## SSTL16877

### FEATURES

- Stub-series terminated logic for 2.5 V VDDQ (SSTL\_2)
- Optimized for DDR (Double Data Rate) SDRAM applications
- Supports SSTL\_2 signal inputs and outputs
- Flow-through architecture optimizes PCB layout
- Meets SSTL\_2 class I and class II specifications
- Latch-up protection exceeds 500mA per JEDEC Std 17
- ESD protection exceeds 2500 V per MIL STD 833 Method 3015 and 200 V per Machine Model
- Full DDR1 PC333 solution @ 2.5 V when used with PCKV857
- Mixed 2.5 V (PC266) / 3.3 V (PC333) solution when used with PCK857
- Same form, fit, and function as SSTV16857

### DESCRIPTION

The SSTL16877 is a 14-bit SSTL\_2 registered driver with differential clock inputs, designed to operate between 2.3 V and 2.7 V.  $V_{DDQ}$  must not exceed  $V_{CC}$ . Inputs are SSTL\_2 type with  $V_{REF}$  normally at  $0.5 \cdot V_{DDQ}$ . The outputs support class I which can be used for standard stub-series applications or capacitive loads. Master reset (RESET) asynchronously resets all registers to zero.

The SSTL16877 is intended to be incorporated into standard DIMM (Dual In-Line Memory Module) designs defined by JEDEC, such as DDR (Double Data Rate) SDRAM or SDRAM II Memory Modules. Different from traditional SDRAM, DDR SDRAM transfers data on both clock edges (rising and falling), thus doubling the peak bus bandwidth. A DDR DRAM rated at 166 MHz will have a burst rate of 333 MHz. The modules require between 23 and 27 registered control and address lines, so two 14-bit wide devices will be used on each module. The SSTL16877 is intended to be used for SSTL\_2 input and output signals.

The device data inputs consist of differential receivers. One differential input is tied to the input pin while the other is tied to a reference input pad, which is shared by all inputs.

The clock input is fully differential to be compatible with DRAM devices that are installed on the DIMM. However, since the control inputs to the SDRAM change at only half the data rate, the device must only change state on the positive transition of the CLK signal. In order to be able to provide defined outputs from the device even before a stable clock has been supplied, the device must support an asynchronous input pin (reset), which when held to the LOW state will assume that all registers are reset to the LOW state and all outputs drive a LOW signal as well.

### QUICK REFERENCE DATA

GND = 0 V;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $t_r = t_f \leq 2.5\text{ ns}$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL	UNIT
$t_{PHL}/t_{PLH}$	Propagation delay; CLK to Qn	$C_L = 30\text{ pF}$ ; $V_{DDQ} = 2.5\text{ V}$	2.4	ns
$C_I$	Input capacitance	$V_{CC} = 2.5\text{ V}$	2.9	pF

#### NOTE:

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ )  $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$  where:  
 $f_i$  = input frequency in MHz;  $C_L$  = output load capacity in pF;  $f_o$  = output frequency in MHz;  $V_{CC}$  = supply voltage in V;  
 $\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of the outputs.

SYMBOL	PARAMETER	CONDITION	LIMITS		UNIT
			MIN	MAX	
$V_{CC}$	DC supply voltage		-0.5	+4.6	V
$I_{IK}$	DC input diode current	$V_I < 0\text{ V}$		-50	mA
$V_I$	DC input voltage <sup>3</sup>		-0.5	$V_{DDQ} + 0.5$	V
$I_{OK}$	DC output diode current	$V_O < 0\text{ V}$		-50	mA
$V_{OUT}$	DC output voltage <sup>3</sup>	Note 3	-0.5	$V_{DDQ} + 0.5$	V
$I_{OUT}$	DC output current	$V_O = 0\text{ V}$ to $V_{DDQ}$		$\pm 50$	mA
	Continuous current <sup>4</sup>	$V_{CC}$ , $V_{DDQ}$ , or GND		$\pm 100$	
$T_{stg}$	Storage temperature range		-65	+150	°C

### NOTES:

- Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability. The maximum junction temperature of this integrated circuit should not exceed 150°C.
- The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
- The continuous current at  $V_{CC}$ ,  $V_{DDQ}$ , or GND should not exceed  $\pm 100$  mA.

## Definitions

**Short-form specification** — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

**Limiting values definition** — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

**Application information** — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

## Disclaimers

**Life support** — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

**Right to make changes** — Philips Semiconductors reserves the right to make changes in the products—including circuits, standard cells, and/or software—described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
