider (2 resistors)
1	stepup2_freq	0	RW	Selects SU3 frequency <b>0</b> : 1 MHz <b>1</b> : 0.5 MHz
0	stepup2_on	0	RW	ON/OFF control of SU2 <b>0</b> : SU2 OFF <b>1</b> : SU2 ON

**Figure 122:**  
**Stepup\_control4 Register (Address 53h)**

Addr: 53h		Stepup_control4		
Bit	Bit Name	Default	Access	Bit Description
7	stpup1_det	0	RO	SU1 detection status register <b>0</b> : VRsense < V <sub>DETECT</sub> for more than 1ms, and DCDC SU1 converter is in pulseskip for more than 1ms. <b>1</b> : VRsense > V <sub>DETECT</sub> for more than 1ms, or the DCDC SU1 converter is not in pulseskip for more than 1ms.
6	stpup1_oc	0	RO	SU1 overcurrent status bit <b>0</b> : VRsense < V <sub>OVCURRENT</sub> <b>1</b> : VRsense > V <sub>OVCURRENT</sub> for more than 5ms (latched state)
5	stpup1_oc_timeout	0	RW	Controls GPIOx switch-OFF, after overcurrent timeout (5ms) for DCDC SU1 <b>0</b> : Disabled <b>1</b> : Enabled
4	stpup1_shortprot	0	RW	Enables Protection and Detection circuit for DCDC SU1 <b>0</b> : No protection and load detection <b>1</b> : Short protection and load detection enabled
3	stpup2_pwm_lowf	0	RW	Selects PWM operation of SU2 <b>0</b> : High frequency operation PWM>20kHz** <b>1</b> : Low frequency PWM operation: <a href="#">stepup2_on</a> and curr1 to 3_on (if PWM enabled) switched OFF during PWM low time ** Step_up switched ON all the time. (current sinks are not switched OFF (currX_on=1 all the time), but currX_current masked to 00h during PWM low time.). During PWM OFF-time then feedback voltage is sampled.
2	stepup2_prot_dis	0	RW	DCDC SU2 overvoltage protection to prevent damage of external NFET, if CURR1, CURR2 or CURR3 feedback selected, and no LED string connected. <b>0</b> : Switch OFF DCDC SU2 if the voltage on FB_SU2 exceeds 1.25V <b>1</b> : Overvoltage protection disabled
1:0	stepup2_fb	'b00	RW	Controls the feedback source <b>0</b> : Voltage feedback (external resistor divider) selected by <a href="#">stepup2_fbprot</a> <b>1</b> : CURR1 feedback enabled (feedback through white LEDs) <b>2</b> : CURR2 feedback enabled (feedback through white LEDs) <b>3</b> : CURR3 feedback enabled (feedback through white LEDs)

**Figure 123:**  
Stepup\_control5 Register (Address 54h)

Addr: 54h		Stepup_control5		
Bit	Bit Name	Default	Access	Bit Description
7:4	-	'b0000	n/a	Do not use
3	stepup2_pwm_mode	0	RW	Enable PWM mode <b>0</b> : Normal operation <b>1</b> : PWM mode operation. Feedback is sampled during PWM OFF-time, if stpup2_lowf=0.
2	stepup12_clkinv	0	RW	Invert input clock of SU1 and SU2 converter <b>0</b> : Use positive edge of internal clk <b>1</b> : Use negative edge of internal clk
1:0	stepup2_fbprot	'b00	RW	Controls the feedback protection of SU2 with external resistor divider (regulated to 0.8V). <b>0</b> : LX_SD4 enabled as input (If SD4 not used) <b>1</b> : GPIO2 enabled as input <b>2</b> : GPIO3 enabled as input <b>3</b> : GPIO4 enabled as input

**Figure 124:**  
RTCcontrol Register (Address 60h)

Addr: 60h		RTCcontrol		
Bit	Bit Name	Default	Access	Bit Description
7:5	-	'b000	n/a	Do not use
4:3	rtc_irq_mode	'b00	RW	<b>0</b> : Generates an interrupt every second <b>1</b> : Generates an interrupt every minute <b>2</b> : Generates an interrupt every 2 minute <b>3</b> : Generates an interrupt every 8 minute
2	rtc_on	0	RW	Switch ON the 32kHz RTC oscillator <b>0</b> : 32kHz oscillator disabled <b>1</b> : 32kHz oscillator enabled
1	rtc_alarm_wakeup_en	0	RW	<b>0</b> : Disables RTC alarm wake-up in power OFF mode <b>1</b> : Enable RTC alarm wake-up in power OFF mode
0	rtc_rep_wakeup_en	0	RW	<b>0</b> : Disables RTC repeated wake-up in power OFF mode <b>1</b> : Enable RTC repeated wake-up in power OFF mode

1	ntc_10k	0	RW	Select NTC resistor type <b>0</b> : 100k $\Omega$ <b>1</b> : 10k $\Omega$
0	ntc_on	0	RW	ON/OFF control of battery NTC supervision <b>0</b> : Disabled <b>1</b> : Enabled

**Figure 149:**  
**Chargersupervision Register (Address 85h)**

Addr: 85h		Chargersupervision		
Bit	Bit Name	Default	Access	Bit Description
7	-	0	n/a	Do not use
6	ovprot_dis	0	RW	Disables external overvoltage protection, function of XOFF pin <b>0</b> : Overvoltage protection enabled <b>1</b> : Overvoltage protection disabled
5	dcdc_chmode	1	RW	Enables DCDC charger mode <b>0</b> : Linear charger mode enabled <b>1</b> : Step down charger enabled
4	charging_tmax	1	RW	<b>0</b> : Read: no time-out reached, Write: reset charger time-out counter <b>1</b> : <b>ch_timeout</b> reached and charging stopped
3:0	ch_timeout	'b0000	RW	Sets the charger time-out timer <b>0</b> : OFF <b>1</b> : 0.5 hour <b>2</b> : 1 hour <b>3</b> : 1.5 hour <b>4</b> : 2 hour <b>5</b> : 2.5 hour <b>6</b> : 3 hour <b>7</b> : 3.5 hour <b>8</b> : 4 hour <b>9</b> : 4.5 hour <b>10</b> : 5 hour <b>11</b> : 5.5 hour <b>12</b> : 6 hour <b>13</b> : 6.5 hour <b>14</b> : 7 hour <b>15</b> : 7.5 hour

**Figure 150:**  
ChargerStatus1 Register (Address 86h)

Addr: 86h		ChargerStatus1		
Bit	Bit Name	Default	Access	Bit Description
7	Nobat	0	RO	Bit is set, if no battery has been detected (after EOC measured on NTC)
6	Battemp_hi	0	RO	Bit is set, if high battery temperature has been detected
5	EOC	0	RO	Bit is set, if End of charge state has been reached
4	CVM	0	RO	Bit is set, if charger is operating in constant voltage mode
3	Trickle	0	RO	Bit is set, if charger is operating in trickle current. $V_{BAT} < 2.9V$
2	Resume	0	RO	Bit is set, if Battery voltage is below resume level
1	CCM	0	RO	Bit is set, if charger is operating in constant current mode
0	ChDet	0	RO	Bit is set when external charge adapter has been detected on pin $V_{CHARGER}$

**Figure 151:**  
ChargerStatus2 Register (Address 87h)

Addr: 87h		ChargerStatus2		
Bit	Bit Name	Default	Access	Bit Description
7:3	-	'b0000 0	n/a	Do not use
2	usb_prot_ready	0	RO	Bit indicates, that the USB input voltage protection pin $X_{OFF}$ is precharged to a voltage $> 7.5V$ $X_{OFF}$ is pull to GND if an overvoltage on $V_{USB}$ is detected.
1	batsw_on	0	RO	Bits indicates the status of the battery switch <b>00</b> : Battery switch closed <b>01</b> : Battery switch open with ideal diode <b>10</b> : Charging mode <b>11</b> : Battery switch closed
0	batsw_mode	0	RO	

**Figure 152:**  
Lock Register (Address 8eh)

Addr: 8eh		Lock		
Bit	Bit Name	Default	Access	Bit Description
7:3	-	'b0000 0	n/a	Do not use
2	charger_lock	0	RW	Enables lock of the following charger registers: 81h, 82h, 83h, Chargervoltagecontrol, Chargercurrentcontrol, Chargerconfig. Bits can only be set. Reset only with full reset cycle
1:0	reg_lock	'b00	RW	Enables lock of Regulator voltages Bits can only be set. Reset only with full reset cycle <b>0</b> : No lock <b>1</b> : Lock of voltage of LDOs (LDO1..8_vsel) (all bits) and voltage of StepDownBits(sd1..4_vsel) [5:6] only <b>2</b> : Lock voltage of StepDownbits 5:6 only (no LDOs) <b>3</b> : Lock voltage of StepDowns (all bits) and LDOs (all bits). <b>Note:</b> Setting sdx_vsel to 0 is possible all the time to allow switching OFF the regulator. Writing a non-zero value after that will restore the old value.

## Package Drawings & Markings

Figure 158:  
Package Drawings and Dimensions QFN56

**Note(s) and/or Footnote(s):**

1. Dimensions and tolerancing confirm to ASME Y14.5M-1994.
2. All dimensions are in millimeters. Angles are in degrees.
3. Coplanarity applies to the exposed heat slug as well the terminal.
4. Radius on the terminal is optional.
5. N is the total number of the terminal.

**Figure 159:**  
**Package Drawings and Dimensions CSP64**

**Note(s) and/or Footnote(s):**

1. Pin 1 = A1
2. ccc Coplanarity
3. All dimensions are in  $\mu\text{m}$

## RoHS Compliant & ams Green Statement

**RoHS:** The term RoHS compliant means that ams AG products fully comply with current RoHS directives. Our semiconductor products do not contain any chemicals for all 6 substance categories, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, RoHS compliant products are suitable for use in specified lead-free processes.

**ams Green (RoHS compliant and no Sb/Br):** ams Green defines that in addition to RoHS compliance, our products are free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material).

**Important Information:** The information provided in this statement represents ams AG knowledge and belief as of the date that it is provided. ams AG bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. ams AG has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ams AG and ams AG suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

## Copyrights & Disclaimer

Copyright ams AG, Tobelbader Strasse 30, 8141 Unterpremstaetten, Austria-Europe. Trademarks Registered. All rights reserved. The material herein may not be reproduced, adapted, merged, translated, stored, or used without the prior written consent of the copyright owner.

Devices sold by ams AG are covered by the warranty and patent indemnification provisions appearing in its General Terms of Trade. ams AG makes no warranty, express, statutory, implied, or by description regarding the information set forth herein. ams AG reserves the right to change specifications and prices at any time and without notice. Therefore, prior to designing this product into a system, it is necessary to check with ams AG for current information. This product is intended for use in commercial applications. Applications requiring extended temperature range, unusual environmental requirements, or high reliability applications, such as military, medical life-support or life-sustaining equipment are specifically not recommended without additional processing by ams AG for each application. This product is provided by ams AG "AS IS" and any express or implied warranties, including, but not limited to the implied warranties of merchantability and fitness for a particular purpose are disclaimed.

ams AG shall not be liable to recipient or any third party for any damages, including but not limited to personal injury, property damage, loss of profits, loss of use, interruption of business or indirect, special, incidental or consequential damages, of any kind, in connection with or arising out of the furnishing, performance or use of the technical data herein. No obligation or liability to recipient or any third party shall arise or flow out of ams AG rendering of technical or other services.

## Document Status

Document Status	Product Status	Definition
Product Preview	Pre-Development	Information in this datasheet is based on product ideas in the planning phase of development. All specifications are design goals without any warranty and are subject to change without notice
Preliminary Datasheet	Pre-Production	Information in this datasheet is based on products in the design, validation or qualification phase of development. The performance and parameters shown in this document are preliminary without any warranty and are subject to change without notice
Datasheet	Production	Information in this datasheet is based on products in ramp-up to full production or full production which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade
Datasheet (discontinued)	Discontinued	Information in this datasheet is based on products which conform to specifications in accordance with the terms of ams AG standard warranty as given in the General Terms of Trade, but these products have been superseded and should not be used for new designs

## Revision Information

Changes from 1.2 (2012-May) to current revision 1-34 (2014-Nov-10)	Page
Content of austriamicrosystems datasheet was updated to latest <b>ams</b> design	
Added CSP package information to the datasheet	
Added benefits and CSP package to Figure 1	2
Updated QFN blockdiagram (Figure 2)	4
Added CSP block diagram (Figure 3)	5
Added Ball Assignment CSP (Figure 5)	7
Added CSP ball info. and updated pins VINLDO78, XRES, VINLDO456 & VSSA (Figure 6)	7
Updated Figure 7	11
Added $C_{load\_LDO3-8\_L}$ & $C_{load\_LDO3-8\_H}$ parameters to Figure 28	29
Added $I_{out}$ to Figure 29	31
Updated text under DCDC Step-Up Converter	32
Renamed VFB2 to VCURR in Figure 35	38
Updated $I_{CURR1,2,3}$ in Figure 39 and text under Current Sinks	40
Updated text under Charger	41
Updated text under NTC supervision	45
Updated Figure 51	53
Renamed VXRES to VRES in Figure 52	54
Updated Figure 54	57
Updated descriptions of IO Functions	59
Updated sections Vselect Input & Stand-by and Vselect input	60
Updated Figure 62	67
Updated description of Real Time Clock	69
Replaced $osc\_pd=1$ with $rtc\_on=0$ in GPIO1-,GPIO2-,GPIO3-, GPIO4- control registers	86 - 89
Replaced $osc\_pd=1$ with $rtc\_on=0$ in curr_control register	105
Changed 0.15mA to 0.1562mA and 38.25 to 39.84 in curr1-,curr2-, curr3_value registers	106 - 107
Updated bit 6 in Chargersupervision register	126

Changes from 1.2 (2012-May) to current revision 1-34 (2014-Nov-10)	Page
Updated ASIC_ID2 Register	128
Updated Figure 159	133
Updated Figure 160 & Figure 161	134
Updated Figure 163	135

**Note(s) and/or Footnote(s):**

1. Page and figure numbers for the previous version may differ from page and figure numbers in the current revision.
2. Correction of typographical errors is not explicitly mentioned.
