**Multilevel Pipeline Register**

### Features

- Four 8-Bit Registers
- Hold, Transfer and Load Instructions
- Single 4-Stage or Dual-2 Stage Pipelining
- All Register Contents Available at Output
- Fully TTL Compatible
- Three-State Outputs
- High Speed, Low Power CMOS
- Available in 24 Pin Dual-In-Line and SOIC Packages

### Applications

- Array Processor
- Digital Signal Processor
- A/D Buffer
- Telecommunication
- Byte Wide Shift Register
- Mainframe Computers

### Description

These devices are multilevel pipeline registers implemented using a low power CMOS process. They are pin for pin compatible replacements for industry standard multilevel pipeline registers such as the L29C520 and L29C521. The HSP9520 and HSP9521 are direct replacements for the AM29520/21 and WS59520/21.

They consist of four 8-bit registers which are dual ported. They can be configured as a single four level pipeline or a dual two level pipeline. A single 8-bit input is provided, and the pipelining configuration is determined by the instruction code input to the I0 and I1 inputs (see instruction control).

The contents of any of the four registers is selectable at the multiplexed outputs through the use of the S0 and S1 multiplexer control inputs (see register select). The output is 8-bits wide and is three-stated through the use of the OE# input.

The '9520 and '9521 differ only in the way data is loaded into and between the registers in dual two-level operation. In the '9520, when data is loaded into the first level the existing data in the first level is moved to the second level. In the '9521, loading the first level simply causes the current data to be overwritten. Transfer of data to the second level is achieved using the single four level mode (I1, I0 = '0'). This instruction also causes the first level to be loaded. The HOLD instruction (I1, I0 = '1') provides a means of holding the contents of all registers.

**Pin Descriptions**

NAME	DIP PIN	TYPE	DESCRIPTION
VCC	24		The +5V power supply pin. A 0.1µF capacitor between the VCC and GND pin is recommended.
GND	12		The device ground.
CLK	11	I	Input Clock. Data is latched on the low to high transition of this clock signal. Input setup and hold times with respect to the clock must be met for proper operation.
D0-7	3-10	I	Data Input Port. These inputs are used to supply the 8 bits of data which will be latched into the selected register on the next rising clock edge.
Y0-7	21-14	O	Data Output Port. This 8-bit port provides the output data from the four internal registers. They are provided in a multiplexed fashion, and are controlled via the multiplexer control inputs (S0 and S1).
I0, I1	1, 2	I	Instruction Control Inputs. These inputs are used to provide the instruction code which determines the internal register pipeline configuration. Refer to the Instruction Control Table for the specific codes and their associated configurations.
S0, S1	23, 22	I	Multiplexer Control Inputs. These inputs select which of the four internal registers' contents will be available at the output port. Refer to the Register Select Table for the codes to select each register.
OE#	13	I	Output Enable. This input controls the state of the output port (Y0-Y7). A LOW on this control line enables the port for output. When OE# is HIGH, the output drivers are in the high impedance state. Internal latching or transfer of data is not affected by this pin.

**NOTES:**

1. Refer to applicable symbol list.
2. Dimensioning and tolerancing per ANSI Y14.5M-1982.
3. Dimension "D" does not include mold flash, protrusions or gate burrs. Mold flash, protrusion and gate burrs shall not exceed 0.15mm (0.006 inch) per side.
4. Dimension "E" does not include interlead flash or protrusions. Interlead flash and protrusions shall not exceed 0.25mm (0.010 inch) per side.
5. The chamfer on the body is optional. If it is not present, a visual index feature must be located within the crosshatched area.
6. "L" is the length of terminal for soldering to a substrate.
7. "N" is the number of terminal positions.
8. Terminal numbers are shown for reference only.
9. The lead width "B", as measured 0.36mm (0.014 inch) or greater above the seating plane, shall not exceed a maximum value of 0.61mm (0.024 inch)
10. Controlling dimension: Millimeter. Converted inch dimensions are not necessarily exact.

**NOTES:**

- Controlling Dimensions: Inch. In case of conflict between English and Metric dimensions, the inch dimensions control.
- Dimensioning and tolerancing per ANSI Y14.5M-1982.
- Symbols are defined in the "MO Series Symbol List" in Section 2.2 of Publication No. 95.
- Dimensions A, A1 and L are measured with the package seated in JEDEC seating plane gauge GS-3.
- D and E1 dimensions do not include mold flash or protrusions. Mold flash or protrusions shall not exceed 0.010 inch (0.25mm).
- E and  $e_A$  are measured with the leads constrained to be perpendicular to plane C.
- $e_B$  and  $e_C$  are measured at the lead tips with the leads unconstrained.  $e_C$  must be zero or greater.
- N is the maximum number of terminal positions.
- Corner leads (1, N, N/2 and N/2 + 1) may be configured as shown in Figure 2.
