

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

Continuity of Specifications

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

Continuity of Ordering Part Numbers

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

For More Information

Please contact your local sales office for additional information about Cypress products and solutions.

About Cypress

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM™ and SRAM, Traveo™ microcontrollers, the industry's only PSoC® programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense® capacitive touch-sensing controllers, and Wireless BLE Bluetooth® Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

BIPOLAR

SWITCHING REGULATOR CONTROLLER

MB3769A

■ DESCRIPTION

The Fujitsu Microelectronics MB3769A is a pulse-width-modulation controller which is applied to fixed frequency pulse modulation technique. The MB3769A contains wide band width Op-Amp and high speed comparator to construct very high speed switching regulator system up to 700 kHz. Output is suitable for power MOS FET drive owing to adoption of totem pole output.

The MB3769A provides stand-by mode at low voltage power supply when it is applied in primary control system.

■ FEATURES

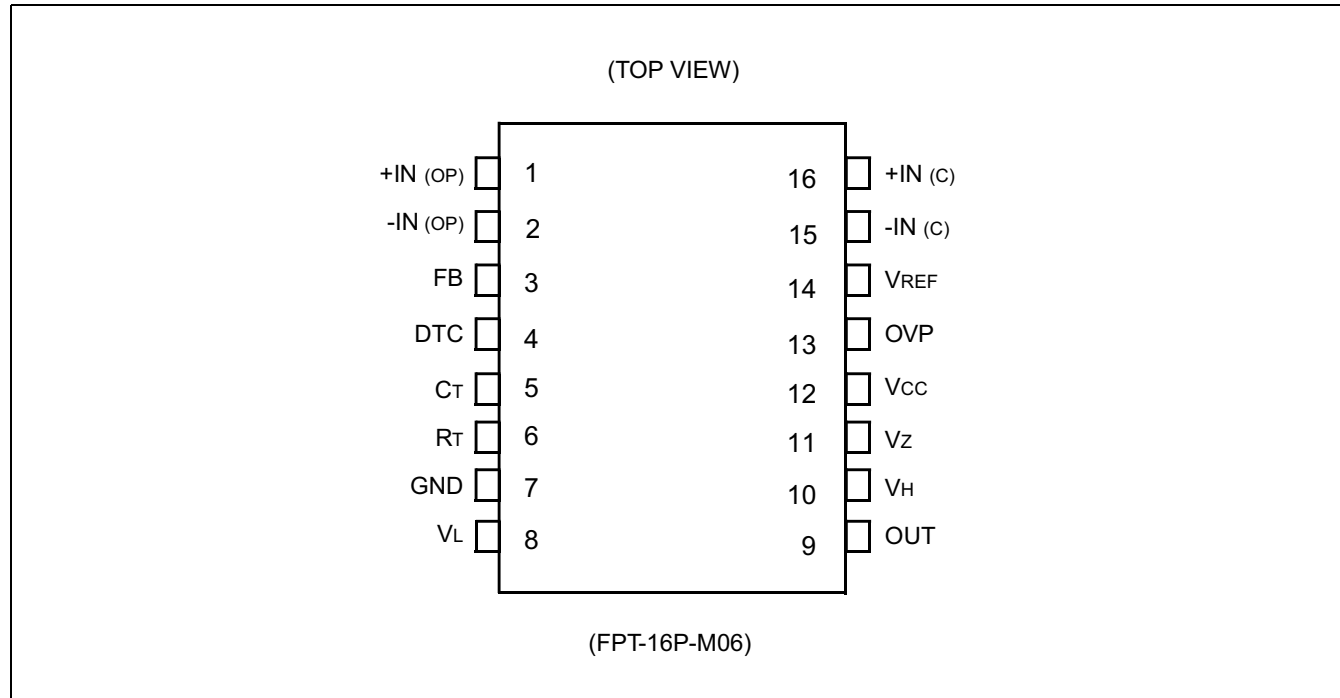

- High frequency oscillator ($f = 1 \text{ kHz to } 700 \text{ kHz}$)
- On-chip wide band frequency operation amplifier ($BW = 8 \text{ MHz Typ}$)
- On-chip high speed comparator ($t_d = 120 \text{ ns Typ}$)
- Internal reference voltage generator provides a stable reference supply ($5 \text{ V} \pm 2\%$)
- Low power dissipation (1.5 mA Typ at standby mode, 8 mA Typ at operating mode)
- Output current $\pm 100 \text{ mA}$ ($\pm 600 \text{ mA}$ at peak)
- High speed switching operation ($t_r = 60 \text{ ns}$, $t_f = 30 \text{ ns}$, $C_L = 1000 \text{ pF Typ}$)
- Adjustable Dead-time
- On-chip soft start and quick shut down functions
- Internal circuitry prohibits double pulse at dynamic current limit operation
- Under voltage lock out function (OFF to ON: 10 V Typ , ON to OFF: 8 V Typ)
- On-chip output shut down circuit with latch function at over voltage
- On-chip Zener diode (15 V)
- One type of package (SOP-16pin : 1 type)

■ APPLICATIONS

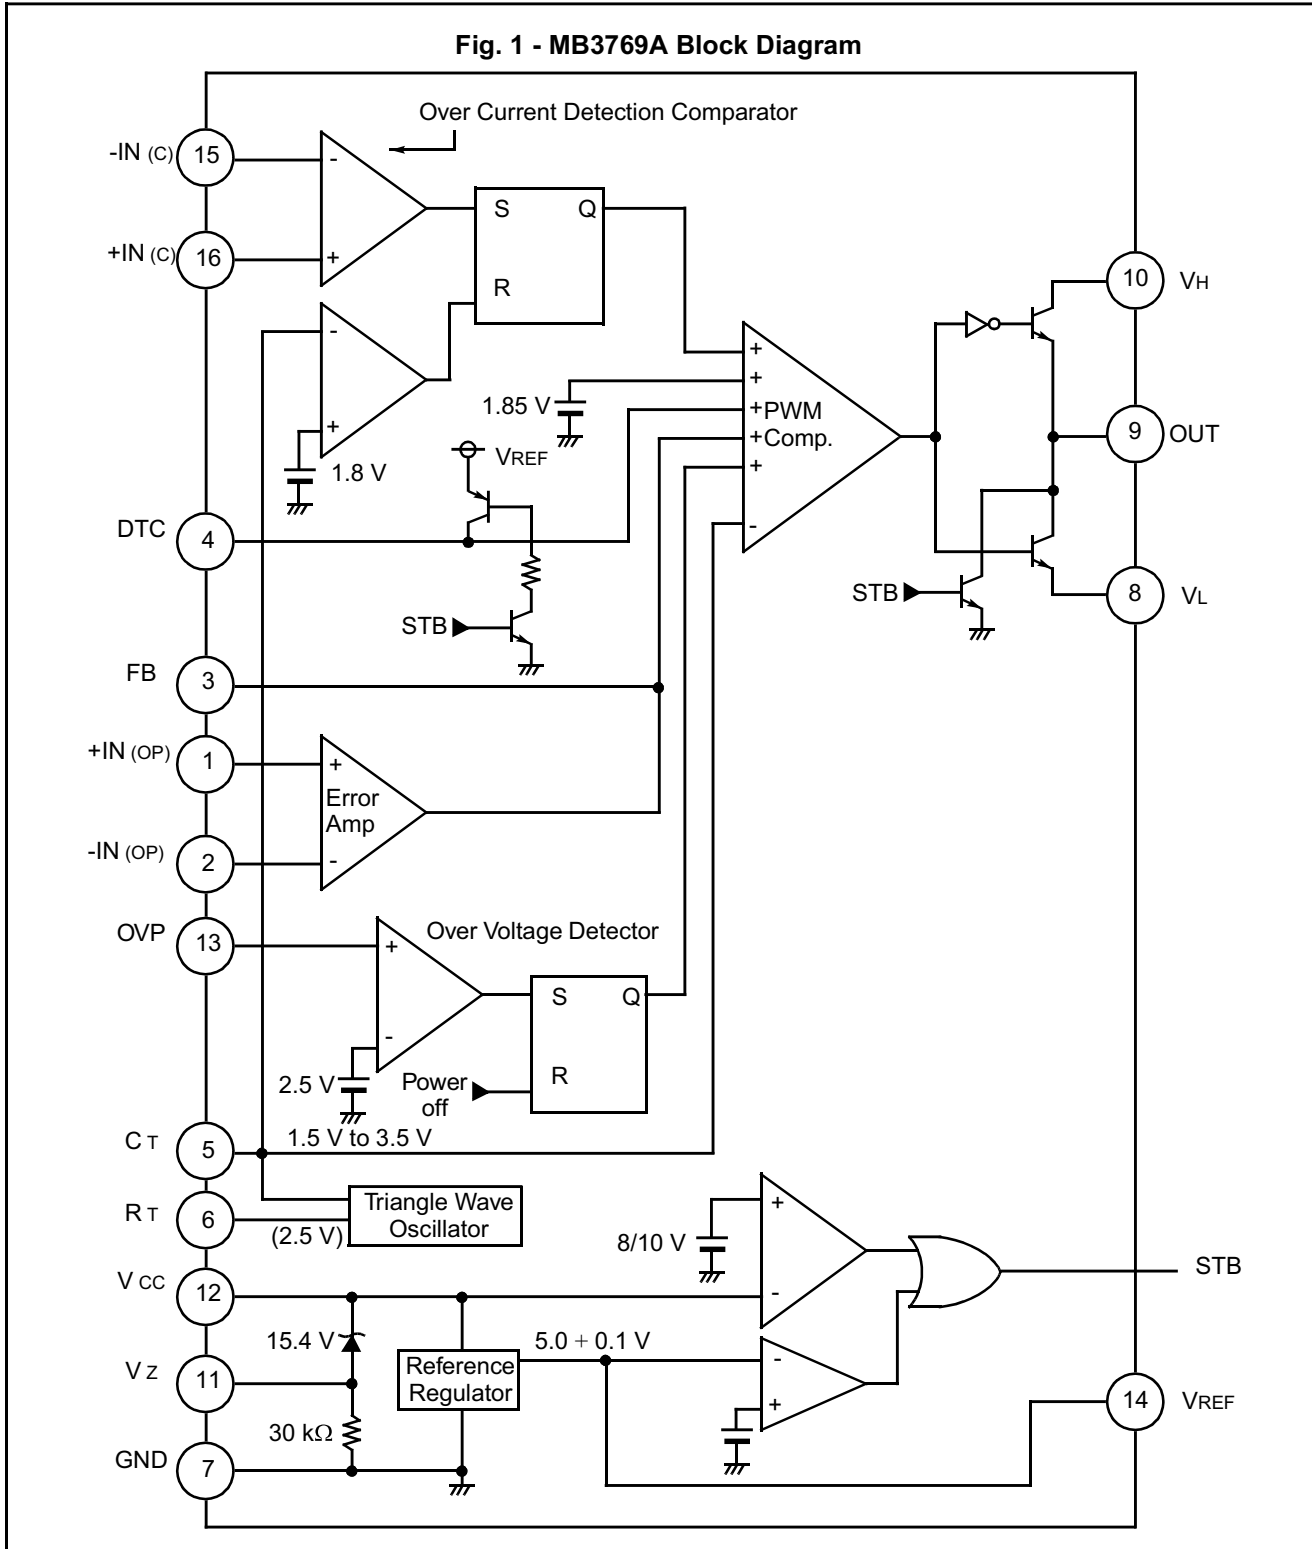

- Power supply module
- Industrial Equipment
- AC/DC Converter etc.

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating		Unit
		Min	Max	
Power Supply Voltage	V _{CC}	—	20	V
Output Current	I _{OUT}	—	120 (660*1)	mA
Operation Amp Input Voltage	V _{in (OP)}	—	V _{CC} + 0.3 (≤ 20)	V
Power Dissipation : SOP	P _D	—	620*2	mW
Storage Temperature	T _{STG}	-55	+125	°C

*1 : Duty ≤ 5%

*2 : T_a = + 25 °C, SOP package is mounted on the epoxy board. (4 cm x 4 cm x 0.15 cm)

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	SOP package			Unit
		Min	Typ	Max	
Power Supply Voltage	V _{CC}	12	15	18	V
Output Current (DC)	I _{OUT}	-100	-	+100	mA
Output Current (Peak)	I _{OUT PEAK}	-600	-	+600	mA
Operation Amp Input voltage	V _{INOP}	-0.2	0 to V _{REF}	V _{CC} -3	V
FB Sink Current	I _{SINK}	-	-	0.3	mA
FB Source Current	I _{SOURCE}	-	-	2	mA
Comparator Input Voltage	V _{INC⁺}	-0.3	0 to 3	V _{CC}	V
	V _{INC⁻}	-0.3	0 to 2	2.5	V
Reference Section Output Current	I _{REF}	-	2	10	mA
Timing Resistor	R _T	9	18	50	kΩ
Timing Capacitor	C _T	100	680	10 ⁶	pF
Oscillator Frequency	f _{OSC}	1	100	700	kHz
Zener Current	I _Z	-	-	5	mA
Operating Ambient Temperature: SOP	T _a	-30	+25	+75	°C

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

MB3769A

Fig. 2 - MB3769A Test Circuit

MB3769A

FUNCTIONS

1. Error Amplifier

The error amplifier detects the output voltage of the switching regulator.

The error amplifier uses a high-speed operational amplifier with an 8 MHz bandwidth (typical) and 6 V/ μ s slew rate (typical). For ease of use, the common mode input voltage ranges from -0.2 V to $V_{CC}-3$ V. Figure 4 shows the equivalent circuit.

2. Overcurrent Detection Comparator

There are two methods for protection of the output transistor of this device from overcurrents; one restricts the transistor's on-time if an overcurrent that flows through the output transistor is detected from an average output current, and the other detects an overcurrent in the external transistor (FET) and shuts the output down instantaneously. Using average output currents, the peak current of the external transistor (FET) cannot be detected, so an output transistor with a large safe operation area (SOA) margin is required.

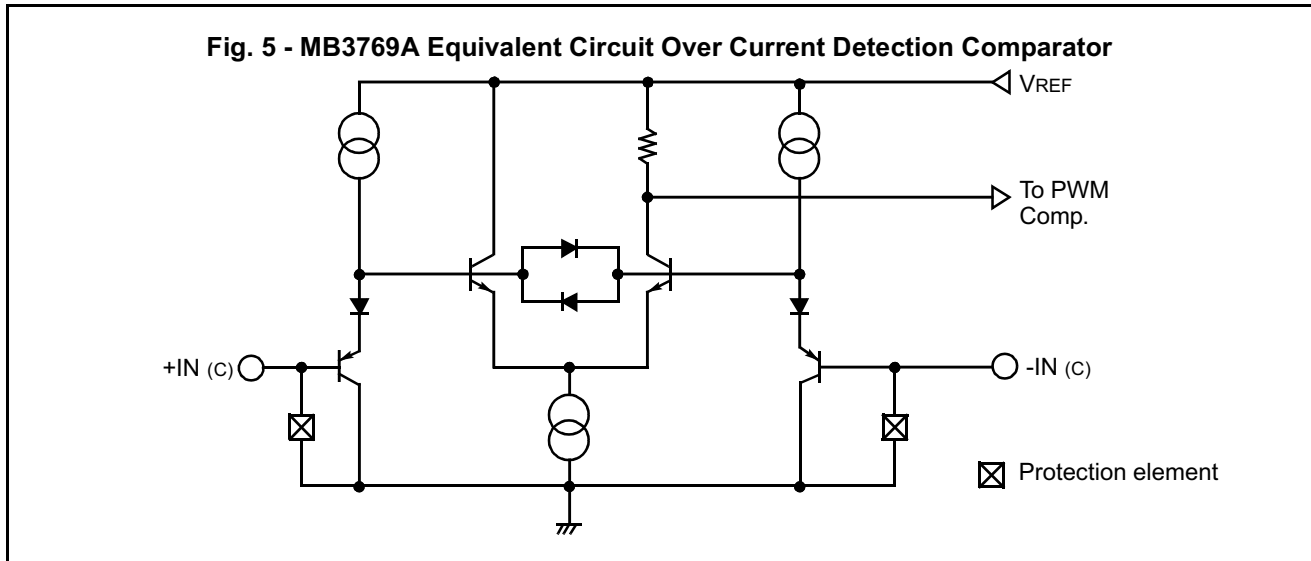

For the method of detecting overcurrents in the external transistor (FET), the output transistor can be protected against a shorted filter capacitor or power-on surge current.

The MB3769A uses dynamic current limiting to detect overcurrents in the output transistor (FET). A high-speed comparator and flip-flop are built-in.

To detect overcurrents, compare the voltage at +IN(C) of current detection resistor connected the source of the output transistor (FET), with the reference voltage (connected to -IN(C)) using a comparator. To prevent output oscillation during overcurrent, flip-flop circuit protects against double pulses occurring within a cycle.

The output of overcurrent detector is ORed with other signals at the PWM comparator. See the example "Application Example" for details on use.

Figure 5 shows the equivalent circuit of the over-current detection comparator.

3. DTC: Dead Time Control (Soft-Start and Quick Shutdown)

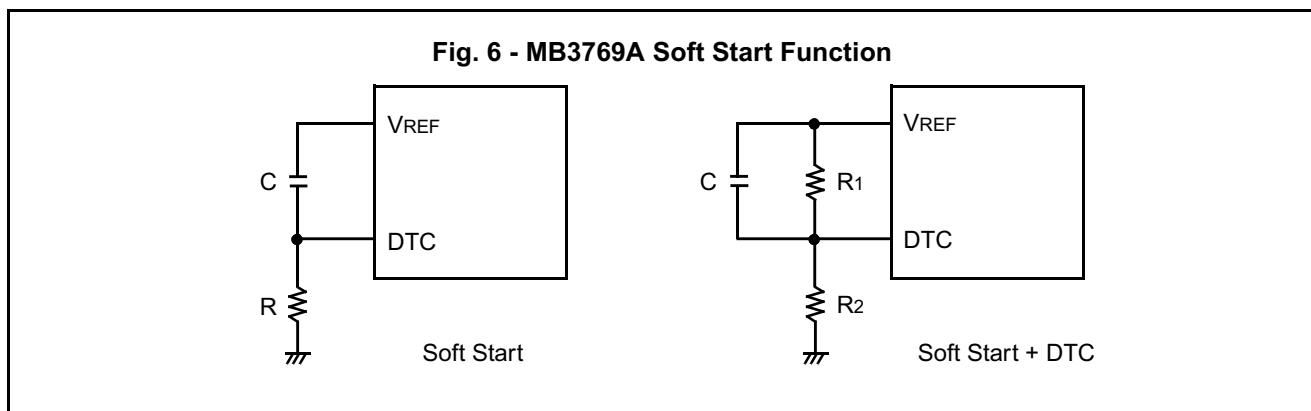

The dead time control terminal and the error amplifier output are connected to the PWM comparator.

The maximum duty cycle for V_{DTC} (voltage applied to pin 4) is obtained from the following formula (approximate value at low frequency):

$$\text{Duty Cycle} = (3.5 - V_{DTC}) \times 50 (\%) \quad [0\% \leq \text{duty cycle} \leq D_{MAX} (80\%)]$$

The dead time control terminal is used to provide soft start.

In Figure 6, the DTC terminal is connected to the V_{REF} terminal through R and C. Because capacitor C does not charge instantaneously when the power is turned on, the output transistor is kept turned off. The DTC input voltage and the output pulse width increase gradually according to the RC time constant so that the control system operates safely.

The quick shutdown function prevents soft start malfunction when the power is turned off and on quickly. After the power is shut down, soft start is disabled because the DTC terminal has low electric potential from the beginning if the power is turned on again before the capacitor is discharged. The MB3769A prevents this by turning on the discharge transistor to quickly discharge the capacitor in the stand-by mode.

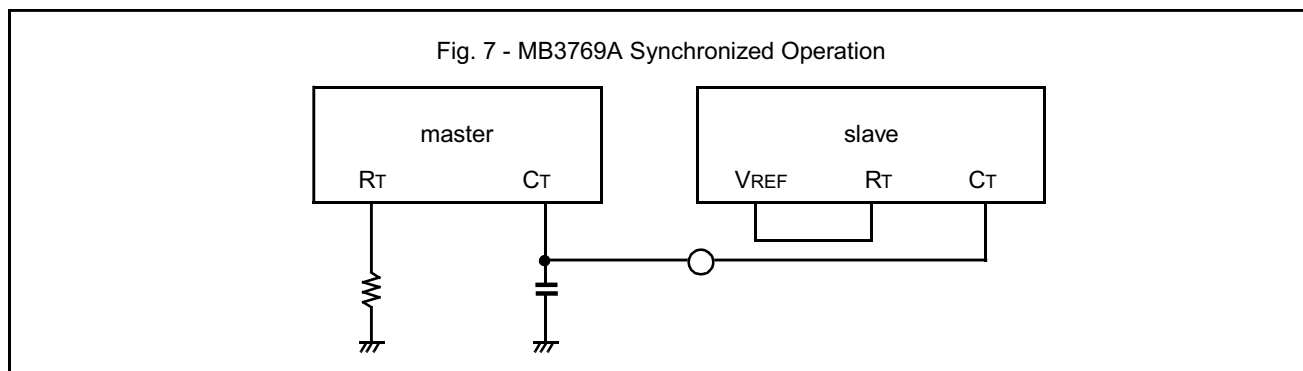

MB3769A

4. Triangular Wave Oscillator

The oscillation frequency is expressed by the following formula:

$$f_{osc} \approx \frac{1}{0.8 \times C_T \times R_T + 0.0002 \text{ ms}} \text{ [kHz]} \quad \begin{array}{l} C_T : \mu\text{F} \\ R_T : \text{k}\Omega \end{array}$$

For master/slave synchronized operation of several MB3769As, the C_T and R_T terminals of the master MB3769A are connected in the usual way and the C_T terminals of the master and slave device (s) are connected together. The slave MB3769A's R_T terminal is connected to its V_{REF} terminal to disable the slave's oscillator. In this case, set $50/n \text{ k}\Omega$ (n is the number of master and slave ICs) to the upper limit of R_T so that internal bias currents do not stop the master oscillation.

5. Overvoltage Detector

The overvoltage detection circuit shuts the system power down if the switching regulator's output voltage is abnormal or if abnormal voltage is appeared. The reference voltage is 2.5 V ($V_{REF} / 2$). The system power is shut down if the voltage at pin 13 rises above 2.5 V. The output is kept shut down by the latching circuit until the power supply is turned off (see Figure 3).

6. Stand-by Mode and Under-Voltage Lockout (UVLO)

Generally, $V_{GS} > 6$ to 8 V is required to use power MOSFET for switching. UVLO is set so that output is on at $V_{CC} \geq 10$ V (standard) when the power is turned on and is off at $V_{CC} \leq 8$ V (standard) when the power is turned off.

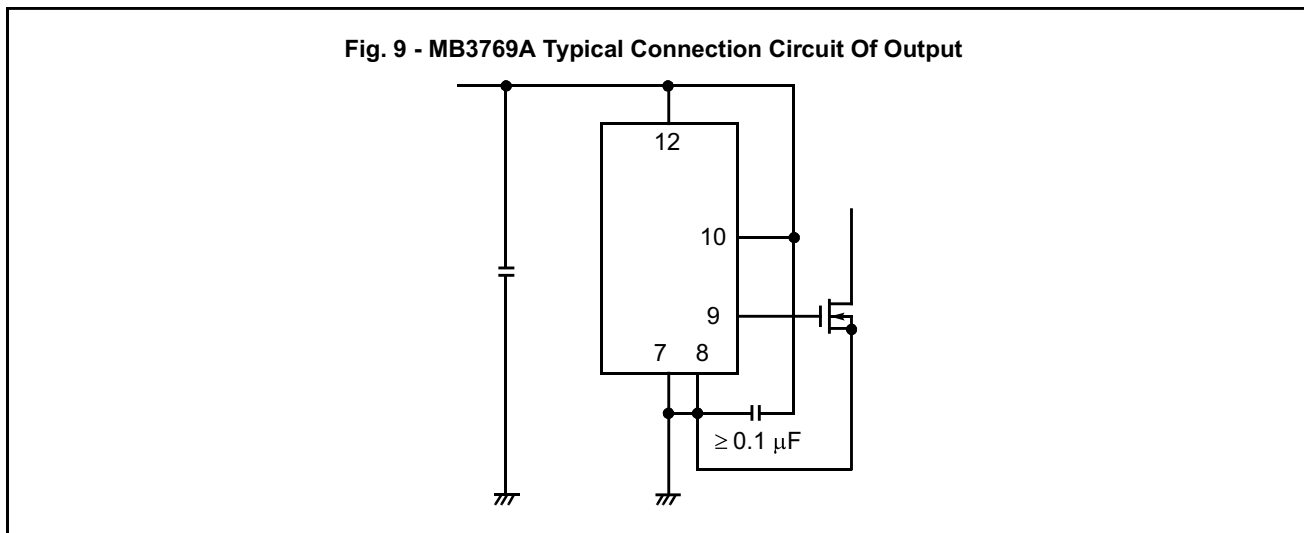

In the stand-by mode, the power supply current is limited to 2 mA or less when the output is inhibited by the UVLO circuit. When the MB3769A is operated from the 100 VAC line, the power supply current is supplied through resistor R (Figure 8). That is, the IC power supply current is supplied by the AC line through resistor R until operation starts. Current is then supplied from the transformer tertiary winding, eliminating the need for a second power supply.

Two volts (typical) of hysteresis are provided for return from operation mode to stand-by mode not to return to stand-by mode until output power is turned on or to avoid malfunction due to noise.

7. Output Section

Because the OUT terminal (pin 9) carries a large current, the collector and emitter of the output transistor are brought out to the V_H and V_L terminals. In principle, V_H is connected to V_{CC} and V_L is connected to GND, but V_H can be supplied from another power supply (4 V to 18 V). Note that V_L and GND should be connected as close to the IC package as possible. A capacitor of $0.1 \mu\text{F}$ or more is inserted between V_H and V_L (see Figure 9).

■ APPLICATION EXAMPLE

Overcurrent Protection Circuit

The waveform at the output FET source terminal is shown in Figure 11. The RC time constant must be chosen so that the voltage glitch in the waveform does not cause erroneous overcurrent detection. This time constant should be from 5 ns to 100 ns. A detection current value depends on R or C because a waveform is weakened. To keep this glitch as small as possible, the rectifiers on the transformer secondary winding must be the fast-recovery type.

Fig. 12 -Primary Control

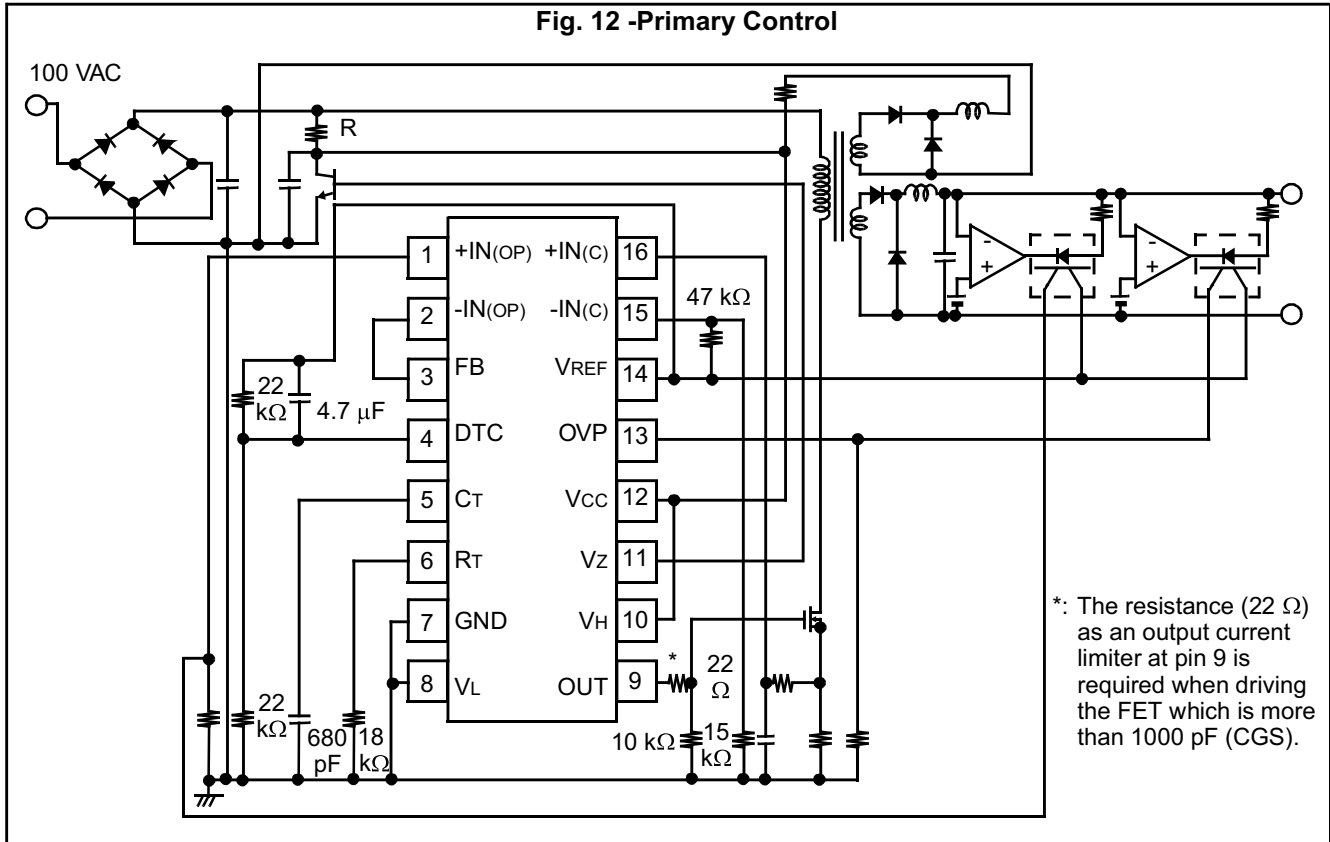

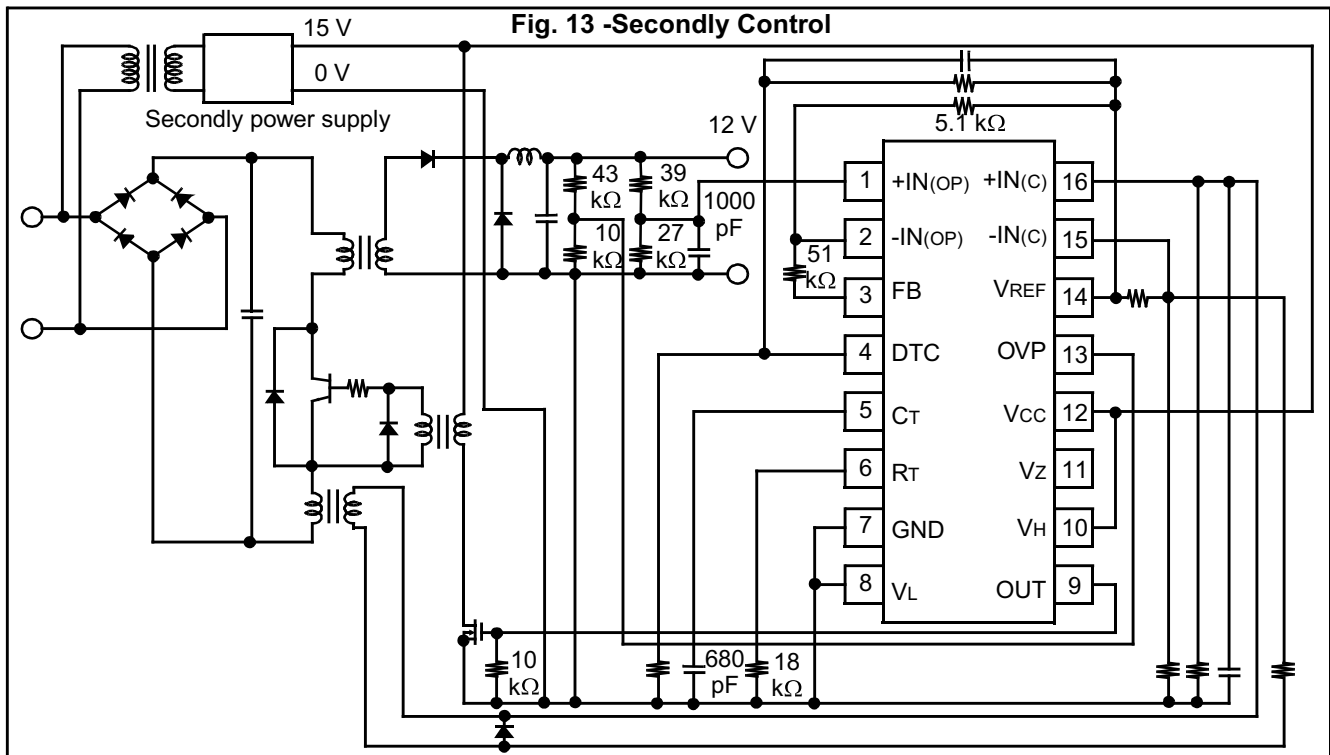

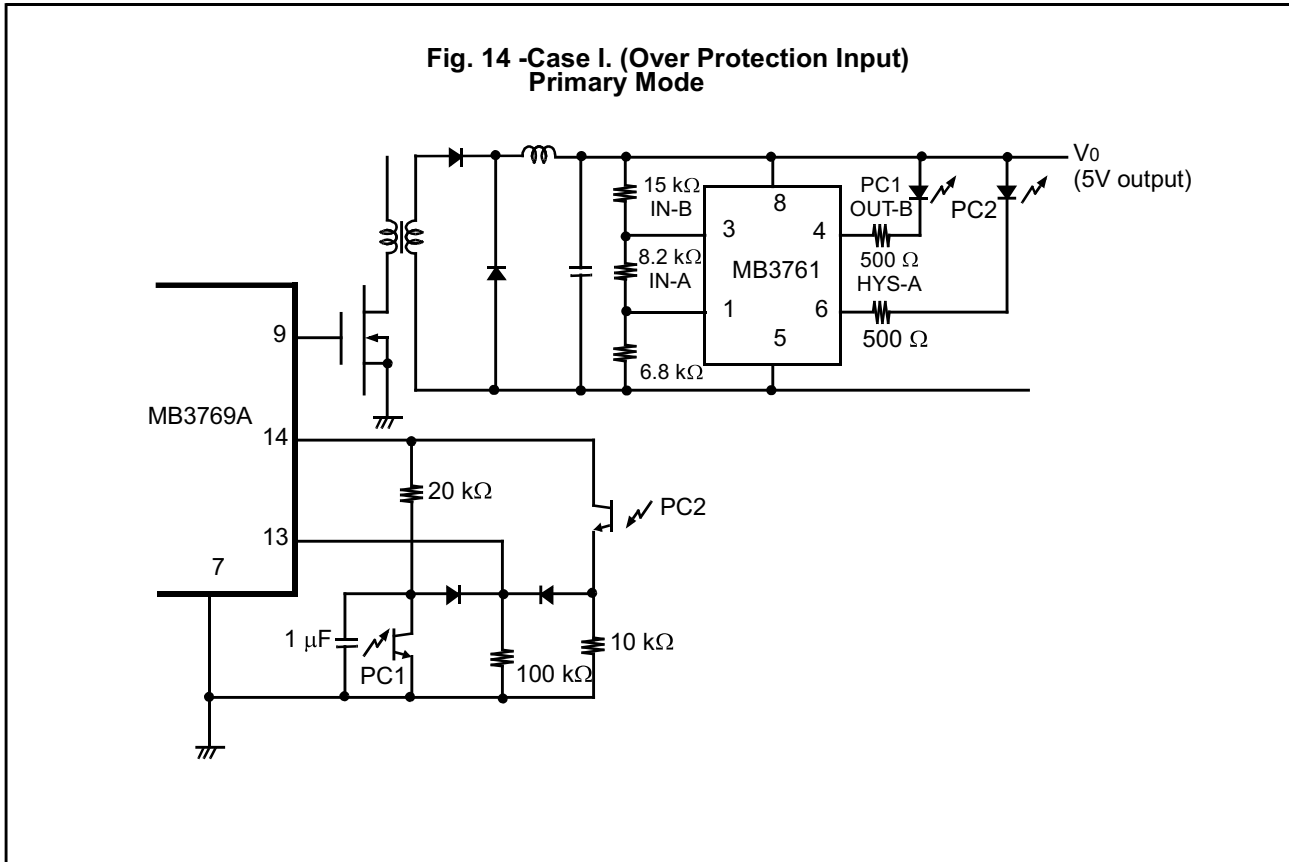

Fig. 13 -Secondly Control

SHORT PROTECTION CIRCUIT

The system power can be shut down to protect the output against intermittent short-circuits or continuous overloads. This protection circuit can be configured using the OVP input as shown in Figure 14.

■ HOW TO SYNCHRONIZE WITH OUTSIDE CLOCK

The MB3769A oscillator circuit is shown in Figure 16. C_T charge and discharge currents are expressed by the following formula:

$$I_{CT} = \pm 2 \times I_1 = \pm \frac{5V}{R_T}$$

This circuit shows that if the voltage at the C_T terminal is set to 1.5 V or less, one oscillation cycle ends and the next cycle starts. An example of an external synchronous clock circuit is shown in Figure 17.

The Figure 18 shows the C_T terminal waveform.

V_{TH} may be near 2.5 V. In this case, the maximum duty cycle is restricted as shown in the formula below if $t_{P'} = 0$.

$$D_{max} = \frac{(3.5 - 1.85) + (3.5 - V_{TH})}{(3.5 - V_L) + (3.5 - V_{TH})} \leq 59\% \quad (V_L = 0V: \text{No clamp circuit})$$

When $V_{TH} = 2.5V$, C_T can be provided by followings.

$$t_{cycle} - t_P = \frac{1}{f_{osc}} \times \frac{(3.5 - V_L) + (3.5 - V_{TH})}{f_{osc}(3.5 - 1.5) \times 2}$$

MB3769A

$$f_{OSC} \approx \frac{1}{0.8 \times C_T \times R_T}$$

$$C_T \approx \frac{1}{0.8 \times R_T} \times \frac{4}{4.5 - V_L} \quad (t_{cycle} - t_P) \text{ [pF]} \quad (R_T: \text{k}\Omega, t_{cycle}, t_P: \text{ns})$$

Make V_L high for a large duty cycle for the clamp circuit. The circuits below can be used because the clamp voltage must be much lower than 1.5 V.

In circuit A, R_1 and R_2 must be determined considering the effects of t_P , R , or R_T .

The transistor saturation voltage must be very small (<0.15 V) for any clamp circuit, so a transistor with a very small $V_{CE(sat)}$ should be used.

■ NOTES ON USE

- Take account of common impedance when designing the earth line on a printed wiring board.
- Take measures against static electricity.
 - For semiconductors, use antistatic or conductive containers.
 - When storing or carrying a printed circuit board after chip mounting, put it in a conductive bag or container.
 - The work table, tools and measuring instruments must be grounded.
 - The worker must put on a grounding device containing 250 kΩ to 1 MΩ resistors in series.
- Do not apply a negative voltage
 - Applying a negative voltage of -0.3 V or less to an LSI may generate a parasitic transistor, resulting in malfunction.

■ ORDERING INFORMATION

Part number	Package	Remarks
MB3769APF-□□□	16-pin plastic SOP (FPT-16P-M06)	Conventional version
MB3769APF-□□□E1	16-pin plastic SOP (FPT-16P-M06)	Lead Free version

■ RoHS Compliance Information of Lead (Pb) Free version

The LSI products of Fujitsu Microelectronics with “E1” are compliant with RoHS Directive , and has observed the standard of lead, cadmium, mercury, Hexavalent chromium, polybrominated biphenyls (PBB) , and polybrominated diphenyl ethers (PBDE) .

The product that conforms to this standard is added “E1” at the end of the part number.
