(Pinout A only)**

Vcc = Pin 5
GND = Pin 10

DESCRIPTION — The '91 is a serial-in, serial-out, 8-bit shift register. It is composed of eight RS master/slave flip-flops, input gating and a clock driver. The register is capable of storing and transferring data at clock rates up to 18 MHz while maintaining a typical noise immunity level of 1.0 V.

ORDERING CODE: See Section 9

PIN NAMES	DESCRIPTION	54/74 (U.L.) HIGH/LOW
A, B	Serial Data Inputs	1.0/1.0
CP	Clock Pulse Input (Active Rising Edge)	1.0/1.0
Q7	Data Output	10/10
Q7-bar	Complementary Data Output	10/10

FUNCTIONAL DESCRIPTION — Single-rail data and input control are gated through inputs A and B and an internal inverter to form the complementary inputs to the first bit of the shift register. Drive for the internal common clock line is provided by an inverting clock driver. Each of the inputs (A, B, and CP) appear as only one TTL input load. The clock pulse inverter/driver causes these circuits to shift information to the output on the positive edge of an input clock pulse, thus enabling the shift register to be fully compatible with other edge-triggered synchronous functions.
