

# Micropower Precision Triple Supply Monitor with Push-Pull Reset Output in a 5-Lead SOT-23 Package

## FEATURES

- **Monitors Three Inputs Simultaneously: 3V, 1.8V and Adjustable**
- **±1.5% Threshold Accuracy Over Temperature**
- **Very Low Supply Current: 10 $\mu$ A Typ**
- 200ms Reset Time Delay
- Power Supply Glitch Immunity
- Guaranteed  $\overline{\text{RESET}}$  for  $V_{\text{CC3}} \geq 1\text{V}$  or  $V_{\text{CC18}} \geq 1\text{V}$
- **3V Active-Low Push-Pull Reset Output**
- 5-Lead SOT-23 Package

## APPLICATIONS

- Desktop Computers
- Notebook Computers
- Intelligent Instruments
- Portable Battery-Powered Equipment
- Network Servers

## DESCRIPTION

The LTC<sup>®</sup>1985-1.8 is a triple supply monitor intended for systems with multiple supply voltages. The reset output remains low until all three supplies have been in compliance for 200ms. Tight 1.5% accuracy specifications and glitch immunity ensure reliable reset operation without false triggering.

The  $\overline{\text{RST}}$  output is guaranteed to be in the correct state for  $V_{\text{CC18}}$  or  $V_{\text{CC3}}$  down to 1V. The LTC1985 may also be configured to monitor any one or two  $V_{\text{CC}}$  inputs instead of three, depending on system requirements.

Very low (10 $\mu$ A typical) supply current makes the LTC1985 ideal for power conscious systems.

The LTC1985 is available in a 5-lead SOT-23 package.

 LTC and LT are registered trademarks of Linear Technology Corporation.

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

**Note 2:** All voltage values are with respect to GND.

**Note 3:** The LTC1985E is guaranteed to meet specified performance from 0°C to 70°C and is designed, characterized and assured to meet the

extended temperature limits of -40°C to 85°C but are not tested at these temperatures.

**Note 4:** Both  $V_{CC3}$  and  $V_{CC18}$  can act as the supply depending on which pin has the greatest potential.

**Note 5:** Measured from when input passes through the input threshold voltage ( $V_{RTX}$ ) until  $\overline{RST}$  passes through 1.5V.

## PIN FUNCTIONS

**RST (Pin 1):** Reset Logic Output. Active low, 3V push-pull output. Asserted when one or all of the supplies are below trip thresholds and held for 200ms after all supplies become valid.

**GND (Pin 2):** Ground.

**V<sub>CCA</sub> (Pin 3):** 1V Sense, High Impedance Input. If unused it can be tied to either V<sub>CC3</sub> or V<sub>CC18</sub>.

**V<sub>CC18</sub> (Pin 4):** 1.8V Sense Input and Power Supply Pin. This pin is used on the LTC1985 to provide power to the part when the voltage on V<sub>CC18</sub> is greater than the voltage on V<sub>CC3</sub>. Bypass to ground with a  $\geq 0.1\mu F$  ceramic capacitor.

**V<sub>CC3</sub> (Pin 5):** 3V Sense Input and Power Supply Pin. This pin provides power to the part when the voltage on V<sub>CC3</sub> is greater than the voltage on V<sub>CC18</sub>. Bypass to ground with a  $\geq 0.1\mu F$  ceramic capacitor.

## APPLICATIONS INFORMATION

### Supply Monitoring

The LTC1985 is a low power, high accuracy triple supply monitoring circuit with a single 200ms microprocessor reset output.

All three  $V_{CC}$  inputs must be above predetermined thresholds for reset not to be invoked. The LTC1985 will assert reset during power-up, power-down and brownout conditions on any one or all of the  $V_{CC}$  inputs.

### 3V or 1.8V Power Detect

The LTC1985 is powered from the 3V input pin ( $V_{CC3}$ ) or the 1.8V input pin ( $V_{CC18}$ ), whichever pin has the highest potential. This ensures the part pulls the  $\overline{RST}$  pin low as soon as either input pin is  $\geq 1V$ .

### Power-Up

Upon power-up, either the  $V_{CC18}$  or  $V_{CC3}$  pin, can power the part. This ensures that  $\overline{RST}$  will be low when either  $V_{CC18}$  or  $V_{CC3}$  reaches 1V. As long as any one of the  $V_{CC}$  inputs is below its predetermined threshold,  $\overline{RST}$  will stay a logic low. Once all of the  $V_{CC}$  inputs rise above their thresholds, an internal timer is started and  $\overline{RST}$  is driven high after 200ms.

$\overline{RST}$  is reasserted whenever any one of the  $V_{CC}$  inputs drops below its predetermined threshold and remains asserted until 200ms after all of the  $V_{CC}$  inputs are above their thresholds.

### Power-Down

On power-down, once any of the  $V_{CC}$  inputs drop below its threshold,  $\overline{RST}$  is held at a logic low. A logic low of 0.3V is guaranteed until both  $V_{CC3}$  and  $V_{CC18}$  drop below 1V.

Figure 1. Typical Application Showing Resistor on  $\overline{RST}$  Output to Ground

### Override Functions

The  $V_{CCA}$  pin, if unused, can be tied to either  $V_{CC3}$  or  $V_{CC18}$ . This is an obvious solution since the trip points for  $V_{CC3}$  and  $V_{CC18}$  will always be greater than the trip point for  $V_{CCA}$ . Likewise, the  $V_{CC18}$ , if unused, can be tied to  $V_{CC3}$ .  $V_{CC3}$  must always be used. Tying  $V_{CC3}$  to  $V_{CC18}$  and operating off of a 1.8V supply will result in the continuous assertion of  $\overline{RST}$ .

### Ensuring $\overline{RST}$ Valid for Supply Voltages Under 1V

When the supplies drops below 1V the  $\overline{RST}$  output current sink capability is drastically reduced. The combination of stray currents and stray capacitance to signals other than ground can cause the  $\overline{RST}$  output pin to float around. In a lot of applications this is not a problem since most microprocessors and other circuits do not operate with the supply voltage less than 1V. In applications where the  $\overline{RST}$  output must be valid down to 0V the addition of a pull-down resistor from  $\overline{RST}$  to ground will ensure  $\overline{RST}$  is held low. The circuit in Figure 1 shows an application employing this technique. The value chosen for the pull-down resistor ( $R3$ ) is a trade-off between pull-down strength and loading of the  $\overline{RST}$  pin. If the value of the resistor is too large the pin may still float and if the resistor value is too low it may load down the  $\overline{RST}$  as well as burn excess supply current, a value of 100k is a good compromise.

Figure 2.  $\overline{RST}$  Voltage vs  $V_{CC3}$  with a 100k Resistor on  $\overline{RST}$  to Ground

# TYPICAL APPLICATIONS

**Triple Supply Monitor (3V, 1.8V and Adjustable)**

\*TO PRESERVE THRESHOLD ACCURACY, SET PARALLEL COMBINATION OF R1 AND R2  $\leq 66.5k$

**Dual Supply Monitor (3V and 1.8V, Defeat V<sub>CCA</sub> Input)**

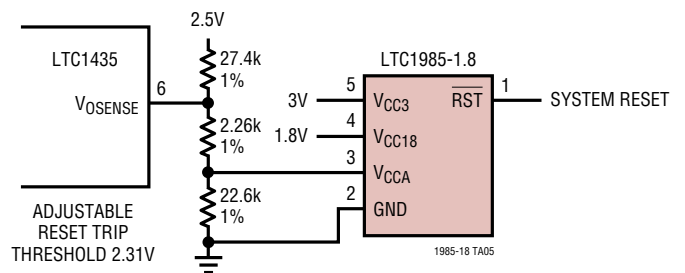

**Dual Supply Monitor (3V Plus Adjustable)**

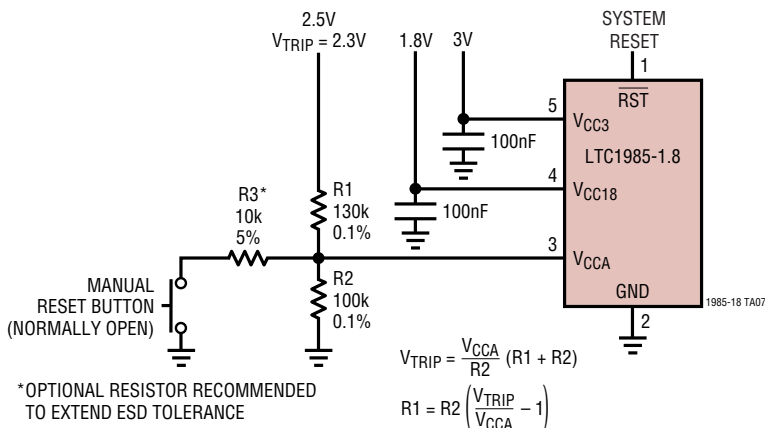

\*TO PRESERVE THRESHOLD ACCURACY, SET PARALLEL COMBINATION OF R1 AND R2  $\leq 66.5k$

**Using V<sub>CCA</sub> Tied to DC/DC Feedback Divider**
