

January 1994

Histogrammer/Accumulating Buffer

Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- 10-Bit Pixel Data
- 4k x 4k Frame Sizes
- Asynchronous Flash Clear Pin
- Fully Asynchronous 16-Bit or 24-Bit Host Interface
- DC to 33MHz Clock Rate

Applications

- Histogramming
- Histogram Equalization
- Image and Signal Analysis

Ordering Information

PART NUMBER	TEMPERATURE RANGE	PACKAGE
HSP48410GM-33/883	-55°C to +125°C	84 Lead PGA
HSP48410GM-25/883	-55°C to +125°C	84 Lead PGA

Description

The Harris HSP48410 is an 84 lead Histogrammer IC intended for use in image and signal analysis. The on board memory is configured as 1024 x 24 array. This translates to a pixel resolution of 10-bits and an image size of 4k x 4k with no possibility of overflow.

In addition to Histogramming, the HSP48410 can generate and store the Cumulative Distribution Function for use in Histogram Equalization applications. Other capabilities of the HSP48410 include: Bin Accumulation, Look Up Table, 24-bit Delay memory, and Delay and Subtract mode.

A Flash Clear pin is available in all modes of operation and performs a single cycle reset on all locations of the internal memory array and all internal data paths.

The HSP48410 includes a fully asynchronous interface which provides a means for communications with a host, such as a microprocessor. The interface includes dedicated Read/Write pins and an address port which are asynchronous to the system clock. This allows random access of the Histogram Memory Array for analysis or conditioning of the stored data.

Block Diagram

CAUTION: These devices are sensitive to electrostatic discharge. Users should follow proper I.C. Handling Procedures.

Pin Description

SYMBOL	PIN NUMBER	TYPE	DESCRIPTION
CLK	C6	I	Clock input. This input has no effect on the chips functionality when the chip is programmed to an asynchronous mode. All signals denoted as synchronous have their timing specified with reference to this signal.
PIN0-9	A1-5, A7, B3-5, C5	I	Pixel Input. This input bus is sampled by the rising edge of clock. It provides the on chip RAM with address values in Histogram, Bin Accumulate and LUT(write) mode. During Asynchronous modes it is unused.
LD#	C1	I	The Load pin is used to load the FCT0-2 bits into the FCT registers. (See below).
FCT0-2	D1-2, E3	I	These three pins are decoded to determine the mode of operation for the chip. The signals are sampled by the rising edge of LD# and take effect after the rising edge of LD#. Since the loading of this function is asynchronous to CLK, it is necessary to disable the START# pin during loading and enable START# at least 1 CLK cycle following the LD# pulse.
START#	B1	I	This pin informs the on chip circuitry which clock cycle will start and/or stop the current mode of operation. Thus, the modes are asynchronously selected (via LD#) but are synchronously started and stopped. This input is sampled by the rising edge of CLK. The actual function of this input depends on the mode that is selected. START# must always be held high (disabled) when changing modes. This will provide a smooth transition from one mode to the next by allowing the part to reconfigure itself before new mode begins. When START# is high, LUT(read) mode is enabled except for Delay and Delay and Subtract modes.
FC#	B2	I	Flash Clear. This input provides a fully asynchronous signal which effectively resets all bits in the RAM Array and the input and output data paths to zero.
DIN0-23	A8-11, B6-11, C10-11, D10-11, E9-11, F10-11, G9-11, H10-11	I	Data input bus. Provides data to the Histogrammer during Bin Accumulate, LUT, Delay and Delay and Subtract modes. Synchronous to CLK.
DIO0-23	J5-7, J10-11, K2-11, L2-4, L6-11	I/O	Asynchronous data bus. Provides RAM access for a microprocessor in preconditioning the memory array and reading the results of the previous operation. Configurable as either a 24-bit or 16-bit bus
IOADD0-9	F1,F3,G1-3, H1-2, J1-2,K1	I	RAM address in asynchronous modes. Sampled on the falling edge of WR# or RD#.
UWS	F2	I	Upper Word Select. In 16-bit Asynchronous mode, a one on this pin denotes the contents of DIO0-7 as being the upper eight-bits of the data in or out of the Histogrammer. A zero means that DIO0-15 are the lower 16-bits. In all other modes, this pin has no effect.
WR#	E2	I	Write enable to the RAM for the data on DIO0-23 when the HSP48410 is configured in one of the asynchronous modes. Asynchronous to CLK.
RD#	C2	I	Read control for the data on DIO0-23 in asynchronous modes. Output enable for DIO0-23 in other modes. Asynchronous to CLK.
VCC	A6, L1		+5V
GND	C7, E1, F9, L5		Ground

Specifications HSP48410/883

Absolute Maximum Ratings

Supply Voltage	+8.0V
Input, Output Voltage	GND -0.5V to $V_{CC} + 0.5V$
Storage Temperature	-65°C to +150°C
Junction Temperature	+175°C
Lead Temperature (Soldering 10s)	+300°C
ESD	Class 1

Reliability Information

Thermal Resistance	θ_{JA}	θ_{JC}
Ceramic PGA Package	34.3°C/W	8.0°C/W
Maximum Package Power Dissipation at +125°C		
Ceramic PGA Package	1.46 Watt	
Gate Count	3500 Gates	

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

Operating Conditions

Operating Voltage Range	+4.5V to +5.5V
Operating Temperature Range	-55°C to +125°C

TABLE 1. DC ELECTRICAL SPECIFICATIONS

Device Guaranteed and 100% Tested

PARAMETER	SYMBOL	CONDITIONS	GROUP A SUBGROUP	TEMPERATURE	MIN	MAX	UNITS
Logical One Input Voltage	V_{IH}	$V_{CC} = 5.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	2.2	-	V
Logical Zero Input Voltage	V_{IL}	$V_{CC} = 4.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	0.8	V
High Level Clock Input	V_{IHC}	$V_{CC} = 5.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	3.0	-	V
Low Level Clock Input	V_{ILC}	$V_{CC} = 4.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	0.8	V
Output High Voltage	V_{OH}	$I_{OH} = -400\mu A$, $V_{CC} = 4.5V$ (Note 1)	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	2.6	-	V
Output Low Voltage	V_{OL}	$I_{OL} = +2.0mA$, $V_{CC} = 4.5V$ (Note 1)	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	0.4	V
Input Leakage Current	I_L	$V_{IN} = V_{CC}$ or GND, $V_{CC} = 5.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-10	10	μA
I/O Leakage Current	I_O	$V_{OUT} = V_{CC}$ or GND, $V_{CC} = 5.5V$	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-10	10	μA
Standby Supply Current	I_{CCSB}	$V_{IN} = V_{CC}$ or GND, $V_{CC} = 5.5V$, Outputs Open	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	500	μA
Operating Power Supply Current	I_{CCOP}	$f = 25.6MHz$, $V_{IN} = V_{CC}$ or GND $V_{CC} = 5.5V$ (Note 2)	1, 2, 3	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	308	mA
Functional Test	FT	(Notes 3,4)	7, 8	$-55^{\circ}C \leq T_A \leq +125^{\circ}C$	-	-	-

NOTES:

1. Interchanging of force and sense conditions is permitted.
2. Power Supply current is proportional to operating frequency. Typical rating for I_{CCOP} is 12mA/MHz. Maximum junction temperature must be considered when operating part at high clock frequencies.
3. Tested as follows: $f = 1MHz$, $V_{IH} = 2.6V$, $V_{IL} = 0.4V$, $V_{OH} \geq 1.5V$, $V_{OL} \leq 1.5V$, $V_{IHC} = 3.4V$ and $V_{ILC} = 0.4V$.
4. Loading is as specified in the test load circuit with $C_L = 40pF$.

Specifications HSP48410/883

NOTES:

1. A.C. Testing is performed as follows: Input levels (CLK) 0.0V and 4.0V; Input levels (All other inputs) 0V and 3.0V. Timing reference levels (CLK) = 2.0V, (All others) = 1.5V. Output load circuit with $C_L = 40pF$. Output transition measured at $V_{OH} \geq 1.5V$ and $V_{OL} \geq 1.5V$.
2. There must be at least one rising edge of CLK between the rising edge of LD# and the falling edge of START#.
3. Transition is measured at ± 200 mV from steady state voltage with loading as specified in test load circuit with $C_L = 40pF$.
