## 15-CH PROGRAMMABLE CAPACITIVE TOUCH SENSOR

July 2019

### GENERAL DESCRIPTION

The IS31SE5111 is an ultra-low power, fully integrated 15-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric such as glass or plastic. On-chip calibration logic continuously monitors the environment and automatically adjusts on-and-off threshold levels to prevent false sensor activation.

The IS31SE5111 supports the 400kHz I<sup>2</sup>C serial bus data protocol and includes a field programmable slave address. An INTB is generated when a button event (touched or released) occurs, triggered and cleared condition could be configured by setting the interrupt register.

Many peripheral functions are also embedded in the chip such as UART, EUART with LIN capability, one I2C master/slave and two I2C pure slave controllers, one SPI master/slave controller, PWMs, GPIOs, etc. Unused touch key pins can be programmed for selected I/O function. User can refer to the Technical Reference Manual, TRM-5111\_R1 for detail.

IS31SE5111 is available in TSSOP-16 and TSSOP-24 package. It operates from 2.7V to 5.5V over the temperature range of -40°C to +105°C.

### FEATURES

- Fifteen sensors capacitive touch controller with readable key value through shared GPIO
- Individual sensitivity threshold setting for each key
- Optional multiple-key function
- Press and hold function
- Automatic calibration
- Individual key calibration
- Interrupt output with auto-clear and repeating
- Auto sleep mode for extremely low power
- Keys wake up from sleep mode
- 400kHz fast-mode I<sup>2</sup>C interface
- One SPI master/slave controllers
- One 8051 UART
- One full-duplex LIN-capable EUART2
- Operating temperature is -40°C ~ +105°C
- TSSOP-16 and TSSOP-24 package

### APPLICATIONS

- Home appliance control keys
- Industrial touch keys

### TYPICAL APPLICATION CIRCUIT (TSSOP-24)

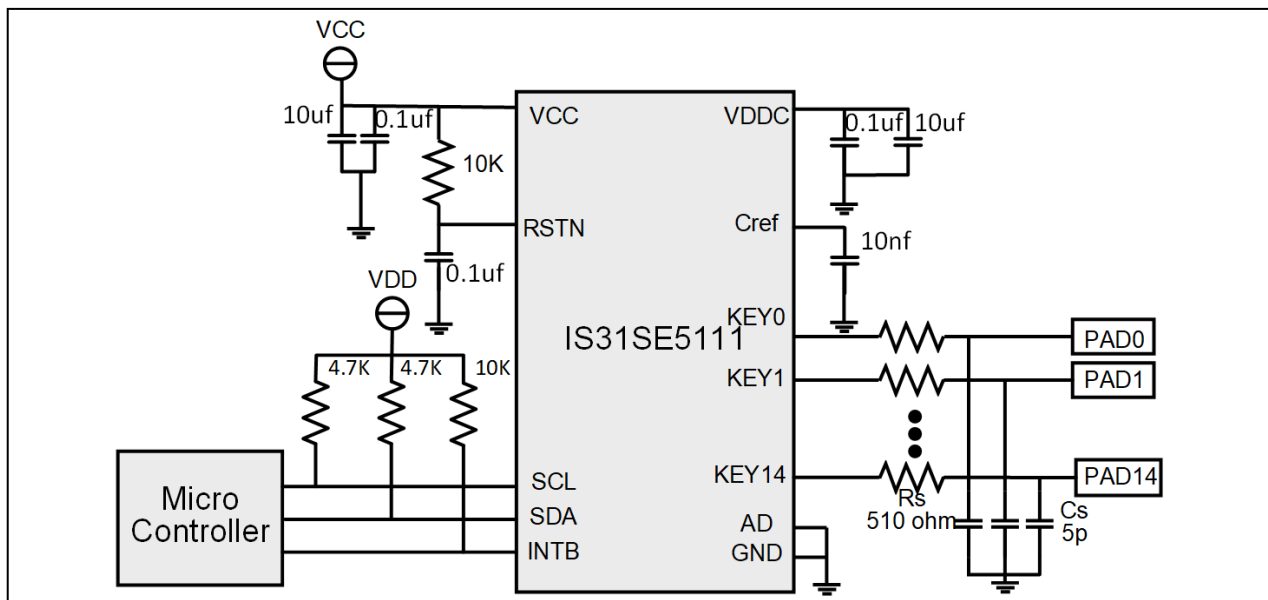

Figure 1 Typical Application Circuit (TSSOP-24)

**Note 1:** The IC should be placed far away from the noise points in order to prevent the EMI.

**Note 2:** The R<sub>s</sub> and C<sub>s</sub> should place as close to IC as possible to reduce EMI.

## DETAILED DESCRIPTION

### I2C INTERFACE

The IS31SE5111 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31SE5111 has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

**Table 1 Slave Address**

Bit	A7:A3	A2:A1	A0
Value	01111	AD	1/0

- AD connected to GND, AD = 00;
- AD connected to VCC, AD = 11;
- AD connected to SCL, AD = 01;
- AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS31SE5111.

The timing diagram for the I2C is shown in Figure 2. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31SE5111's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31SE5111 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

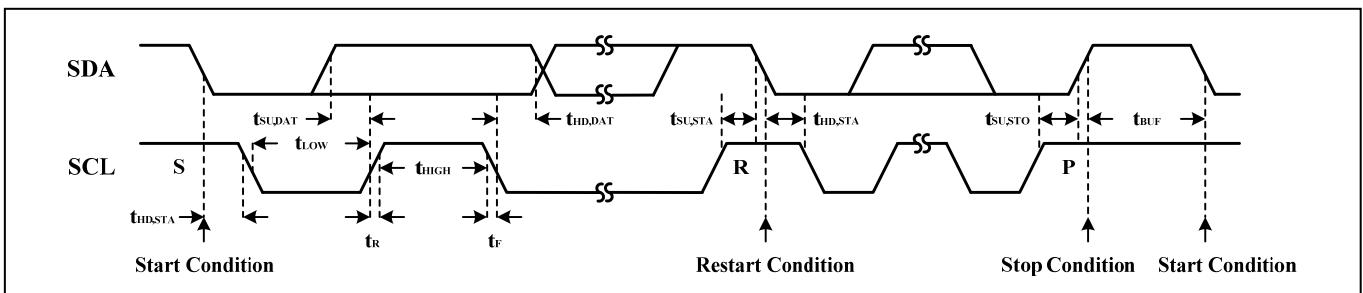

Following acknowledge of IS31SE5111, the register address byte is sent, most significant bit first. IS31SE5111 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31SE5111 must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

### READING PORT REGISTERS

To read the device data, the bus master must first send the IS31SE5111 address with the R/W bit set to "0", followed by the command byte, which determines which register is accessed. After a restart, the bus master must then send the IS31SE5111 address with the R/W bit set to "1". Data from the register defined by the command byte is then sent from the IS31SE5111 to the master (Figure 5).

## IS31SE5111 GUI

IS31SE5111 GUI is a windows-based Integrated Design Environment (IDE). User can use it to develop touch key applications without firmware coding. With the GUI user can design the touch key system easily. With the GUI you can:

1. Monitor the Key value
2. Set touch threshold and enable keys
3. Switch the operating modes
4. Tune System parameters

## FUNCTIONAL DEFINITION of KEY PERIPHERALS

The IS31SE5111 is a capacitive touch-sensing controller with MCU. The MCU is based on 1-T 8051 core. Embedded in the MCU core are also a full-duplex UART port, an enhanced EUART port with LIN capability, one I2C master/slave and two I2C pure slave controllers, one SPI master/slave controller, up to 20 GPIO pins

### GPIO

Each GPIO is controlled by two registers. One is IOCFGPx.y (I/O Configuration) and the other is MFCFGPx.y (Multifunction Configuration).

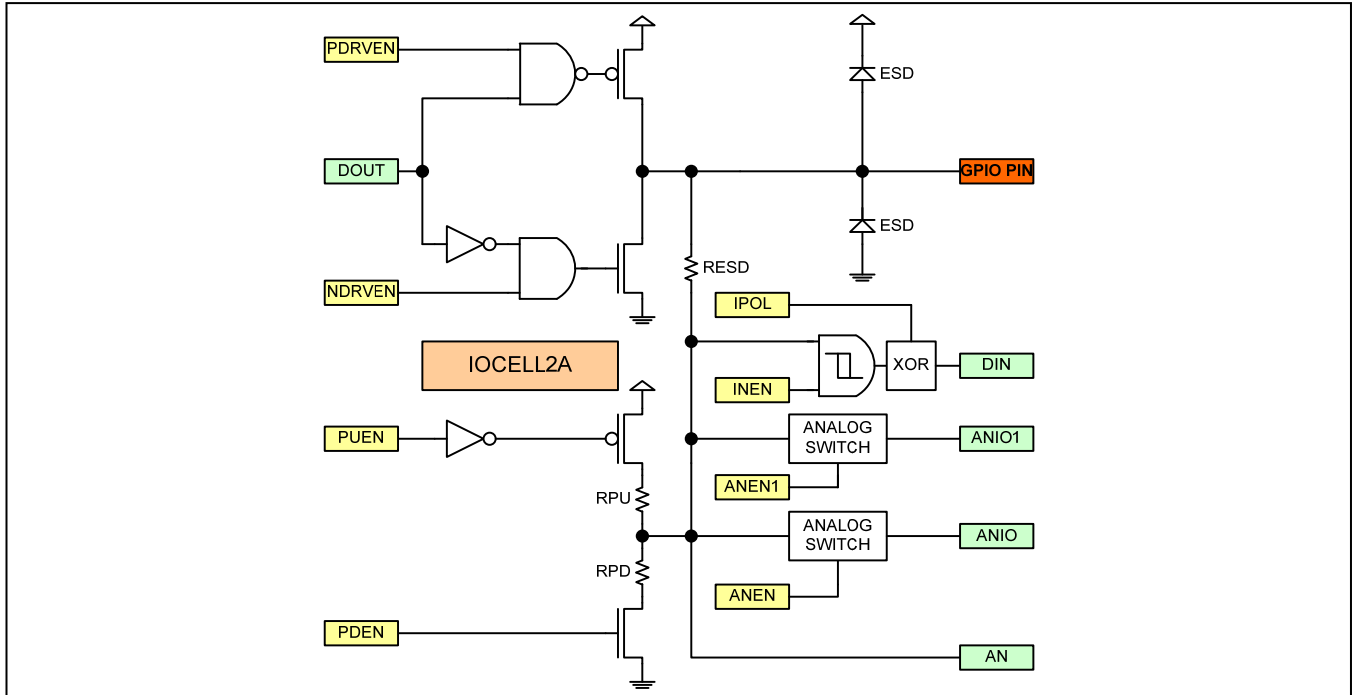

Figure 6 I/O Configuration

Figure 6 shows that there are 7 control bits for the IOCFGPx.y register, and these registers are located at XFR 0xA040 – 0xA047 for P0.0 to P0.7, 0xA048 – 0xA04F for P1.0 to P1.7, 0xA060 – 0xA063 for P2.0 to P2.3.

### GPIO Port Multi-Function

Each signal pin is multi-functional and the pin configuration is specified by MFCFGP register. There are 7 control bits for the MFCFGPx.y register, and these registers are located at XFR 0xA050 – 0xA057 for P0.0 to P0.7, 0xA058 – 0xA05F for P1.0 to P1.7, and 0xA070 – 0xA073 for P2.0 to P2.3

The touch keys and GPIO mapping table are as follows:

Touch KEY No.	GPIO Port
KEY0	P0.5
KEY1	P0.6
KEY2	P0.7
KEY3	P1.0
KEY4	P1.1
KEY5	P1.2

## Serial Port – UART0

UART0 is full duplex and fully compatible with the standard 8052 UART. The receive path of UART0 is double-buffered that can commence reception of second byte before previously received byte is read from the receive register. Writing to SBUF0 loads the transmit register while reading SBUF0, reads a physically separate receive register. The UART0 can operate in four modes.

The touch keys related function and UART0 pins mapping table are as follows:

Touch KEY No.	GPIO Port
KEY3	P1.0/RX0
KEY4	P1.1/TX0

To use UART0 function, IOCFGP1.0, IOCFGP1.1, MFCFGP1.0, and MFCFGP1.1 should be defined in advance to enable UART0.

MFCFGP1.0	0x20 (input only)
MFCFGP1.1	0x20 (output pin)

## EUART2 with LIN Controller (EUART2)

LIN-capable 16550-like EUART2 is an enhanced UART controller (EUART) with separate transmit and receive FIFO. Both transmit and receive FIFO are 15-byte deep and can be parameterized for interrupt triggering. The addition of FIFO significantly reduces the CPU load to handle high-speed serial interface. Transmit FIFO and

# IS31SE5111

receive FIFO have respective interrupt trigger levels that can be set based on optimal CPU performance adjustment. EUART2 also has dedicated 16-bit Baud Rate generator and thus provides accurate baud rate under wide range of system clock frequency. EUART2 also provides LIN extensions that incorporate message handling and baud-rate synchronization. The block diagram of EUART2 is shown in the following.

EUART2 can be configured to add LIN capability. The major enhancement of LIN includes master/slave configurations, auto baud-rate synchronization, and frame-based protocol with header. Under LIN extension mode, all EUART2 registers and functions are still effective and operational. LIN is a single-wire bus and it requires external components to combine RX and TX signals externally. LIN is frame based and consists of message protocols with master/slave configurations.

The touch keys related function and UART2/LIN pins mapping table are as follows:

Touch KEY No.	GPIO Port
KEY3	P1.0/RX2
KEY4	P1.1/TX2

# IS31SE5111

To use UART0 function, IOCFGP1.0, IOCFGP1.1, MFCFGP1.0, and MFCFGP1.1 should be defined in advance to enable UART0.

MFCFGP1.0	0x40 (input only)
MFCFGP1.1	0x40 (output pin)

## Serial Peripheral Interface (SPI)

The Serial Peripheral Interface (SPI) is an enhanced synchronous serial hardware which is compatible with Motorola's SPI specifications. The SPI Controller includes 4-byte FIFO for both transmit and receive. SPI Interface uses Master-Out-Slave-In (MOSI), Master-In-Slave-Out (MISO), Serial Clock (SCK) and Slave Select (SSN) for interface. SSN is low active and only meaningful in slave mode.

The touch keys related function and SPI pins mapping table are as follows:

Touch KEY No.	GPIO Port

## PWM0/PWM1 Controller

PWM0/1 controller provides an 8-bit programmable duty cycle output. The counting clock of PWM0/1 is programmable and the base frequency of the PWM0/1 is just the counting clock divided by 256. The duty cycle setting is always double buffered. PWM0 output is connected to only one of the pins: P04, P06, P12, P17 or P23. PWM1 output is connected to only one of the pins: P05, P13, P15, P16 or P22.

The frequency of the counting clock is  $\text{SYSCLK}/\text{CS}[7-5]/(\text{CS}[4-0]+1)$ . The frequency of the PWM clock is counting clock divided by 256. Assuming SYSCLK is 16MHz, and we want the PWM base frequency of 120Hz. First, we get  $16\text{MHz}/120\text{Hz}/256 = 520.8$ . Where 520.8 needs to be separated as two multiplicands of CS[7-5] and CS[4-0]. Then by trial and error we can select CS[7-5] = 100, and CS[4-0] = 0x0F. This gives  $16\text{MHz}/256/32/(15+1) = 122\text{Hz}$ .

PWM0DTY registers define the PWM0 duty cycle. The maximum duty cycle is 254/255. PWM0DTY is always double buffered and is loaded to duty cycle comparator when the current counting cycle is completed.

The touch keys related function and PWM0/PWM1 pins mapping table are as follows:

Touch KEY No.	GPIO Port
SDA, KEY1, KEY5, KEY10, KEY14	P0.4, P0.6, P1.2, P1.7, P2.3 (PWM0)
KEY0, KEY6, KEY8, KEY9, KEY13	P0.5, P1.3, P1.5, P1.6, P2.2 (PWM1)

When set the INM as 1 and several keys are pressed, it will generate the second interrupt until M\_PRESS\_TIME after the first interrupt. Then wait for INT\_RPT\_TIME to trigger the third interrupt. After all of these if the keys are still pressing, wait for INT\_RPT\_TIME to trigger others interrupt until keys release.

## TYPICAL APPLICATION INFORMATION

### GENERAL DESCRIPTION

The IS31SE5111 is an ultra low power, fully integrated 15-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric such as glass or plastic.

### SENSITIVITY ADJUSTING

Sensitivity can be adjusted by the external capacitor or internal register.

The value of capacitor is higher the sensitivity is lower; value of capacitor is lower the sensitivity is higher.

### INTERRUPTION

The changing of action can be signed by the INTB pin. The INTB pin will be pulled low when sensitivity channel is pressed or released.

### SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

#### Software Shutdown

By setting SDM bit of the Configuration Register (00h) to "1", the IS31SE5111 will operate in software shutdown mode.
